No. 995—Cedar Rapids, Iowa—This contract (p. 76), which provides for furnishing the Board of Education with 5000 tons of bituminous and 60 tons of anthracite, has been awarded as follows: **E. E. Pinney Coal Co.,** screenings, $1.91; **W. G. Black Co.,** anthracite, $8.96; **Hawkeye Lumber & Coal Co.,** lump, $3.60. The screenings are to come from Rosehill, Iowa, and the lump from Pyrolite. Address Secy. H. L. Cooper, Bd. of Edu., Cedar Rapids, Iowa.

+No. 998—Kansas City, Kan.—This contract (p. 77), which provides for furnishing the Water Works with approximately 20,000 tons of mill and slack coal has been awarded to the **Wyandotte Coal & Lime Co.,** at $2.20 for Cherokee mill and $2.05 for Cherokee slack coal. The same company obtained the business last year at $2.25 per ton for both mill and slack. Most of the coal will be slack coal. The gross consideration amounts to about $55,000. Address Purch. Agt. Amos Riddle, City Hall, Kansas City, Kan.

+No. 999—Brookville, Ohio—This contract (p. 77), which provides for furnishing the Board of Education with 75 tons of coal, has been awarded to **Theo. Detwiler,** on Pocahontas No. 3 mine-run, at $3.20 per ton. Address Clk. J. M. Grau, Bd. of Edu., Brookville, Ohio.

1002—Lafayette, Ind.—This contract (p. 77), which provides for furnishing the fuel requirements of the Public Works Dept., has been awarded to the **J. M. Clark Coal Co.,** of Lafayette, Ind., on coal from their Lattas Creek mine, which operates on the Linton No. 4 seam, on the following basis: 5000 tons nut, pea and slack, $1.53; 700 tons of mine-run, $2.18; 275 tons of mine-run at $2.08. Address Supt. M. W. Miller, Water Works Dept., Lafayette, Ind.

+1008—Galesburg, Ill.—This contract (p. 77), which provides for furnishing the Knox County Court House and heating plant with coal during the year beginning July 1, has been awarded to the **Spoon River Colliery Co.** and the **Virden Coal Co.** It is understood that the price is $1.65 per ton on a delivered basis for Peoria egg screenings. Address County Clk. F. L. Adams, Galesburg, Ill.

+1011—Ritzville, Wash.—This contract (p. 77), which provides for furnishing the various school buildings with 125 tons of coal has been awarded to the **St. Paul & Tacoma Lumber Co.** at $5.20 per net ton for Roslyn Cascade Special steam coal. Address Dist. Clk. John Truax, School Dist. No. 1, Ritzville, Wash.

1013—Jackson, Miss.—This contract (p. 77), which provides for furnishing the State Penitentiary with coal, has been awarded as follows: **Memphis Coal Co.,** for delivery at Parchman, Miss., $3.50; **Morrison Coal Co.,** for delivery at Oakley, mine-run, $2.95. Address Secy. J. J. Coman, Mississippi State Penitentiary, Jackson, Miss.

1014—Keewatin, Minn.—This contract (p. 77), which provides for furnishing the town government with approximately 5000 tons of coal, has been awarded to the **King Lumber Co.** on the following basis:

	Lump	Mine-run	Screenings
Kentucky Elkhorn............	$4.89	$4.59	$3.95
Kentucky screenings	4.89	4.59	3.95
Youghiogheny screenings......	4.54	4.24	3.64

Address Village Clk. C. W. Extrum, Keewatin, Minn.

+No. 1017—Mobile, Ala.—This contract (p. 77), which provides for furnishing a year's supply of coal to be delivered at the Spring Hill and Bienville Pumping Stations, has been awarded to the **Imperial Coal & Coke Co.** at $2.95 per ton delivered at the stations. The contract will be filled on washed screened nut, ¾x3½ in. with a guaranteed B.t.u. value of 15,050 and a maximum ash content of 1¾%. Address Supt. C. W. Joost, Mobile Water Works, Mobile, Ala.

+1027—Rapids City, S. D.—This contract (p. 115), which provides for furnishing the Independent School District with approximately 200 tons of coal has been awarded to **Thomas Roush.** The complete list of bids and prices were as follows:

Bidder	Coal	Lump	Egg	Nut
Rapids City Fuel Co.....	Sheridan	$4.40	$4.15	$3.65
Thomas Roush	Poposia	4.25	4.00	3.65
Mid West L. & C. Co.....	Kooi	4.25	4.00	

*Bids on Colorado coal ran from $6.75 to $7.25 per ton. Address Secy. W. F. Haafke, Ind. School District, Rapids City, S. D.

+1066—Pella, Iowa—This contract (pp. 116, 198), which provides for furnishing the local city electric light plant with lump, mine-run and steam coal has been awarded to the **Pella Coal Co.,** on the following basis: Lump, $2.93; mine-run, $2.75; steam, $1.65. Address City Clk. A. C. Kuyper, Pella, Iowa.

+1067—Springfield, Ohio—This contract (p. 117), which provides for furnishing the County Commissioners with approximately 800 tons of coal, has been awarded to **Chas. E. Grube Co.,** 400 tons for the County Infirmary, at $2 per ton, and **Beckmley & Myers**, 400 tons for the Donnelsville Station, at $2.55 per ton. Address County Audr. J. M. Pierce, Springfield, Ohio.

+1069—Olivia, Minn.—This contract (p. 117), which provides for furnishing the local Board of Education with 100 tons of Youghiogheny lump coal was awarded to **William Windhorst**, the lowest bidder at $5.77 per ton. Address, Secy. Geo. E. Peterson, Bd. of Edu., Olivia, Minn.

+No. 1072—Wadena, Minn.—This contract (p. 117), which provides for furnishing the City Government with approximately 1000 tons of Youghiogheny mine-run coal, has been divided equally among the Denver Lumber Co., the Ebner Milling Co., and the Gnest Lumber Co., all of whom bid $3.10 per ton. The Monarch Elevator Co. bid $3.02 per ton, but the bid was rejected. Address Village Rec. A. C. Murray, Wadena, Minn.

+1073—Bridgeport, Conn.—This contract (p. 117), which provides for furnishing the City Department with approximately 500 tons of bituminous coal has been awarded to **Vincent Bros.**, of this place, at $3.74 per gross ton. This compares with $3.80 per ton last year. Address, City Clerk, Bridgeport, Conn.

1074—Buffalo, N. Y.—This contract (p. 117), which provides for furnishing the local Light House Department with coal, has been awarded to the **Ashtabula Steamship Co.**, of Buffalo, at $2.80 per ton for bituminous coal. Address Lighthouse Inspector Roscoe House, Buffalo, N. Y.

+1075—Louisville, Ky.—This contract (p. 117), which provides for furnishing the Louisville Industrial School of Reform with approximately 1000 tons of coal has been awarded to the **James & Dugan Coal Co.** on Harlan Co., Ky., nut at $2.65 per short ton. Address Secy. C. F. Leathers, Louisville Ind. School of Reform, Louisville, Ky.

+1078—Ionia, Mich.—This contract (p. 117), which provides for furnishing the Ionia State Hospital with approximately 2500 tons of bituminous nut, pea and slack coal has been awarded to **E. J. Corbett** at $2.48 per ton. This is the same party who had the contract during the past year. Address Medical Supt. Dr. R. H. Haskell, Ionia State Hospital, Ionia, Mich.

1082—Sioux Falls, S. D.—This contract (p. 117), which provides for furnishing about 1000 tons of coal, has been awarded to **H. T. Parmley**, of this place, on Elkhorn, Ky., coal at $5.10 per ton for screenings and $5.75 for mine-run. Address City Audr. Walter C. Leyse, Sioux Falls, S. D.

+1083—Richmond, Ind.—This contract (p. 117), which provides for furnishing the Wayne County Commissioners with coal, has been awarded to the following companies: **A. Harsh Coal Co.**, $3.05; **H. C. Bullerdick & Son**, $3.33; **Hackman & Klefoth**, $3.35; **Mather Bros. Co.**, $3.05. Address Audr. L. S. Bowman, County Comrs., Richmond, Ind.

+1084—New Lexington, Ohio—This contract (p. 117), which provides for furnishing the Board of Education with coal, has been awarded to **J. M. McCullough**, at $2.85 for lump coal. Delmar Spring bid $2.87½, and M. R. Hearing, $3.25 per ton. Address Clk. C. O. Ferguson, Bd. of Edu., Pleasant Township, New Lexington, Ohio

Contract Notes

York, Penn.—The contract for furnishing the local court house and county jail with coal was awarded to **W. T. Gerber** at $2.95 per ton for Miller vein coal.

Greensburg, Penn.—It is stated here that Pres. Jamison of the Jamison Coal & Coke Co., has closed a large contract for coal to be furnished the French Government.

Dubuque, Iowa—The contract for furnishing the local schools with coal during the ensuing year has been awarded to **Felix G. Becker** and **F. A. Burns**, the lowest bidders.

West Chester, Penn.—The contract for delivery of 300 tons of Lykens Valley pea coal to the Chester County Hospital has been awarded to **John H. Spear & Sons** at $4.54 per gross ton.

Birmingham, Ala.—In addition to previous contracts of this company (No. 598, Vol. 8, pp. 40, 78), the United Fruit Co. is said to have just closed a contract for 40,000 tons with the De Bardeleben Coal Co.

Pere Marquette R.R.—The fuel contract of this road has been let on Island Creek coal, it is understood at 75c. at the mines. The contract was divided among a number of operators in the Island Creek district.

Coke for Export—A commercial representative of a foreign government in Washington, D. C., reports that he is in receipt of requests for the name and addresses of American exporters of coke. Large quantities are desired.

Birmingham, Ala.—Press reports are to the effect that the Georgia Southern & Florida R.R. have closed their contract with the Sloss-Sheffield Steel & Iron Co. for 150,000 tons of coal to be furnished during the ensuing year.

Greenville, Penn.—The contract for furnishing the local schools with coal has been awarded to **N. W. Whitney** at $2.25 for screened lump at bank. The haulage charge will be 74c. Address Secy. I. C. Brown, School Bd., Greenville, Penn.

Walla Walla, Wash.—The contract for furnishing the local Board of Education with 600 tons of coal has been awarded to **Tausick & Kauffman** and **Arthur Thompson.** It is said the contract will be filled on Spring Cannon and Kemmerer grades.

New York, N. Y.—Pattison & Bowns have been awarded a contract for furnishing and delivering 3000 tons of egg coal to the Department of Docks and Ferries at $5.37 per ton. Streat Coal Co. bid $5.94; Gavin-Rowe bid $5.46; and W. P. W. Haff, $5.57.

Portsmouth, Ohio—The Whitaker Glessner Co. at this place consumes about 3000 tons of mine-run coal per year. Deliveries are by railroad at the rate of 60 tons per week. Address Pur. Agt. J. E. Thomas, Whitaker Glessner Co., Portsmouth, Ohio.

Berrien Springs, Mich.—The Emmanuel Missionary College buys their coal in the open market and their requirements for the ensuing year have already been covered. Address Asst. Mgr. Fred Green, Emmanuel Missionary College, Berrien Springs, Mich.

Wyndmoor, Penn.—The Springfield Township School Board has awarded the contract for the delivery of 160 tons of Lehigh stove coal to the schools of Wyndmoor, Whitemarsh, Oreland and Flourtown to **Zebedee Comly**, Flourtown, Penn., at price of $6.22 delivered in the cellars of the buildings.

Kansas City, Mo.—The contract for furnishing the local Water Works with coal, has been awarded to the Central Coal & Coke Co. at $2.20 per ton for mill and $2.05 for slack. The price for slack coal is the same this year as last, but the figure on mill coal represents a reduction of 14c. per ton. About 35,000 tons of coal is used altogether.

Weirton, W. Va.—The Phillips Sheet & Tin Plate Co. at this place consume 100,000 tons of slack, 20,000 tons of three quarter lump, and 5000 tons of mine-run coal per annum. Deliveries are made over the Pennsylvania and Wheeling & Lake Erie, at about the following rate per week: 400 tons of three-quarter; 100 tons of mine-run; 2000 tons of slack. The company has storage capacity for three days. Address Purchasing Agent J. F. Newman, Phillips Sheet & Tin Plate Co., Weirton, W. Va.

Portland, Me.—Randall & McAllister were awarded contract for supplying coal to the City of Portland as follows: Hard coal broken, white ash, $6.85; egg, $7.10; stove, $7.10; nut, $7.35; pea, $5.85. Soft coal: Pocahontas, $4.80; New River, $4.90; Big Vein Georges Creek Cumberland, $5. The other bidder was A. R. Wright Co. as follows: Broken, $6.90; egg and stove, $7.10; nut, $7.40; pea, $5.85; hard coal screenings, $2.25. Bituminous: Pocahontas or Georges Creek Cumberland, $5.10.

Indianapolis, Ind.—The Indianapolis Coal Co. and the Indianapolis Mortar & Fuel company were the only bidders for the contract to supply coal for the ensuing year to the police and fire departments. The former bid $3.25 for mine-run Pocahontas; $4.25 for Pocahontas lump; $3.15 for Kanawha lump and $7.25 for anthracite. The latter bid $3.25 for Pocahontas mine-run; $4.24 for Pocahontas lump; $3.34 for Kanawha lump and $7.24 for anthracite. The Indianapolis Mortar & Fuel Co. secured the contract over the protest of its competitor who insisted that as much more Kanawha was used than the other coals, its bids were the cheapest.

Columbus, Ohio—The contract for 15,000 tons of coal for the Ohio State University for the coming winter has been awarded to the **Lorain Coal & Dock Co.**, of Columbus at $1.19 for West Virginia nut and slack, delivered on the university switch. Other bids were: A. Simons & Son, Columbus, $1.35 for West Virginia nut and slack; Easthill Coal Co., Cincinnati, $1.39 for West Virginia nut and slack; Elk Coal Co., Columbus, $1.42 for West Virginia nut and slack; Halmar Coal Mining Co., Cincinnati, $1.16 for West Virginia nut and slack; Victoria Coal Co., Columbus, $1.15 for Hocking nut and slack; Chesapeake & Ohio Coal Co., Cincinnati, $2.15 for Pocahontas nut and slack and Moreland Coke Co., Cincinnati, $1.34¾ for West Virginia nut and slack. The contract was awarded to the Lorain Coal & Dock Co. because of a better analysis and will be shipped from the newly opened Logan County field. The university has facilities for the storage of between 1000 and 1200 tons and this will be filled and coal will then come forward at the rate of about three cars daily during the cold months.

COAL AGE

Vol. 8 NEW YORK, AUGUST 21, 1915 No. 8

NEPOTISM

PRESIDENT JAMES of the University of Illinois has very decided views on nepotism, which were made public recently. When he learned that his daughter was engaged to be married to Professor Frazier, who held the position of controller of the University of Illinois, he declared he would be very proud to have the professor for a son-in-law, but that he would have no relative by blood or marriage on the faculty of which he was president.

As it was a case of "the girl or your job," Professor Frazier resigned and immediately secured an important position with a large Chicago mail-order concern.

President James' principle is to be admired, and there is no reason why its application should not to some extent be considered in other industries. Would it not help to increase the efficiency and stability of a coal-mining organization, for instance, by introducing it into the mines, in the operating and sales offices and the important and minor official positions?

Nepotism and "pull" mean pretty much the same thing, and we know of nothing that will kill the ambition of the hard-working and capable individual more quickly than the practice of this evil.

To convey the full meaning of nepotism more emphatically, let us quote President James: "*Nepotism is an unmitigated evil. No man is a fair judge of the abilities or services of his own children or relatives. He is liable to overvalue them, or in his attempt to be just, he may lean backward and do them an injustice.*"

The majority of "Coal Age" readers no doubt will concede that President James' idea is reasonable and broad-minded and will admit that the more general use of his principle in all branches of industry would tend to promote harmony and efficiency to greater and better results.

Ideas and Suggestions

How To Reduce Competition and Thus Avoid Waste

By Frank I. Pearce*

In the mining of coal in this country probably one-third of the bituminous coal and one-half of the anthracite are left in the mine. Better methods of mining have reduced past losses, and there is prospect of further improvement; but it is estimated that since the mining of coal commenced in this country, fully 3,000,000,000 tons of bituminous and 2,000,000,000 tons of anthracite coal have been left in the ground.

This can only be recovered with an increased danger and at an expense which makes its extraction highly improbable. To most people, especially those who are not miners, and to some who are, it is interesting to know why there is so much coal wasted in mining. The cause for this waste is unrestricted competition. The operator, driven to economize, cannot expend the large amount of money needed to assure a more thorough extraction of his coal.

Why Mining Competition Is So Severe

The ruinous competition in the production of coal from which the coal business has suffered in practically all its branches during recent years has made a low cost of production necessary. This has been the cause of much of the waste of our coal resources. The coal business is different from almost any other because the natural mine conditions and the cost of opening and equipping the mines are not always equal. As a result the cost of production is not evenly distributed.

Thus we may have a desirable thickness of coal in one mine and weak roof; or both may be satisfactory, but the mine may have a soft bottom and be subject to squeezes and creeps. In other cases the roof is strong and the bottom hard, but there are impurities, and as a result the coal is not good. On the other hand, the coal may be otherwise satisfactory but too thin for mining. Occasionally, however, we have all the desired advantages—good roof, thick and clean coal, and a hard, level bottom free from water. The result of these varied conditions is that some mines cannot compete with others.

The owners after spending thousands of dollars in opening up, equipping and developing the mine must choose one of three solutions of their difficulties. They can continue, at a loss, to compete with producers who can mine coal cheaply or they can close the mine temporarily and pay out a fixed amount of money each month in keeping up miles of tunnels, etc., or they can close their mine entirely, allowing their property to go to waste. In many instances the last-mentioned policy is the only solution, and it not only results in a large waste of our coal resources but it throws hundreds of men out of employment, causing an unnecessary waste and expense.

If the owner decides to operate at a loss, improvements are kept at a minimum, which practice leads to mine accidents. An operator is apt not to give the employee the protection his hazardous employment demands unless there is a fair return on the investment which he has expended on the mine.

The conditions thus outlined are practically identical with those that existed in the coal fields of Australia until the colliery proprietors were able to effect a combination controlling the wholesale price of coal, and distributing the orders.

Conditions Analogous to Those in Australia

Early in the present century the Maitland coal field was opened and it entered into destructive competition with the other New South Wales field which had been operated for about a century. To meet the situation, which was similar to the condition now existing in Indiana, a combination was effected early in 1906 through two contracts, called the vend and shipping agreements. The first of these was a contract between the colliery owners which provided for the fixing of uniform wholesale prices for all coal taken from the field and for dividing the total output among the members in certain proportions and for limiting the output of various collieries to the allotted proportion.

The shipping agreement, supplementing the vend agreement, was a contract between the shipping companies and the collieries. It made the former the selling agents of the collieries for interstate trade, with exclusive agreements on each side and with certain price-limiting provisions. An attempt was eventually made to break up the combination on the ground that as the contracts in question were clearly in restraint of trade, and so unenforceable at common law, an intention to injure the public must be inferred. The court refused to adopt this position, which was urged by the attorney-general, and it pointed to the recognized economic advantages of certain agreements in restraint of trade, especially those of trade unions.

Consumer Is Interested in Fair Prices

The court in delivering its judgment said:

> It can never be in the interest of the consumers that any article of consumption should cease to be produced and distributed, as it certainly should be unless those engaged in its production or distribution obtain a fair remuneration for the capital expended and the labor employed. There can be no doubt that the vend agreement was intended to preclude competition among its members, and by this means to raise and maintain the price of coal.
>
> Low prices are of advantage to the consuming public and their Lordships will assume that in default of anything to indicate that the prevailing prices were too low to afford the colliery proprietors a reasonable profit, having regard to the capital embarked and the risk involved in their trade, a combination to raise prices would, from the standpoint of the public, require some justification.
>
> In the present case, however, it was proved that the prices prevailing when negotiations for this agreement commenced were disastrously low owing to the "cut-throat" competition which had prevailed for some time. It can never, in their Lordships' opinion, be of real benefit to the consumers of coal that the colliery proprietors should carry on their business at a loss or that any profit they make should depend on the miners' wages being reduced to a minimum.

---

*Deputy inspector, Department of Mines and Mining, State Capitol, Indianapolis, Ind.

> Where these conditions prevail the less remunerative collieries will be closed down, there will be great loss of capital, miners will be thrown out of employment, less coal will be produced, and prices will consequently rise until it becomes possible to reopen the closed collieries or open new seams. The consumers of coal will lose in the long run if the colliery proprietors do not make fair profits or miners do not receive fair wages. To prove an intention to injure the public by raising prices, the intention to charge excessive or unreasonable prices must be apparent.

This decision of the court certainly is one that is applicable to the conditions at hand. No business, and more especially the coal business, which is so hazardous, should be conducted at a loss. In 1910 there were 182 mines in operation in Indiana employing 21,171 persons, whereas at the present time there are only 126 mines working, and these employ on an average 20,518 persons. The conditions of the coal business have become so deplorable that they have repeatedly driven coal-mine operators into bankruptcy, wasted our coal resources, destroyed life and property and rendered idle each year hundreds of mine employees. The situation, at last, has become intolerable.

The coal operators of Indiana, together with those of Illinois, through absolute necessity have at last been forced to seek some relief. Several meetings have been held in Indiana to consider what can be done to alleviate the present deplorable conditions in the coal trade. They deserve to succeed, and will, if they are successful in getting all the facts before the public. The Federal Government, and the state government also, should recognize the evils of overproduction and the dangers of unregulated competition.

Alcohol as a Motor Fuel

By Leonard K. Hirshberg*

In the light of recent fuel conditions throughout the world as a result of the war, alcohol as a marine, automobile and stationary-engine fuel has come into larger consideration than ever. It even makes growing vegetation, potatoes, cereals and other plants aids to the users of the internal-combustion engine.

In the manufacture of alcohol, all of the materials used are obtained by the plants from the air, and nitrogenous things withdrawn from the soil are thus ultimately returned to the ground and the atmosphere as fertilizer. In a word, alcohol is the transformer of energy. It transmits the energy of Old Sol from the plant to the engine and then back again to the soil for the plant.

Vegetation is the human agency of heat, electric power, fuel, and energy in general. If you consider that alcohol comes from plants; that the heat value of the gallon of alcohol is only six-tenths that of an equivalent quantity of gasoline; that the alcohol yields more and better work, it will be seen that a little difference in price is all that is needed to make alcohol the fuel. The war has no doubt brought this about already in Europe.

The efficiency of the alcohol is greater, although its heat value is slightly below that of gasoline.

One bushel of white potatoes yields 5¼ lb. or eight-tenths of 1 gal. of absolute alcohol. One bushel of sweet potatoes yields nearly 7 lb. or over 1 gal. of absolute alcohol. One bushel of corn gives 16.53 lb. or 2½ gal. of absolute alcohol. Rye yields almost the same. In Germany at present corn, rye and potatoes are being utilized successfully to make alcohol fuel for motor boats, warships, motor cars, engines and the like. Potatoes are perhaps more generally used over there. Whereas the average yield in this country is only 45 to 50 bu. to the acre, they average over 400 bushels to the acre in Germany. Germany made nearly 50 million gallons of alcohol for fuel purposes just before the war and she has doubled this since, practically all from her marvelous potato crops.

While alcohol is four times the price of gasoline per gallon, there is little likelihood of troubling farmers and distillers with its prospects. When, however, gasoline soars to 40c. and more, alcohol becomes a triumphant competitor and wins the day.

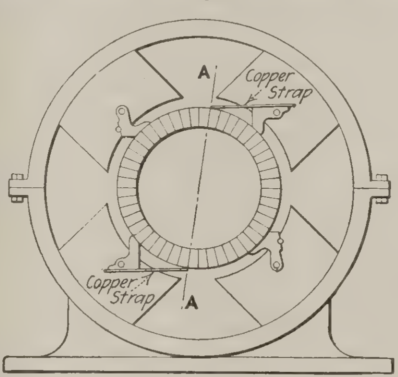
Alcohol, however, is to be made much more cheaply hereafter. It can be made from peat and be sold as low as 5c. per gallon.

One authority estimates that billions of gallons of this 5c. alcohol can be obtained from one small bed of peat in a swampy district of Virginia. At 5c. a gallon for absolute alcohol, you are paying the equivalent of $2 a ton for the best coal on the basis of the best steam-power efficiency.

These peat beds alone will yield enough alcohol to replace as fuel, for at least four years, all the oil and coal now burned to drive heat engines in the United States. It is the belief of some engineers that before many years have passed a practical method will be developed whereby alcohol will be obtained from vegetation.

How To Revive a Dynamo

It sometimes happens in a power station when starting up a dynamo that it will not build up its voltage, and shifting the brushes to the limit of the slot in the holder yoke does not bring the desired result. When this is the case, using a current from an outside source, either from a generator or battery, will remedy the trouble. Current must be made to flow around the fields. It is most important, however, that this current flow should be in the same direction as that of the current of the armature. If this is wrong in the first trial, it is only necessary to reverse the connection.



OUTLINE OF DYNAMO, SHOWING APPLICATION OF COPPER STRIPS

Should no outside source of current be at hand and the generator must be started in a hurry, it may be well to strike the metal of the fields with a hammer in a gentle way. Dynamos have been started to generating by this means. But should this also prove unsuccessful, the next expedient is to get two pieces of thin, flat copper about ¼ in. wide and have a man hold these strips across the brush-holder studs, allowing the points to touch the commutator just past the line *AA* in the accompanying sketch. It will be found when this is done that the machine will start to build up and increase in voltage very rapidly.

---

*Baltimore, Md.

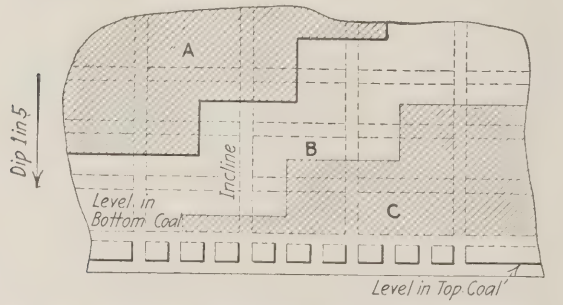
Working Seams That Occur Close Together

SYNOPSIS—Numerous problems arise in connection with the development of coal beds that occur close together. Several methods of mining under difficulties of this kind are here described in detail.

The following is a description of a method of working coal seams as practiced at Patna, Ayrshire, Scotland, in a colliery of the Dalmellington Iron Co.

The coals are sought on the threefold longwall principle. The slate between the seams is found to vary widely in thickness, and this necessitates various modifications of the system of working. When the section is in proper shape for a successful threefold working, the parting between the bottom and middle and middle and top coals is about 3 ft. thick. In each case this gives sufficient débris to build the walls, but not sufficient to prevent the strata from settling down gradually.

The main levels are driven either in the top or bottom coals, preferably the bottom, as this seam has a good roof and floor. The branch roads, 36 ft. apart and 12 ft. wide, are driven direct to the rise of the seam, the gradient being 1 in 5, and are cut off at 300-ft. intervals by cross-levels driven from the heading. If these branch roads have been packed and built with a 3-ft. brushing, in 12 months' time the packwalls will be crushed into the roadway, and the gob will allow the mid coal to settle down in the original position of the bottom coal.

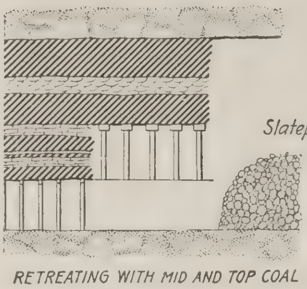


PLAN SHOWING METHOD OF DEVELOPMENT

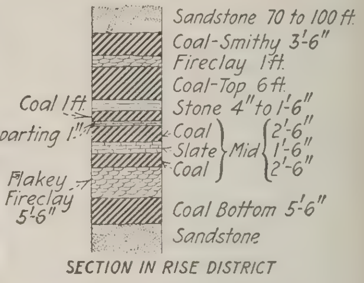
Working the Middle Coal

The mid coal is now ready to be worked. It is the softest of the three, and if allowed to stand for a longer period than the time mentioned, it is likely to be crushed to a powdered state. The same roads are again followed, as was the case in the first working, and these are ripped up to the bottom of the top coal. When the cross-level is reached, a stoop (pillar) is left for its protection; then the top coal is opened out and brought home. Pillars of old timber or rock are built behind to allow the roof of the waste to come down slowly. During the first and second working, the coal forming the roof often creeps down so quickly that it may have to be ripped to allow height for the mine cars, but as it is coal, no extra expense is incurred.

Many years ago these beds in a neighboring mine gave a great deal of trouble from spontaneous combustion and had to be abandoned. To guard against this danger, the levels in the colliery here referred to are driven in the low coal 9 ft. wide, with large pillars on each side, and advantage is taken of strips of whin and "burnt" coal running parallel to the dip and rise to form natural barriers, so as to divide the workings into panels that may be isolated in case of fire.



SKETCH SHOWING RETREATING METHOD OF MINING

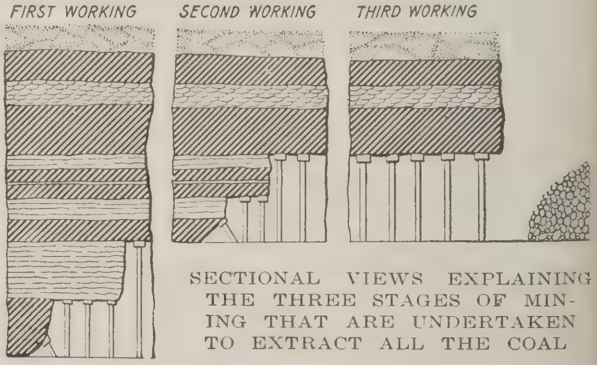


SECTION THROUGH THE STRATA OF COAL AND ROCK

As an example of possible changes in the foregoing method of working, due to any alteration of the section, the method of working in an adjacent district may be of interest.

Another Method of Working

In the first working, the fireclay or brushing over the bottom coal packed the walls solid, with the result that the strata came down very little. As it would not have been judicious to have left the upper coal under pressure for a longer period waiting for the strata to come down, the mid coal was opened out at the bottom of the old roads on a bench 8 ft. above the rail level. The removal of this mid coal to its full height meant a working over 12 ft. high on the road-head, and as the slate in the center of the coal was 12 in. in thickness, it was decided to work the bottom portion of the coal and build the packs with the 18 in. of slate, and then to bring back the upper portion of the mid coal with the top coal.



SECTIONAL VIEWS EXPLAINING THE THREE STAGES OF MINING THAT ARE UNDERTAKEN TO EXTRACT ALL THE COAL

A few places were tried in this way, but the method was not successful, as the packwalls on the top of the bench, and the bench itself, were inclined to slide over into the roadway. This was exceedingly dangerous and caved the road behind the men at the face.

Another district with a somewhat similar section was opened out, and another system adopted with more success.

After the first working had reached a large upthrow fault, the mid coal was opened out on the top of the bottom coal brushing and taken out 20 or 30 ft. down the road. The back props were then drawn to within 6 or 8 ft. of the face, which permitted the top and smithy coal to fall from the rock. After this fall had taken place, the men would climb up onto the top of it and sound the rock, which was very hard and strong. They would then take down any loose coal hanging on the face (ladders and long-handled picks being provided for this purpose), after which they would proceed to load the fallen coal.

A face 150 ft. long could be brought back in this way with little or no loss of coal. When the coal was all cleared away, the height of the working would measure about 30 ft. to the rock roof. This was a twofold working.

Hauling the Coal

The cars being of small capacity were easily manipulated. The loads were generally brought from the coal face by the men. The gradient being 1 in 5, it was quite impossible for the miners to push their empty cars to the face or let the loads down by hand. The method employed to overcome this trouble was a plan often used in mines where the gradient is steep: A good-sized prop (6 to 8 in. diameter) was placed at the face, a hole was then bored through the prop and a small chain-wheel attached. Next the miner passed a 3/8-in. chain around the wheel, one end being attached to the loaded car and the other end to the empty car. The loaded car going downhill hauls up the empty car. If a single line of rail is used, it becomes necessary to provide a place to throw the empty car over on its side, to allow the loaded car to pass. Where the roadways are wide, there is no difficulty experienced in doing this.

In some mines there are in use iron carriages which balance the loaded car. The rails used for these are sometimes lighter than the car rails. The loaded car is thus let down to a lower level, where a sidetrack is provided, which usually is the end of the main haulage.

One of the men pushes the loaded car after it leaves the chain. The other man takes the empty car to the face. The man who takes the loaded car to the sidetrack is called the "drawer." This system gives entire satisfaction and has been in use for a number of years in this and other collieries.

⁂

Extracts from a Superintendent's Diary

There is only one man who comes to our camp in an official capacity whose decisions I dare not question and whose recommendations must be carried out to the letter, whether they have my approval or not. He is the boiler inspector in the employ of the insurance company that carries the liability insurance on our boilers.

Were he to condemn one-half of our boilers and insist that we put them out of commission immediately and keep them out until certain repairs could be made, I would follow his instructions implicitly even though it might require a shutdown of all our operations for a week. Personally I might question the necessity of such extreme action, but if I could not outtalk him and he should insist on putting down his recommendations in writing, no earthly power could induce me to ignore his instructions.

He realizes this as well as I do, and as a result he keeps in mind a factor of safety of about 25 (figuratively speaking, of course) in passing on our boilers, and thereby lightens his labors considerably and relieves himself of practically all responsibility. It usually takes me about two days, following one of his inspections, to get my dignity adjusted.

To-day, however, I had a new experience, and as a result I have about decided that Beelzebub had no part in giving boiler inspectors their power.

An inspector spent last night finishing up his regular monthly inspection of our boiler plant, and early this morning he dropped in for a few moments to notify us as to what he intends to require of us.

Shortly after he had gone a disciple of "syndicalism" came into my office in search of work.

Probably if I had known that the applicant for work considered himself a "syndicalist" I should have dismissed him promptly, but as I had no reason to suspect his philosophy of life and as he made a favorable appearance, I granted him the customary interview, inquiring into his experience to see if we might use him in our organization.

I soon found, however, that he did not take kindly to personal questions, so I told him that we had nothing to offer him.

He was evidently not pleased with my manner toward him, so he opened up and expressed himself rather candidly before leaving.

During the course of his remarks he used this quotation: "Power will intoxicate the best hearts, as wine the strongest heads. No man is wise enough, nor good enough, to be trusted with unlimited power."

That thought recalled the boiler inspector to my mind at once, and the more I pondered over it the more I marveled at its truthfulness.

But the "syndicalist" was not interested in boiler inspectors; he had coal-mine superintendents in mind, and he insisted on telling me how small some of them appeared when judged by the quotation.

He made me realize all right that some of the men in my employ have justification for the same feeling toward me that I entertain for the boiler inspector, and he brought it home to me with a bang.

I was not foolish enough to let the agitator know that he had hit a bullseye or even that he had made an impression, but it will be many a long day before I recover entirely from the shock which he administered to my viewpoint.

And I know that in future whenever I feel like saying things to or about the boiler inspector I will first look about to see if my subordinates have reason to complain about the manifestations of my unlimited power.

⁂

An Important Advantage of Electric Winding, S. A. Simon has informed the Scottish Mining Electrical Engineers, is the steady and even torque produced by the motor, whereby whipping of the rope as caused by the pulsating action of a steam engine is prevented. As a consequence, the rope is less severely stressed, and it is possible to predetermine the stress more accurately, so that higher rates of acceleration and retardation are possible and higher speeds of winding can safely be employed. This applies more particularly when men are hoisted. In Germany, previously when men were being raised, a maximum speed of about 30 ft. per sec. was prescribed. Since the introduction of electric winding, double this speed is permitted, with electrically driven hoists fitted with the usual safety devices.

Use of Air Drilling Machines in Coal Mines

SYNOPSIS—Power-driven drills are now being used for all kinds of drilling work in coal mines from putting in holes for trolley-wire hangers to drilling shotholes in coal, clay and slate and making long holes for prospecting purposes.

The makers of power-driven drills have been many years in fitting them for use in coal mines. The mechanical drill was first invented to work where speed, not cost, was the main consideration; namely, at the Mont Cenis tunnel between Switzerland and Italy. If the work on that tunnel had not been hurried, the interest and running costs would have been prohibitive, and something was wanted which would drill hard rock and drill it quickly. It mattered little if it was a heavy machine for a number of holes had to be drilled at one time and on one line of entry.

Drilling Shotholes in Coal or Slate

But the coal problem is different. The coal can be drilled quite readily by hand, and only a few holes are necessary to shoot it down. So the main need is for an easily transportable drill not needing a truck to move it, which can be handled without a scaffold, a car or a drilling column, and capable of being operated in the narrowest of places or with the operator perched on a ladder. It must be available without any previous preparation for its use, except the connection with a pipe line such as is always in place when an ordinary coal puncher is in use.

And that kind of a drill has been long in appearing. Now that it has come it is quite likely to displace the old hand-drilling outfit, except perhaps where it is possible to sink holes with a breast auger. There is much trouble in drilling a hole in hard or sulphury coal, in slate or in clay. The preliminary sinking of a hole in floor and roof, the bringing up of a heavy extensible drilling post, placing it in position and then drilling, often in cramped quarters, takes much time and involves much labor. The work is by no means simple, even though it is done by hand.

With a 40-lb. Jackhamer drill there are no delays except to bring up the drill, connect it to the airline and hold it to the work. In even sulphury coal it will advance a foot in a minute, and so save time and the hardest kind of labor. The frequent trips to the blacksmith's shop, the broken drills, the uncertainties in coal production, the general discontent which prevails in a camp with hard coal, are all avoided. So little is known about the time expended on the various elements of coal mining that most operators are unable to tell what the items of drilling cost. Drilling certainly is no negligible item anywhere, and in some coals it is one of the most distressing.

T. B. Young states that when he was mine superintendent at Aladdin, Armstrong County, Penn., he found he could drill a 4-ft. hole with a Jackhamer quicker than he could set up a post drill to do the work. One man with a Jackhamer would do more than two men with a post drill.

Those who are using the Jackhamer find, moreover, that it can be used everywhere. It has been found valuable in the sinking of holes for trolley hangers, for which it is not too heavy. But if it is light enough for coal it is nevertheless heavy enough for drilling limestone. One man in lifting bottom in this material averaged 40 ft. per shift and drilled 1½-in. holes. This was at the mine of S. M. Hamilton & Co., at Wellscreek, Penn. Another man working for the Rockhill Iron & Coal Co. says he can bore a 6-ft. hole in solid limestone in 22 min. and can drill a hole of that depth without cleaning.

A Prospect Hole in Rock 30 Ft. Deep

In December of 1914, at the Staunton colliery of the Harleigh-Brookwood Coal Co., near Mahanoy Plane, a tunnel was driven by the Portland Contracting Co., and the contractors desired to know how near they were to some old works and if they contained water. M. C. Reed, in describing the method of exploration, says:

ALL THERE IS TO IT

> Having no prospecting drill we decided to drive the hole with a Jackhamer, using four pieces of steel, 3, 6, 9 and 12 ft. long sharpened to a 2-in. gage. After drilling 12 ft. with this set of steels we welded a bit into a 2-ft. length of 1-in. pipe and a shank into another pipe. Then with extra heavy couplings we connected these to a 10-ft. length of the same size of pipe and drilled the additional 2 ft. without finding the old workings.
>
> Being so successful with this innovation we had the bit resharpened and added another 2-ft. section of pipe and proceeded to drill again. We continued in this maner, resharpening the bit and adding 2-ft. sections of pipe until we found the old workings at a distance of 30 ft.
>
> The hole was drilled through a hard slate formation on about a 6 deg. pitch, and the Jackhamer rotated the steel perfectly until the hole was finished. It would be interesting to know how far we could have drilled, because the way the outfit was working when the hole was finished makes us feel we could have gone several feet further. However the size of the hole would soon have stopped us because of the size of the extra-heavy couplings. The diameter of our bit was about 1⅝ in. when the hole was finished.

Mr. Reed says he is drilling 12-ft. holes every day with the Jackhamer drill and is experiencing no difficulty in so doing. A prospecting drill costing about $750 would have done the work, it is true, but the flexibility of the Jackhamer is most convincingly proved by this work, for which, of course, it was never projected.

Tunnels Driven Only 30-In. Square Section

To show the varied work to which the Jackhamer is adapted that done at Pax, W. Va., and cited by John Lindley, of the New River & Pocahontas Consolidated Coal Co., may be quoted:

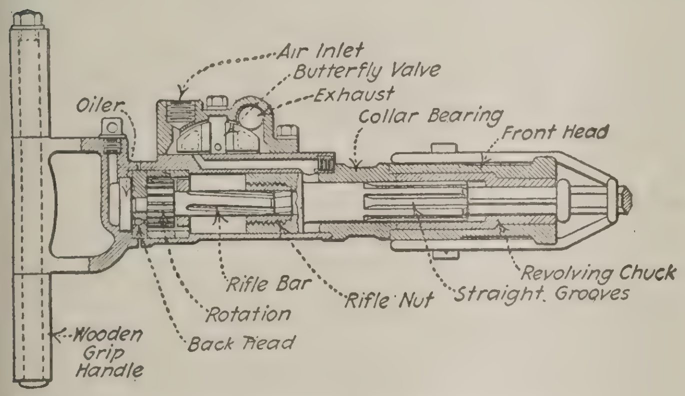
> We have driven 11,460 ft. of narrow entry, including 7868 ft. of 10-ft. entry, 3292 ft. of 12-ft. entry and 300 ft. of 22-ft.

entry. The slate in these roadways ran from 1 ft. to 18 ft. in thickness and averaged about 6 ft. Four overcasts were constructed, three of which have a cross-sectional area of 76 sq.ft. and the fourth of 104 sq.ft.

Two waterway tunnels were driven, each 50 ft. long and 2½ ft. square. Such a small opening could not have been driven with any other drill and is quite unusual, but we desired to drive a tunnel of minimum dimensions. A ditch was constructed 125 ft. long, 18 in. wide and 3 ft. deep and another 50 ft. long and 18. in. deep, also with the help of the Jackhamer. The excavation in solid rock of a pump room 9x12x18 ft. has just been completed with the aid of the same handy tool.

Our shaft is concrete-lined and very wet. We desired to make water rings in the solid concrete to drain the water to the sump by means of pipes. To do this we tapped our air line at the surface and swung a hose line down the shaft. We then took a Jackhamer drill, and working from the cage, drilled holes 4 in. deep in the sides of the walls, sloping downward and as near together as possible. Afterward we smoothed and pointed the work with hand drill and hammer so as to make a continuous ring trough round the shaft.

In this manner we constructed three rings which carry the water to one end of the shaft, from whence it is piped to a reservoir (also made by a Jackhamer) and pumped to another reservoir on the top of the hill. The water being pure it is used for the supply of the camp. Our best drilling with these Jackhamers was one 6-ft. hole in slate in 8 min. and six 6-ft. holes in coal in 24 min. The driller in making these results did not know he was being timed. He said he had drilled a slate hole 6 ft. deep in 5 min. when he was putting forth his best efforts. We are averaging 200 ft. of drilling per shift with two Jackhamers and four men. These men move from place to place and lay their own pipe lines.



THE JACKHAMER IN CROSS-SECTION

It is impossible to tell all the different positions and places in which we have used Jackhamer drills. We worked from small trestles of 2x4-in. lumber built up 6 to 15 ft. above the ground, supports which would have been wholly inadequate for the columns of other makes of drills. Since we started using the drills, the cost of upkeep has been comparatively small, not over $100 including a new set of bits, six extra 12-in. bits and one extra 36-in. bit.

One Hand-Drilled Hole Costs as Much as 43 by Machine

At the Edgewater Mine, Ensley, Ala., the compressor recently broke down and the Jackhamer was put out of commission in consequence. Two men were put to drill a hole by hammer and steel. In three hours it was completed. The combined wages of the men was 50c. per hour, so the hole cost $1.50. As soon as the compressor was running the same amount of work was done in 7 min. with a wage charge of 30c. per hour. So the hole as made by the Jackhamer cost only 3½c. That same Jackhamer ran two years without a cent of repairs.

At a mine in central West Virginia a Jackhamer was used to drive through a "want" where the coal was replaced by white sandstone of an extremely flinty character. The heading measured 6x20 ft. The cost of driving the roadway without the drill was about $40 per yard; with it, it was driven for $22.

At the Black Joe mine in Kentucky, the trolley-wire hanger holes were put in by two men with hammer and steel. In a whole day they put in 9 or 10 holes from 4 to 6 in. deep. One man with the Jackhamer can drill 9 or 10 holes in 10 or 15 min. At the same place a coal hole 5 ft. deep has been driven in 2 min.

R. G. Johnson, of the Dravo Contracting Co., states that largely by the help of three Jackhamers he sunk a 350-ft. shaft and lined it with concrete and put in a steel ladderway. His repair bill on the hammers was only $12.42. In establishing this record during the month of May the shaft was sunk 126 ft. and lined completely.

These drills are made by the Ingersoll-Rand Co., of 11 Broadway, New York City.

*

Sweden Buys German Coke

The importation of coke from Germany, says *Commerce Reports,* during the last few months has been exceptionally good. During May, 1915, 16 ships arrived in Stockholm from German harbors with about 30,000 tons of coke. This great coke import is of course caused by the high prices of coal in England and the freights from there.

Many steamers, especially the smaller ones, as well as the state and private railways, are now using coke—either alone or mixed with coal or wood—as fuel, apparently with good results, as the import of coke continually increases.

*

Coal Imported at Limon

The approximate annual amount of coal used in the Port Limon district of Costa Rica is about 50,000 tons, says Consul Chester Donaldson in *Commerce Reports,* practically all being imported from the United States. This coal usually comes in cargoes of about 4000 tons.

The two wharves at Port Limon afford facilities for unloading or loading four to five vessels of 5000 tons register at the same time. The depth of water is 20 to 28 ft. Each ship can discharge 500 tons daily.

The port charges are as follows: Pilotage (not necessary), $14; tonnage, ships 2000 tons or under, $23.26 ($1 for each additional 100 tons, maximum $30); Costa Rican bill of health, $2.79; wharfage, per day, $30; springs, per day, $7 each; buoys, per day, $4.50 each; derricks, per day, $4.50 each.

The only coal imported at the present time is a West Virginia coal imported by the Northern Railway Co.

*

Higher Wages for Welsh Coal Miners

By decision of an official arbitrator, says Consul Lorin A. Lathrop of Cardiff, Wales, in *Commerce Reports,* wages of coal miners in the South Wales coal fields have been advanced. Miners asked 12½ per cent. advance on actual earnings. Owners offered 10 per cent. on standard wages. The arbitrator awarded 17½ per cent. on standard, equal to 11 per cent. on earnings. Hence miners received nearly what they asked. The minimum wage of a skilled collier will henceforth be $11.87 per week. Actual earnings may be taken at double this sum.

The Psychology of Strikes at Coal Mines

By Josiah Keely*

SYNOPSIS—All strikes do not arise from grievances, or otherwise the employees at mines where there is the greatest cause for complaint would strike first. The men with the lowest scale in a district often are the least disposed to strike. The fear of being outlawed as a "scab" binds the contented to the discontented more firmly than their common grievance when they have one.

Perhaps this title may prove more academic than is intended, but it is chosen advisedly in discussing the subject, "Why are Strikes at Coal Mines of Such Frequent Occurrence?" We may well admit that there is an undue tendency to carry all difficult problems into the realm of psychology in order to dodge the burden of proof or to befog something that does not offer an easy solution. However, even after making such an admission we must confess that we do have abundant evidence that a man's attitude toward his job is not always based on material conditions or on any deep and systematic reasoning.

In certain mines we have what we call "inherited" rates, or wages, and the tradition in favor of these is so strong that even in labor-union agreements the old rate is allowed to stand. It is not questioned, because it has been a custom, a precedent. Nearly always some of the "oldest inhabitants" can tell you how that rate was started.

We all know that a "wet rate," though established for a heading producing water, will lose us a miner if the entry becomes dry and the old rate is put in force. Somehow the entryman feels as if he had been cheated if he is not paid for water which no longer annoys him. Again, we have a breakthrough that encounters a fault. The miner quits and no one will take his place. However, start someone on the other side and he may drive through; all we need to do is to get a "running start" at it.

Strikes Are Instituted Both in Mines Having Liberal and Illiberal Conditions

In a certain district, where payment was made by the car, it was many years before the cars at all mines were brought to a standard size. All the men in that region could tell you just which mines had the larger cars, yet all accepted without complaint the working conditions in force at each mine, because everybody else assented to them. All changes except a flat increase in rate are looked upon with disfavor.

Similarly two mines, working side by side and paying their men by the carload, may demand that the car be topped to a different level without a complaint being made by those miners who have always been required to build their cars to a greater height above the side boards. If it has been a custom to load in a certain way, the merits of the system are not subjected to criticism.

It is notorious how workmen will follow a recognized practice. Thousands of dollars have been lost in attempting to install new devices and new types of machinery around mines, not because there was anything wrong with the improvement, but because it entailed a change of custom or habit. When steel ties are well established, the men will have nothing else. Where wood ties are in use, some system of compulsion must be employed if steel ties are to be introduced. Nor is this a reflection only on the intelligence of the average miner, for this same "conservatism" often extends to the manager himself.

Now if we had not invoked "psychology" to help us out with this problem, the casual reasoner might at this point argue that these citations only prove that the miner is a contented being and disposed to endure much injustice rather than complain of his lot, but fortunately, or unfortunately, depending on your point of view, the man who uses little reason in one case, seems just as incapable of making reasonable demands in another. In other words, prejudices that have not been reasoned in, cannot be reasoned out. When once he has awakened to the new idea of getting more, or working less, no definite limits suggest themselves. This is the phenomenon which the average operator hastily sums up by saying of the mine workers, "They don't know what they want."

It would make an interesting analysis to tabulate how a man acts when alone, how he acts when with a companion, when with two, with three, or with a crowd. It is curious how our thoughts and actions are reflections of what we think is expected of us and how when we leave the conventions accepted as the proper order we lose the proportion of things. Everyone of us is acting for an audience, and the typical "bad actor" is a clear evidence that part of his audience is bad.

Much of the Trouble Is Not Spontaneous, but Hatched

In labor troubles there is much playing to an audience—the operators to other operators and the men to other men. People have always fought as strongly for a sentiment as for material advantage. In the mead halls of the Anglo-Saxons our ancestors made their boasts, and woe to the reputation of him who could not perform his oath.

It has pleased some of the contributors to *Coal Age* to represent that the labor troubles are the result of a yearning after better conditions; and the houses, the commissaries and the systems of measure have been dragged into the discussion. Also, the right to form labor unions has been presented for consideration. Of course strikes will not cease when operators oppose confederation, for though we have some strikes without unions, we have more with them. And the unions are not so harmless that the operators are wrong in opposing them, for the conduct of these much-vaunted associations ranges all the way from organizing for mutual improvement to engaging in Black Hand practices.

Not forgetting that we are all actors, the union local furnishes the best opportunity for an audience and the actions of each man may there be reviewed. Strikes occur in unorganized as well as in union fields, but this is just a paradoxical way of putting the statement, for there can be no strike without some kind of organization. You may term the confederation a union or not, as you please, but in any case a few will be striking for some supposed gain or grievance while the rest will be acting and merely bidding for the approval of neighbors and neighbors' sons and daughters.

---

*General manager, Cabin Creek Consolidated Coal Co., Kayford, W. Va.

I do not know which was invented first, the word "strike" or the word "scab," but the whole psychology of strikes revolves around that expressive epithet, the deepest curse of the striker. It can be pronounced with the same hiss as "scathe," "scald," "scorch," and it burns deep.

Discontent Is a Matter of Education

The "sturdy son of the soil" first had to be educated to the proposition that he was downtrodden. This was accomplished by politics; but political appeals to the people are not new. The wonderful development of transportation and the long-distance news service have served to multiply the influence of a single restless spirit a thousand-fold. The news that the laborer must get his "rights" has flown like a pestilence to the ends of the earth, and the echo has reverberated until we cannot now distinguish sound from echo. It is in the air.

One must be an optimist indeed to predict any speedy adjustment to the conditions which make strikes possible. There is a nice distinction between a strike and a rebellion, but there is also an analogy. The element of oppression is supposed to exist in both, but a successful strike does not attain to the dignity of a revolution. There was a time when much was said about contentment with one's station in life, but there seems to be rebellion against having such a station. No one listens with complacency to the statement that stars differ in magnitude and that angels differ in glory. The wealthy man's automobile is a red rag, and his brownstone front engenders the cry, "On to the Bastile."

At a recent investigation into a strike, a senator from New Jersey asked a Catholic bishop from West Virginia what he thought brought about the feeling of the miners against the operators, and he answered gravely that "the fine homes on Front Street in Charleston had a lot to do with it."

We have an army of wealthy people in this country who, having "got theirs," attempt to do penance for their questionable methods of getting it by administering first aid to labor. It satisfies the human craving for popular applause without selling all their goods to give to the poor. They are the Industrial Loafers of the World.

It is necessary to touch all these seemingly irrelevant matters in order to establish a psychology for strikes, and it will not be out of place to mention that we still have quite a few operators who, having convinced themselves that miners are unreasonable, work on the theory that it is just as easy to "get by" with a "raw deal" as to work for coöperation.

Strikes Violating Contracts Are Inexplicable

Before going any further it might be well here to give some concrete examples of strikes. Of course there are annual, biennial and triennial strikes to get contracts. We expect and prepare for them; but I take it that the strikes that are the most frequent and annoying are the "hold ups" when the miners throw down their tools after they have agreed that they will not strike. At a certain mine working under an agreement to take up all matters by arbitration and to suspend work under no circumstances, a young man was questioned by the superintendent about a pump that he had maliciously broken.

The employee added to the offense by becoming impudent to the superintendent and was discharged. Now the contract specifically stated that the right of discharge should not be questioned. The matter was taken up by the local union and a strike called. The management, hoping to establish cordial relations with the men, waived the company's rights in the matter and reinstated the young man conditionally. Another strike was soon after narrowly averted because the pump was not also as speedily reinstated.

Another mine was losing about 300 tons per month at the scales. The cars were reweighed in the presence of a committee, and it was found that the tare weight had to be reduced 70 lb. and that the company had been losing just that much on every car weighed. As the weighman was not eligible to the union, was supposed to look after the company's interests in weighing, and had permitted the loss, he was replaced. The miners struck and would neither appoint a checkweighman nor allow the man whom the company appointed to weigh their cars.

Another mine had a bad condition which could not be covered by the scale. This section was being worked by contract after being refused at the scale price. The miners struck to have the work operated under the scale. Knowing that the real trouble was the objection to contracting, the management gave the contractor another job and offered the contract to the president and secretary of the local union. They accepted and there was no more "local" at that place.

At a mine striving for a better output and not showing any improvement, it was found that the motormen had virtually agreed to haul just so many trips per day. Instead of discharging them, they were given the benefit of the doubt and changed to other work. A strike followed, and an adjustment was made only when a counter-charge of dishonest checking-off by the checkweighman was dropped. There was a suspicion that this charge had been brought in order to use it as a compromise, but that is not a matter of psychology.

I regret that I cannot cite some example of a strike to remedy something "real raw" done by the company, for I suppose there are examples. Oh yes, I do recall one: A company was furnishing explosives to its miners and decided that it was a bad practice, which it was. The company ordered that it be discontinued and a new price be placed on the car, and the additional price was not enough by about one cent to cover the cost of explosives.

How "Bushwhacking" Is Introduced to Nurture the Union

Now there is a phase of strikes which, if noted, would swell the number to unknown proportions. It is what is known as "bushwhacking." After a bloody attempt to organize a new field on the closed-shop basis, the U. M. W. of A. made a contract by which the union was recognized, but under which nonunion men might still work. By a system of stealing and breaking up tools and throwing rocks against houses at night, the nonunion men were induced either to leave the region or enter the union.

The agreement also provided rates for future work with allowances for "inherited" rates. When a nearby mine had some pillars to start the men began bushwhacking for the inherited rate of another mine, instead of the agreed regular rate. No one could be found to work the pillars. Finally work got so scarce and the pillars were so desirable that some bolder spirits undertook to work them. In a few days they found their needles twisted around the posts, their axes ruined and the handles hacked out of their shovels.

These instances can be multiplied and are of almost daily occurrence, but we started to build the psychology of strikes around the word "scab." This word stands for the mental attitude back of all strikes. A traitor is bad enough, but a scab is a denegrate traitor and worthy of a thousand deaths. The scab always leaves a cicatrix. Once a scab always a scab. To the miner this stigma carries all the terrors of excommunication. To avoid any possible danger of this curse, the average miner will not only strike, but do violence to convince the doubters.

It is not necessary to drag into the subject the stock-in-trade inconveniences in a coal camp—the living conditions. A group of camps often includes some where living conditions are better than others, yet the striking and bushwhacking does not follow the squalid conditions. As a matter of fact, the agitator usually succeeds in getting the best house and the best place in the mine.

It is not necessary to be a traitor to be a scab. Strikes occur with frequency because it is so easy for a man to be denounced as if he were one. In some camps he can earn that cheerful title from any one of a hundred acts, ranging from speaking pleasantly to the boss to taking a man's job when he is discharged. But there is one deadline beyond which no miner can pass and escape excommunication—that is, to work when the strike is called. That is the real reason why a strike is so easily started. It requires no further advertising than the word of two or three leaders. It is true that there is often much mummery of voting, etc., but the real deterrent is the cold fear of the word "scab." The miner's life is not a full life; each plays to his limited audience, and the hiss of the audience means social death.

NEVERTHELESS IT IS NOT WELL TO BE REACTIONARY

Of course we must continue the good work of bettering working conditions and the striving for a more cordial relation between company and men and the other refinements of operating, but these great waves of popular discontent come on like a squeeze in a mine, and for the same cause—things have been worked on the wrong system until the movement gets started.

There is probably little real injustice done the miner by the operator today. In fact, labor seems to be getting more out of the investment than capital is, yet perhaps in years past, during the rapid development of coal, some inequalities existed that furnished seed for the agitator and the politician. The demand for labor made it easy cultivating, and we will be fortunate if it does not prove a crop of dragon's teeth.

The miner needs our sympathy, for where he may have been whipped with the whips of the operator, he is now chastised with the scorpions of a newer and greater bondage. The order of society is reversed, and instead of the sacrifice of the few to the comforts of the many, the miners are attempting to get revenge for supposed or real individual grievances by making the majority of their number suffer from strikes. Until they confine themselves to working for the cause instead of using the strike as a weapon to thwart mine discipline in individual cases, it seems likely that the frequency of petty strikes cannot be avoided.

There is too much evidence that they are trying to abolish penalties. The attitude is that no one shall be held accountable for his acts save to the miners themselves, and the only penalties they seem willing to exact are those for "scabbing." It is too artificial to be a stable condition. The situation will have to get better or grow worse.

⁂

New Coal-Washing Plant

Plans for a new coal-washing plant to be erected on the campus of the University of Washington have been drawn up and submitted to the board of regents by Dean Milnor Roberts of the college of mines. Besides demonstrating coal-washing methods and machinery, the equipment and laboratory will be suitable for making carload tests for the coal operators of the state. Washing is one of the big problems of the coal industry in Washington, which business at present yields $8,500,000, leading all other mineral products of the state.

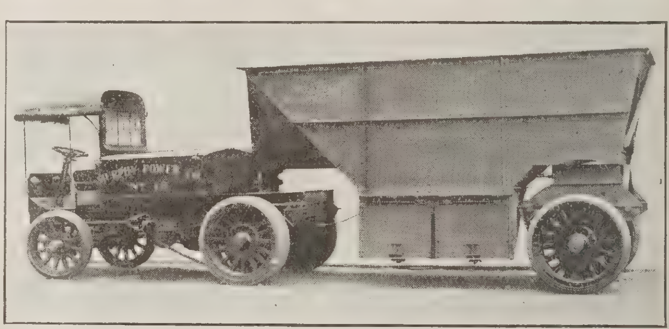
Some of the coals of Alaska also will be washed to prepare them for market or as a preliminary operation to coking. All other tests on coals, such as analyses, calorimeter tests and steam-boiler tests on carload lots, can be made with equipment now used in the college of mines.

⁂

An Electric Tractor and Trailer for Handling Coal

By Frank C. Perkins

The accompanying illustration shows a large electric tractor and trailer, designed at Detroit, Mich., for the purpose of transporting fuel from coal yards to an electric-power plant. It may be stated that this trailer is capable of carrying 12 tons of coal. It is loaded in the coal yards from a hopper, so that the time for loading and unloading is about 8 min. One round trip is made hourly, and two or three carloads can be handled per day. The labor for transferring this coal is reduced to a minimum as but one man is necessary for all the work.



THE NEW DETROIT ELECTRIC TRAILER

It is of interest to note that the tractor has a 100-in. wheelbase and is of standard truck construction except that the batteries are carried above instead of being underslung. This makes them easily accessible, and also affords the proper weight over the traction wheels. The tractor is fitted with 60 cells of Edison battery and has plenty of capacity for this work.

It is held by the owners that by using this car there has been effected a saving of from 12c. to 15c. per ton over the horse-drawn method previously used. They figure the operating cost, and include interest on the investment, depreciation, mechanical and electrical upkeep, body repairs and paint, fire insurance and taxes, driver's wages, current for charging and garage expense.

There is no doubt that the electric truck can be used to great advantage and with high economy, the batteries being charged during the low-load periods of the day.

Wasteful Coke Production

While Germany is carefully conserving her resources by coking her fuel output in byproduct ovens to save the valuable tar, ammonia, gas and benzol, the United States is literally throwing away these useful products to the value of millions of dollars annually by the continued use of the wasteful beehive oven.

In 1914 the total output of coke in the United States, according to the Geological Survey, was 34,555,914 short tons, valued at $88,334,217. Of this 23,335,971 tons was made in beehive ovens, with an almost total loss of the byproducts, and 11,219,943 short tons was produced in byproduct ovens, with a recovery of over $17,500,000 worth of byproducts, or approximately $1.55 for each ton of coke. As there were over 23,000,000 tons of beehive coke made in 1914, and as the yield of coal in coke is less in beehive ovens than in byproduct ovens, the loss of byproducts from coal made into coke in the beehive ovens in 1914 was not less than $40,000,000. The slump in copper and other base metal smelting following the declaration of war in August, 1914, was directly responsible for a marked decrease in the coke production in the Rocky Mountain States.

Compared with 1913 the decrease in coke output was 11,743,616 tons, or 25 per cent. in quantity, and $40,588,056, or 31.5 per cent. in value. The beehive and byproduct coke did not suffer equally in the decrease, the former falling off 10,248,859 tons, or 30.5 per cent. in quantity, and $30,030,371, or 37 per cent. in value, as compared with a decrease in byproduct coke of 1,494,757 tons, or 11.8 per cent. in quantity, and $10,577,685, or 22 per cent. in value.

Three states, Kentucky, Ohio and Washington, showed increases. These increases were all due to the operation of byproduct plants, the building of which was begun in 1912 and 1913. The principal decreases were: Pennsylvania, 8,495,051 tons; West Virginia, 1,044,790 tons; Virginia, 522,619 tons; Indiana, 450,373 tons; Illinois, 434,385 tons, and New York, 301,116 tons.

At the end of 1914 there were 99,755 ovens in the United States, of which 5809 were byproduct ovens and 93,946 were beehive. Of the byproduct ovens 667, or 11.5 per cent., were idle throughout the year, and 44,450, or 47.3 per cent., of the beehive ovens were idle.

At the end of 1914 there were under construction 644 new byproduct ovens and 605 new beehive ovens. During the year 71 byproduct ovens were abandoned, all of which it is expected will be replaced by others of the retort or distillation type, and 3603 beehive ovens were also abandoned.

The following table gives the output in short tons of coke in the United States during 1914, by states:

Alabama	3,084,149	Virginia	780,984
Colorado	666,083	Washington	84,923
Georgia	24,517	West Virginia	1,427,962
Illinois	1,425,168	Maryland	2,222,134
Indiana	2,276,652	Massachusetts	
Kentucky	443,959	Michigan	
New Jersey	255,283	Minnesota	
New Mexico	362,572	Utah	
New York	457,370	Wisconsin	
Ohio	521,638		
Pennsylvania	20,258,393	Total	34,555,914
Tennessee	264,127		

British Regulation of Prices

The newly passed British act limiting prices at the pit mouth, says *Commerce Reports,* is intended to affect domestic supplies, and exports are not within its provisions. Out of the 55,000,000 tons of coal annually produced in the South Wales coal field 37,000,000 tons are shipped abroad in normal times; hence the act will apply to considerably less than half the output. The price of export coal is, however, limited in effect by the license to export required for each cargo. For the six months ending June 30, 1915, the total coal exports from South Wales ports were 10,000,000 tons of 2240 lb. Exports for the first half of 1914 were 14,500,000 tons. This apparent falling off of 50 per cent. is actually much less, for shipments on Admiralty account are not reported.

Nevertheless, refusal of licenses, high freights, shortage of coal and high prices for coal have greatly reduced shipments to Argentina, Brazil, Egypt and neutral European countries.

Ballads of a Coal Miner--V

Written Expressly for Coal Age

The Chance Taker

By Berton Braley

THEY brung up one of the boys today—
  Or what there was left of him—
  A lifeless bundle of broken clay,
A terrible sight an' grim.

I'd seen him when he went down to work,
  A-smilin', an' gay, an' free,
Descendin' into the dusty murk
  With a laugh an' a joke fer me.

An' now he's done, an' his job is through,
  An' his body is lyin' there,
An' he'll look no more on the sky that's blue
  Or walk in the open air.

They told him to timber the roof above,
  But he "guessed it would stay all right,"
An' now he's finished with life, an' love,
  An' pleasure, an' work, an' fight.

He made a gamble with death—an' lost—
  An' life is the bet he paid;
An' wife an' children must bear the cost
  Of the careless game he played.

There's a husband lost an' a father gone,
  An' a good friend dead an' done,
Because of a chance that he *would* take on—
  An' a needless risk he run!

The Labor Situation

SYNOPSIS—The Western Federation of Miners and the United Mine Workers of America will not amalgamate. An improvement in labor conditions may result in Ohio from the general development of the coal business. Strikes have recently been called in other states because of an idle rumor that wages would be lowered and because men formerly employed in a mine now idle are not given employment in one which is still working.

The committee appointed by the United Mine Workers of America at the Indianapolis convention met with another committee appointed by the Western Federation of Miners, and on July 28 decided against amalgamation. The Federation representatives were Dean W. Selfridge, Joseph Gorman and J. B. Rankin; those of the United Mine Workers of America were Frank Farrington, Adam Wilkinson and Robert H. Harlin.

The latter group made a separate pronunciamento supplementing the joint report. This declared that the relations with the Federation were perfectly friendly and that reasons of policy alone prevented union. It further recited in proof of this unquestioned amity that the two labor organizations had for many years exchanged union cards.

Cause for Optimism in Ohio Coal Circles

It is likely that the Ohio situation will soon clear itself, for the marked improvement of business will probably make it possible to reopen many mines now idle and work them at a low margin of profit. This will be regarded as a triumph of the union's contention that the rates are fair, but the trouble will be duplicated all over again as soon as the new scale is signed throughout the rest of the country and business falls back to its normal volume. It is largely the threat of a strike in the spring which is giving tone to the coal trade.

The Public Utilities Commission is expected to be a long time deciding on the rates to be ordered. This body in its previous session on the coal rates cases ended Aug. 6 definitely decided that it would not permit the railroads to offer as a defense the fact that mining conditions and prices of production as between Ohio and outside coal fields are responsible for the present inactivity in the Ohio mines rather than exorbitant freight rates. The railroads were preparing to make this a basis for their defense against a reduction in rates. If it had been admitted, it would have lengthened the sessions, as well as caused a verdict based on improper premises.

In ruling out this evidence Chairman Waltermire declared that the only question before the commission is, "Are freight rates on coal within the state unreasonable and discriminatory?" He declared that side issues would not aid the commission in answering this question.

At the same session the commission permitted Professor Frank A. Ray of the mining-engineer department of the Ohio State University to testify that only 6 per cent. of the available coal supply of Ohio has been mined. He declared that the coal production in the state had steadily increased from 19,500,000 tons in 1900 to 36,000,000 tons in 1913. The amount produced last year was less than 15,000,000, though the same freights were charged by the railroads as in previous years. It was in this manner that an attempt was made to prove that the wage scale was the variable which put Ohio out of the coal market and not the freight rates charged by the railroads.

On the other hand, the commission allowed the miners to put in their testimony a statement of the property valuations submitted last year by the railroads for purposes of taxation, and also to show what the rates were from West Virginia to points on Lake Erie. Even after the commission makes its ruling, distant as that date may be, the case may be taken up to the Federal Supreme Court by the miners if the decision goes against them.

The Dilemma Troubling the Ohio Railroads

The railroads are on the horns of a dilemma. If they state that they cannot haul Ohio coal for lower rates, then it will be argued that they are discriminating against the coal of Ohio by giving West Virginia a rate which is unprofitable to them. If, on the other hand, they say the West Virginia rate is profitable, the Ohio coal mine owners and miners will ask, "Why then charge so much for hauling Ohio coal?"

The coal operators and the union are trying to prove that 2 mills per ton mile is the cost of hauling on the road from Armitage to Toledo, and consequently the profit is 40c. per ton on the whole trip. The railroads put the cost at 3 mills per ton, and Attorney Wilson for the Hocking Valley Ry. declares that the records in the State Tax Commissioner's office prove that this is so.

The Wheeling Creek and Blaine mines of the Lorain Coal & Dock Co., near Bellaire, Ohio, have resumed work. The former has been idle for 19 months, and the latter has been twice on strike within 30 days. The first trouble in the Blaine mine, it will be remembered, was about the installation of mine-run scales, while the more recent disagreement was about the checkweighman.

The Marietta Chamber of Commerce has shipped a carload of cabbage to the idle miners at Glouster. The cabbage was donated by Muskingum Valley farmers. Typhoid has broken out among the miners in that town.

An attempt is being made to increase the amount of Ohio coal sold in Ohio, the state consuming 60,000,000 tons a year and producing only 37,000,000. It is said that the Ohio State University, of Columbus, rejected Bailey Run coal because West Virginia coal could be bought for 7c. a ton cheaper. If the Ohio coal had received the preference, the Bailey Run mine might have been run 30 days longer. The contract is for 15,000 tons, and the Governor is endeavoring to find out if the contract is irrevocable.

A Strike in West Virginia in the Panhandle District

Just across the Ohio River from Bellaire, Ohio, near Moundsville, Marshall County, W. Va., a small strike involving 80 men arose from an idle rumor that M. J. McQuade, who at the time of the calling of the strike was in Pennsylvania, had determined to reduce wages and had so announced to one of the miners. The plant is owned by the Ben Franklin Coal Co., and most of the coal is used at the Riverside mine of the National Tube Co.

It was alleged that the loading rate was to be cut from 46¾ to 43c., and the undercutting rate from 12½ to 11c. On Mr. McQuade's return with assurances that no cut was contemplated, the strike ended. It seemed likely to become of long duration because while the men were on strike they decided to ask that they be paid for yardage and that William Martin be selected as checkweighman.

The Right of Transference to a Working Mine Is Contested

In Kansas 1200 miners employed by the Sheridan Coal Co. and other small subsidiaries walked out on Aug. 3. The trouble appears to have arisen from a clause in the contract which promised to give work in the other mines of the same company to the men in any mine which may be shut down. The question has arisen whether the W. B. McCormick Coal Co. operation at Mulberry, Kan., is so related to that of the Sheridan Coal Co. at that same place that the men if rendered idle at one mine are entitled to work at the other.

The damage suit of the Coronado Coal Co., etc., vs. the United Mine Workers of America was again presented before Judge Youmans in the Federal court Aug. 2. The issue was argued and submitted on the demurrer of the plaintiff's amended complaint. The damages claimed are for $427,820.77, but as the law requires triple damages in such cases, it is expected that the award will be for $1,283,462.31.

In the anthracite region of Pennsylvania, John P. White has continued his canvass for union members, urging that John P. Mitchell and J. T. Lewis failed to get the miners what they wanted for lack of adequate support and because the men would not join the union in sufficient numbers.

More Men Will Be Tried in Colorado

The trial for murder of Edward Doyle of the United Mine Workers, William Hickey, secretary of the State Federation of Labor, Joe Potestio, John O'Connor and John Cassidy, officers of the Louisville and Lafayette local miners' unions in Boulder County, Colo. respectively, is set for Aug. 23. An attempt has been made to quash the indictments on the ground that the district attorney was not properly elected to office. This plea was overruled by Judge Neil.

Many speeches are being made to bring pressure upon the authorities to release John R. Lawson and to prevent other men from suffering the same penalty. The case of Lawson has been compared to that of Charles Becker, the police lieutenant in New York City. Lawson, like Becker, did not murder anybody, but the jury believed he was guilty of procuring and causing murder. John P. White has made many speeches in the anthracite region before audiences not wholly composed of miners. In all of these he has condemned the conviction of Lawson in unsparing terms. The plea for the defense of Lawson has been the more forceful because that strike leader was formerly a resident of Locust Gap, Northumberland County, Penn. President Gompers of the American Federation of Labor has also issued a denunciation of the conviction. He appeared at a meeting in Philadelphia with Gifford Pinchot, formerly chief of the Bureau of Forestry; Frank Morrison, secretary of the Federation; William Green, secretary of the United Mine Workers of America, and the Rev. Dr. Samuel Zane Batten, chairman of the Church Federation. This meeting in a resolution denounced "the coal companies for their flagrant dominance of the government and courts in various parts of Colorado" and urged the removal of Judge Granby Hillyer Attorneys for John R. Lawson appealed to the Colorado Supreme Court on Aug. 3 for a new trial.

⁂

Pages from a Miner's Notebook; The Script System

The "scrip system" in vogue in many coal camps of the country has received much publicity during the last year. Many articles have appeared in the public press, written no doubt by men who have never actually handled a five-cent piece of scrip, but have gained their knowledge of the "iniquitous" system from some disgruntled employee condemning the system heartily. I have never availed myself of this easy method of getting beer money between pays, but I have heard it damned and reviled times without number by those very ones who seemingly are most willing to take advantage of it when their supply of cash runs short—which usually is not long after payday. There may be many evils connected with the system—evils promoted by the shiftlessness of those who draw scrip. As to that I will not say, but today I witnessed one of the good points of the system.

One of the men formerly employed here who went on strike moved his large family back here the other day. He had been out of work for 18 months through no fault of his own except an abhorrence of being called a "scab," and his family of six were actually suffering. He moved back into the same house he occupied before the strike, but his once-thriving little garden was mostly weeds, and the weeds had taken possession of his neat graveled walks from gate to front door and from back door to coalhouse. He was practically destitute. There was not sufficient food in the meager load of stuff he brought back for three good meals for himself, who needed food to work, let alone his wife and five children.

He is on the night shift and went hungry to work that night. I greeted him as I came off shift, and he returned my greeting with cheery words, but I saw tears in his eyes. We had known each other well in more prosperous days and had been friendly through the lean days now ending. But he did not ask for assistance, and knowing him, I did not offer help. Not so my wife. Scarcely had he left his house when six steaming plates of soup with coffee, bread and such other food as our scanty larder could afford were on their way to the house that is once more to become a home in reality as well as in word. There is a sympathy between mothers of children that surpasses any similar emotion between man and man.

But I am getting away from the subject. My friend worked that night. He worked last night. And today he was allowed to draw scrip. Not much, but sufficient to provide food for himself and family the remainder of the week.

I greeted him as I came off shift. He returned my greeting cheerfully as before, but there is another look in his eyes; the gaunt, drawn look has disappeared from his face. He is a man again. The "iniquitous" scrip system has enabled him to supply the necessities of life to his family without the charity of his friends and without the privation that would have been forced on them had he been compelled to wait for payday. He is already providing the necessities; his first pay will bring again some of the luxuries.

Let those who will, curse the scrip system. My friend and I will not argue, I warrant, but we have learned another lesson.

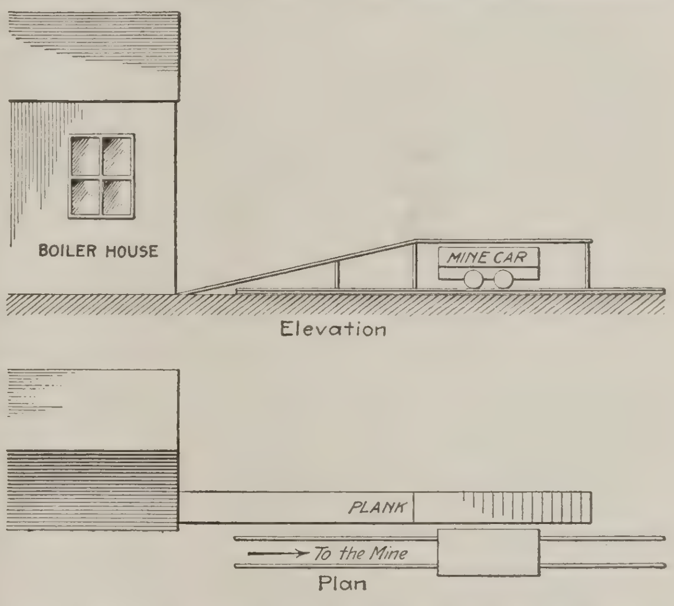
⁂

Raised Platform for Ash Removal

At one of the mines near Brier Hill, Penn., the ashes from the boilers were formerly loaded into wheelbarrows and wheeled to a pile 30 or 40 ft. away. The ashes were allowed to accumulate here for several weeks, when a horse and wagon would be pressed into service to haul them to the dump.

This necessitated the handling of the ashes twice, and in addition the unsightly pile was always in evidence.

Through the erection of a raised platform, as shown in the accompanying sketch, the ashes are now wheeled and dumped directly into pit cars and are then hauled into the mines and utilized as ballast on the haulage roads.



THE RAISED PLATFORM FOR LOADING ASHES INTO MINE CARS

The ground around the boiler house is now always in a neat and clean condition, and the cost of handling the ashes has been reduced.

⁂

When Property Becomes a "Coal Mine"—In a suit for death of a miner, the jury was warranted in finding that the place where the accident occurred had become a "coal mine" within the meaning of the Illinois laws, which provide for the inspection of operated mines, where shafts had been sunk, entries driven and coal had been removed, although the mine had not been put in complete order for the employment of the larger force of men which it was intended to employ when additional appliances should have been installed. (Illinois Supreme Court, Hakanson vs. La Salle County Carbon Coal Co., 170 Southwestern Reporter 617.)

New Anthracite Rate Decision

SYNOPSIS—The new cut in the anthracite freight rates is one of the most sweeping decisions, as affecting the hard-coal industry, that has yet been rendered.

Herewith is presented a summary of the principal points covered in the decision of the I. C. C. in the anthracite rate case as abstracted from the *Boston News Bureau, Philadelphia News Bureau* and other sources. In its decision the commission holds:

1. That the rates on anthracite coal from producing districts in Pennsylvania to the tidewater ports and certain Eastern interior points are unreasonable.
2. That the carriers, by means of trackage arrangements and the free transportation to junction points in the mining region of coal exchanged by their allied coal companies, have extended the advantage of intra-line transportation to their coal companies to the prejudice of other shippers.
3. That concessions and offsets granted by the carriers to their allied coal companies in the form of interest charges, royalty earnings, the use of valuable property and inadequate rentals, the free use of the carriers' funds and credits are as pernicious as direct cash rebates. Such concessions and offsets are unlawful.
4. That lateral allowances paid to a coal shipper in accord with an agreement alleged to be additional use for a facility furnished by the shipper are unlawful rebates.
5. That with but few exceptions the railroads own the entire outstanding stock of the coal companies whose product they transport.

The changes in anthracite rates are summarized in the following:

COMPARISON OF THE OLD AND NEW RATES

	Prepared Sizes		Steam Sizes	
	Old	New	Old	New
Del., Lacka. & Western:				
Hoboken (tidewater)....	$1.60	$1.45	$1.45	$1.35
Paterson, N. J..........	1.60	1.45	1.45	1.23
Newark, N. J............	1.60	1.40	1.45	1.30
Binghamton, N. Y.......	1.65	.90	1.50	.82
Elmira, N. Y............	1.65	1.25	1.50	1.14
Corning, N. Y...........	1.90	1.35	1.65	1.17
Dansville, N. Y.........	2.00	1.60	1.75	1.40
Syracuse, N. Y..........	1.90	1.40	1.65	1.22
Utica, N. Y.............	2.00	1.50	1.75	1.31
Lehigh Valley:				
Jersey City (tidewater).	$1.60	$1.45	$1.45	$1.35
Newark, N. J...........	1.60	1.45	1.40	1.30
Waverly, N. Y..........	1.65	1.15	1.10	1.05
Ithaca, N. Y...........	1.65	1.45	1.50	1.32
Depew, N. Y............	2.00	1.95	1.75	1.71
Rochester, N. Y........	1.90	1.80	1.65	1.61
Erie R.R.:				
Jersey City (tidewater)..	$1.60	$1.45	$1.45	$1.35
Paterson, N. J..........	1.60	1.35	1.45	1.22
Newark, N. J............	1.60	1.40	1.45	1.30
Middletown, N. Y.......	1.60	1.05	1.45	.95
Hornell, N. Y..........	2.00	1.60	1.75	1.40
Rochester, N. Y........	2.00	1.85	1.75	1.61
Central R.R. of N. J.:				
Jersey City (tidewater)..	$1.65	$1.60	$1.40	$1.35
Elizabeth, N. J..........	1.55	1.40	1.40	1.30
Somerville, N. J.........	1.55	1.20	1.40	1.09
Delaware & Hudson:				
Windsor, N. Y...........	$1.65	$0.85	$1.40	$0.92
Ninevah, N. Y...........	1.65	.90	1.40	.76
Oneonta, N. Y...........	1.75	1.20	1.50	1.03
Albany, N. Y............	1.95	1.60	1.60	1.31
Troy, N. Y..............	1.95	1.60	1.60	1.31

Rates for intermediate points will be arranged on a similar basis. A different schedule of rates is given on shipments consigned free on board vessels or for reshipment by water. Under this class of shipments Jersey Central rates of $1.55 on prepared sizes and $1.40 on smaller sizes to Elizabethport, N. J., are reduced to $1.40 and $1.30 respectively. Reductions for other roads on such shipments are:

Philadelphia & Reading to Port Reading, N. Y., from $1.55 and $1.40 to $1.40 and $1.30.

Lehigh Valley to Perth Amboy, N. J., from $1.55 and $1.40 to $1.40 and $1.30.

Erie Railroad to Weehawken, N. J., from $1.60 and $1.45 to $1.45 and $1.35.

Joint rates by Erie and New York, Susquehanna & Western to Undercliff, N. J., from $1.60 and $1.45 to $1.45 and $1.35.

Joint rates by Wilkes-Barre & Eastern and New York, Susquehanna & Western to Undercliff from $1.60 and $1.45 to $1.45 and $1.35.

Lackawanna to New York lighterage stations from $1.58 and $1.43 to $1.45 and $1.35. Ontario & Western to Weehawken, N. J., from $1.60 and $1.45 to $1.45 and $1.35.

Joint rates of Delaware & Hudson, Erie and Susquehanna to Weehawken from $1.60 and $1.45 to $1.45 and $1.35.

Joint rates of Delaware & Hudson with Ontario & Western to Weehawken, N. J., from $1.60 and $1.45 to $1.45 and $1.35.

Joint rates for Delaware & Hudson, Lackawanna, the Pennsylvania and Northern Central to South Amboy from $1.55 and $1.40 to $1.40 and $1.30.

THE TRADE AND THE ORDER

The effect of the order has upset trade calculations. At best the outlook was not encouraging, but the consequent uncertainty as to great matters has made the immediate future of the distribution and price of coal dubious. The demand for coal at the moment is light, but this might have been changed materially in the next few weeks.

Old observers now expect that coal dealers and consumers will be distracted by the new prospect, and will make sparing purchases, and await a clearing of the situation. Whether the companies go into court or whether the commission's order goes into effect on Oct. 1, the consumer of coal will be in doubt as to the proper course to take as to the autumn requirements and will naturally restrict operations.

Under the usual rule the consumer will pay the bill, but it will not be done in a hurry, pending developments which will be perplexing and mystifying to every one. The trade has other matters of interest before it, including the wage scale and new and stronger competition of bituminous following the Interstate Commission's order.

A leading official of one of the largest coal companies says the decision will have no effect on the price paid by consumer. The companies which suffer by decrease of income from transportation will, through coal companies in which they are interested, increase the price of coal at the pit mouth. The consumer will pay the same amount on line or at tide as he has been doing. In effect there will be no real results in cheapening of the commodity. Delaware & Hudson Coal Co., Pennsylvania Coal Co. of the Erie, Coxe Bros. & Co. and Lehigh Valley Coal Co. investments of Lehigh Valley R.R., Lehigh & Wilkes-Barre

Coal Co. of Jersey Central and others will benefit and the railroads will not suffer. Coal men are thus disposed to view less seriously than at first the supposedly drastic quality of the decision.

Official Opinions on the Decision

President L. F. Loree of the Delaware & Hudson Co. criticized the Interstate Commerce Commission in a statement he issued on the anthracite-rate decision. He criticizes the commission for the way its investigations were conducted and suggests that the loss in revenues will not be restricted to the coal-carrying roads, but will extend to the other Eastern roads. President Loree in part said:

"The carriers believed that it would tend toward a clear understanding of the problem of anthracite transportation if the commission could be induced to go to the anthracite region and personally to witness some at least of the principal operations incident thereto. An invitation was accordingly extended, through counsel, but the commission failed to avail itself of the opportunity.

"The best year of the last 16 for the anthracite carriers, as shown by the financial results of their operations, was the year 1907. In that year the net corporate income, after paying wages, other operating expenses, taxes and interest upon indebtedness, averaged only 7.41% of the cost of their properties, while in 1914, the worst year, it fell to 5.06%.

Gross Receipts of the Railways

"Omitting the Pennsylvania system, the total gross receipts from all operating sources of the other railways serving the anthracite region in 1913 was $274,593,886, and no less than $85,618,436 of this aggregate, or 31.6%, came from the transportation of anthracite. Disregarding their passenger business, which all authorities agree does not produce an adequate return upon the property used in the public service, it appears that 44.9% of the freight receipts of these railroad companies was derived from anthracite."

Vice-President Loomis of the Lackawanna said: "The practices which the commerce commission has scored so severely were corrected more than a year ago. The reduction in rates does not affect Lackawanna so severely as those roads whose traffic runs almost entirely to tidewater, like the Reading and the Jersey Central. The ruling of the commission is entirely arbitrary, and there is no appeal. It is interesting to note that the long investigation by the commerce commission was not started because of the complaint of any shipper, but was carried out on the commission's own initiative."

President F. D. Underwood of the Erie says: "If the reduction of the coal rate goes to the consumer the gain to them is apparent. But should it go as it has in the past to the middleman, we have the spectacle of the owners of railway securities being robbed for the benefit of the dealer. In other words, it simply means taking the money of the many for the benefit of the few. This is a ruthless, unnecessary proceeding, giving a serious blow to all investors, among which are savings banks and insurance companies."

It is understood on excellent authority that the anthracite roads will appeal this decision and carry the matter through the courts. In this event the new schedules may not become effective for some time.

The Trend of Conditions on New Contracts

July and August are usually very dull months for contracts, and this year is no exception. The Narragansett Electric Lighting Co., Providence, R. I., placed its contract early in August for 40,000 tons of New River with the Eastern Coal Co., of Providence, but the latter, by reason of location, is the only dealer in position to name a favorable price and the award was not in any way significant. It is understood it was closed on practically the same basis as last year.

Except for this order not a fair-sized piece of wholesale business has been placed in New England since July 15 that is in any way significant. A few large buyers, mostly in the textile industry, have refrained from making comprehensive contracts, and thus far they have arranged for current requirements in the open market. Purchasers of this kind will not make contracts until they are satisfied that the low point of the season has been reached. The supply of water power has a material bearing on probable consumption, and the uncertainty over water freights along the coast is another important factor.

The orders placed the past month were almost exclusively of the municipal or county or state character. As a whole the awards have been on about the same price level as in 1914, there being no pronounced trend either way. Aside from special cases, private concerns in New England seldom enter the market for contract at this season. The pressure is all for contracts as early in the year as possible, and from July 1 ordinarily there are only fugitive items to report. So far as 1915 is concerned, the record of the year is about made up, particularly on what are known as the comprehensive orders.

*

Exports from Philadelphia

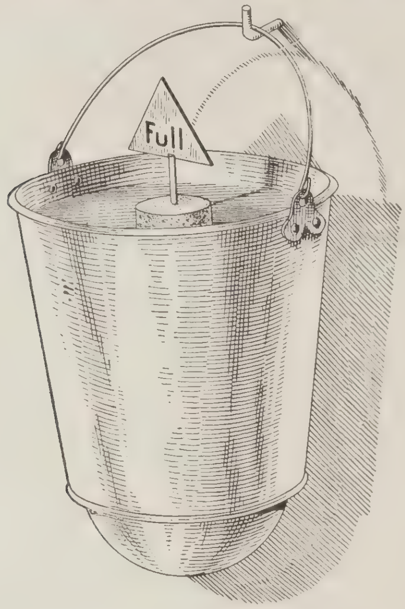
The port of Philadelphia is enjoying a boom owing to the vast quantities of material being exported to foreign shores, not only to the belligerent nations, but to those countries whose ordinary sources of supply have been cut off. One of the commodities greatly contributing to this increase is bituminous coal. For the six months ended June 30 the shipments totaled 406,963 tons, or a gain of over 30 per cent. For the three-month period ending with June there was exported 290,340 tons, being a gain of 125 per cent. The July tonnage will approximate 160,000, while last July less than 50,000 tons was shipped.

Most of the cargoes are destined to Italy, France, Spain, Brazil, Norway, Argentine Republic and Chile. These countries heretofore received the bulk of their supply from Wales, France and Belgium, but they have all been compelled to seek other sources since England has practically placed an embargo on coal, while the fields of France and Belgium are held by the German army. Inquiries are received daily for American coal, but difficulty is experienced in securing sufficient ships, and the rate is high. This scarcity of vessel tonnage has resulted in many boats, that were practically worn out being refitted.

The bunker coal men who were deprived of the greater portion of their trade by the withdrawal of many of the merchant ships are taking advantage of the opportunity for an outlet for their coal in the rapidly developing bunker trade that has arisen in connection with the opening of the Panama Canal.

An Indicator for Fire Buckets

The accompanying illustration shows an ordinary fire bucket equipped with a simple and convenient contrivance for showing the amount of water it contains. The device consists of a cork or metallic float with a stiff wire spindle passed through it, on the top of which is fastened a triangular piece of sheet tin or aluminum, painted and lettered in colors that will contrast with the surroundings.



A SIMPLE FIRE-BUCKET INDICATOR

This indicator saves the watchman from climbing on workbenches, up posts or the sides of the walls to see that the water buckets are properly filled, as insurance associations require.

When the bucket is full, the sign is visible for a considerable distance, but when the water has evaporated so that the bucket is only partly filled, the float disappears below the rim. These floats would also be an aid to the insurance inspectors when visiting plants which have adopted these simple devices.—C. D. Parkhurst, in *American Machinist,* July 22, 1915.

Western Rate Case Decision

The new decision of the Interstate Commerce Commission in the Western rate case denied the request of the carriers for increased freight rates on a majority of the schedules under consideration, but allowed certain increases. It particularly admitted the contention of the Illinois coal operators to the effect that their interests would be injured by an increase in coal rates to points in Wisconsin and Minnesota as well as the Dakotas. The opinion was advanced that the cost of hauling coal to Wisconsin and Minnesota justified increases in rates, but that it did not justify an increase in the Dakota rates. In suggesting increases in the lake rates it says:

"From other facts of record it appears that past increases in rates from Illinois, without corresponding increases in the rates from the docks, have resulted in relatively lessening the amount shipped from the Illinois mines."

The greatest fight during the hearings on the proposed increases centered around the rates on grain products, live stock, packing-house products and coal. The railroads lost in every instance except on the coal rates. Even this was only a partial victory, inasmuch as the increases to South Dakota territory were not allowed, and the commission suggested that the lake rates from Pittsburgh should be increased in proportion to the advance in rates from Illinois territory. How much the carriers will profit through this decision, especially on coal, is uncertain and problematical, but they are generally dissatisfied with the outcome.

While there has not yet been sufficient time to thoroughly digest the decision, it is evident that the commission has made rulings decidedly adverse to the Western coal interests. The effect will be to eliminate, in a large measure, all but the very best Western fuels from the Minneapolis and St. Paul markets. They have always been very nearly on a parity with eastern coals via the Lakes, and the differential against the Illinois product in the "Twin Cities" will now be about 10c. per ton. It is apparent the docks will benefit materially, unless the Western operators elect to sell their coal below cost of production.

Both the coal shippers and railroads are disgruntled with the decision, and it is possible the rail interests will ask for a rehearing. It is quite evident that the Illinois operators will lose a large slice of territory in which their coals have been sold and in which they have been marketing an increased tonnage for several years past. Prominent southern Illinois coal operators are of the opinion that the commission has brushed aside all protests of the coal men and decided in favor of the roads, and the attitude of the commission contrasts sharply with its opinion made but a few months ago in regard to freight rates in the Eastern territory.

Annual Meeting of American Mining Congress

The annual meeting of the American Mining Congress will be held at San Francisco beginning Monday, Sept. 20, and the American Mine Safety Association will also have its meeting in the same city on Sept. 23 and 24. The week beginning Sept. 20 should see more mining men in San Francisco than in a long time. The headquarters of the Mining Congress will be in the Palace Hotel, and delegates and members will receive special rates of $6 a day for a room occupied by two persons and $4 per day for one person.

Carl Scholz, president of the congress, intends to make up a party of possibly 15 to 20 members and their families to occupy a special car leaving Chicago at 10 a.m., Sept. 15, on the Rocky Mountain Limited, which will reach Denver at 2:45 p.m. the next day; leave Denver at 5 o'clock that evening on the Union Pacific road, arriving at Salt Lake City the next day at noon; remain there over night and leave on the early morning train for San Francisco, arriving at destination Sunday morning, Sept. 19.

Any Eastern coal or mining men desiring to join this party should advise Mr. Scholz in Chicago as to what space they will require, so that suitable accommodations consisting of compartments and drawing rooms may be provided in a special car. Since a large attendance is expected, as early notice as possible should be given of reservations desired.

Editorials

Explosibility of Coal Dust

A coal dust with a high percentage of moisture is not necessarily inexplodible though it has been frequently asserted that it is. The tests of the United States Bureau of Mines have shown that a certain coal dust from Utah with nearly 15 per cent. of moisture will explode with a rise in pressure far greater than that obtained on exploding some of the coal dusts of West Virginia containing less than 1 per cent. of moisture. The water in that Utah coal does not appear to make it safe. That, at least, is the testimony of experiments on a laboratory scale.

In the Utah coal mentioned there is much volatile matter, but in that from West Virginia far less, and the great quantity of bituminous matter in the first coal appears to overcome the immunity from inflammation which might otherwise result from the presence of uncombined moisture.

But all immature coals contain not only much water, but also much volatile matter, so it is not safe to suggest that immature coals are safe; and on the other hand, there is abundant evidence that while mature coals are not easily inflammable in laboratory experiments and do not generate high pressures, yet in actual tests, when dusts are detonated, the dusts from such mature coal can produce most disastrous effects; for being able to generate the maximum heat, they assure the greatest possible expansion and the highest pressures.

The safety of Montana coal mines from explosions has been ascribed to the presence of moisture in the coal, and it is true that the water content of the samples of coal that have been investigated is high, while the inflammability is abnormally low. But while the moisture is possibly a cause it is not the sole reason for the safety of the dust. Apparently its nonfriability is not an important cause either, for even when ground fine for inflammability tests the dust generates little pressure on inflammation by an electric current.

The two Montana dusts tested by the Bureau of Mines were reasonably low in ash, and there is not a hint of the reason why they should be so resistant to inflammation. Until more is known and until the value of the tests of inflammation as a true index of explosibility is proved, it is best perhaps to sit on the fence and declare that we do not know why one dust explodes with ease and violence and another dust with difficulty and without energy. All we do know is that it is almost impossible to explode under working conditions a mineralized carbon dust like anthracite.

As further evidence of the explosibility of substances containing moisture it may be added that no difficulty has been found in exploding the dusts of grain, by intention or by accident. These dusts all appear to contain from 6 to 10 per cent. of moisture, and some also as much as 16 per cent. of ash. But these impurities do not prevent such dusts from the sudden propagation of flame.

If the reader will consult "The Explosibility of Grain Dusts," by David J. Price and Harold H. Brown, of the Millers' Committee of Buffalo, N. Y., he will find that yellow corn with 10.06 per cent. of moisture ignited at 1025 deg. C., while oats with only 6.79 per cent. of moisture resisted ignition till raised to 1280 deg. C. The yellow corn to which we have referred when exploded at 1200 deg. C., gave a maximum pressure 1.83 times that of Pittsburgh standard coal dust, the highest pressure observed; but when a drier wheat dust with about 7 per cent. of moisture exploded at that same temperature, despite its dryness, it only gave, roughly, half the pressure. So a moisture-laden carbohydrate is not without its dangers. Though moisture probably is a protection it is not an unquestionable guarantee of safety.

The Wasteful Yet Economic Beehive Oven

Much has been said in recent years concerning the wastefulness of coking coal in beehive ovens. To this subject much space has been devoted in the public press, both technical and popular. The major portion of coke made in this country has been and still is burned in beehive rather than in byproduct ovens. In this respect the industry presents a marked contrast to the practice in some other countries, Germany in particular.

Wasteful as our methods may appear, it should be borne in mind that the coke industry, like all other industries, makes permanent progress through economic expediency only. When circumstances are such that an attractive dividend may be earned on a given investment, regardless of whether the sum involved be one dollar or a hundred million dollars, it is reasonably certain that the investment will be made. Byproduct coke ovens cost more money than do beehive ovens. They are, however, being built about as rapidly as good engineering economics will justify their erection.

In considering the replacement of beehive ovens by those of the byproduct variety one important fact should not be overlooked—that is, the most bulky as well as, under ordinary circumstances, most valuable byproduct evolved in coking in the retort oven is the gas. Unless this can be used at or near the oven, either in some industrial process or for domestic purposes, no benefit is secured in byproduct coking commensurate with its increased expense.

It is this consideration of the utilization of the gas that is leading to the establishment of byproduct ovens only at large centers of population or at points of concentrated metallurgical or industrial activity. The past few years have witnessed the establishment of successful byproduct coking plants at steel mills, such as those at Joliet, South Chicago and Gary, and at several cities—namely Indianapolis, St. Louis and Chattanooga. At these points the gas may be successfully utilized either as a metallurgical or a domestic fuel, or both.

The coke-makers of the United States can hardly be expected to radically alter existing and well-established methods of manufacture to suit merely the whims or beliefs of ultra-conservationists. When the time arrives when byproduct coke ovens become economically expedient, we may logically expect that byproduct ovens will be built, and the byproducts secured by this method of coking will no longer, as now, literally "go up in smoke" to pollute the atmosphere, destroy vegetation and damage property. Until that time arrives, however, it is highly probable that beehive coking will continue to be practiced.

⁂

The "Adscripti Glebae" of Modern Commerce

In earlier days in Europe the peasants were attached to the soil. When it was sold they went with it as part of the bargain. They were sometimes known as *adscripti glebae*, or serfs of the soil, though these words were coined by Roman jurists to express the condition of *coloni* who were not altogether at the pleasure of the land owner. These adscripts worked and were sustained by the owner of the estate, whether prince or priest, lord or monk.

While there were many instances doubtless of liberality, there were also numberless cases where the owner of the property contented himself with giving the adscripts the very meagerest of living. From these serfs of medieval and premedieval days it is a far cry to our present conditions. But there is an analogy, not to be pressed too far, in the relation between the railroads and the coal corporations.

A coal company is an adscript, attached to the soil. It can only get its product where it owns a coal property, and it can only ship its property by the railroad which runs to that piece of coal land. Only rarely can any choice of railroads be made. But on the other hand, the man who makes a valve or mining machine can build it in Connellsville, Penn., or in Columbus, Ohio. He can thus choose his railroad and can dicker for rates.

Even if he is established and has his factory built, he can look elsewhere, and eventually move his machinery where freights and other conditions are favorable. He can probably even get the money for the change and for building a factory or part of it from the town to which he moves. He can thus register an effective complaint against the railroad if it keeps him from an available market or if it prevents him from making a profit.

But the coal-mine owner is fast bound to the soil, and the railroad knows that this is a fact and regulates rates accordingly. Even if the mine is closed down, the railroad company figures it will remove the tonnage eventually. The income may be delayed, but it is certain as death and taxes that some time it will be received.

The gross earning is the product obtained by multiplying the tonnage of the coal area and the freight rate. Delay it, and it will not be less; accelerate it, and it will never be more. And if the operator holds the land as in a dead hand, taxes, interest and depreciation will waste his capital, leaving the railroad but little affected.

The railroad feels also in many cases that coal taken beyond its confines is assisting other railroads at its own loss and therefore is but little interested in giving a liberal rate.

How different is the situation in dealing with an industry which is free to select a site. The railroad company makes for this trade the best dicker it can secure. Overhead charges that must be borne in any event, whether the traffic is hauled or not, are generally overlooked. The interest on the cost of railroad construction must be paid, but it is not met by the factories so much as by those operations which are *adscripti glebae*—the coal mines, the clay works, the quarries and the lumber mills.

Moreover the railroad remembers that these latter all have a certain time to run. They may bring a fleeting population, but no permanent business; whereas a factory established successfully brings an income for as long as freight rates are equitable.

Thus it is that the mines are burdened with unreasonable freight charges. It is generally recognized that despite the fact that heavy freightage is the most desirable because the most cheaply handled, it is nevertheless the most grievously burdened. The general public would think the price of coal ridiculously low and would regard the coal operator as a public benefactor if when the coal bill had to be paid the railroad company did not ask two or three times as much as the operator and the retailer did not, as he often does, add for his services as much as the operator asks for the coal.

In the older states the railroads are not really profiting by these high rates. It is well known that in the new states, where they do not obtain, the railroads are making money out of the large tonnage they haul. They are proving that a liberal policy pays and that the uncertain operation of impoverished coal mines which can only work in busy seasons does not remunerate the railroad company. A fairer policy would do good all around. The railroad company can hardly afford to wait for this good business any better than the coal operator. Because the serf is a serf does not prevent it being good policy to see that he is well fed.

But the railroads in the older coal states cannot see it, though the condition in Ohio may yet make it clear to them. The operator has been restrained for years; in fact, he has made little money since the old grafting years when conditions were made favorable if the railroad men were presented with stock or were assisted with money. Since a more strait-laced time has succeeded, no one is enriched—neither the railroad, the coal men nor the transportation officials, except where a most liberal policy is pursued which awards the first a steady, increasing yet remunerative traffic, the second a regular, growing and profitable business and the third salaries in accord with the importance of their public services.

In this review of the adscripted character of the coal industry no attention has been paid to its restriction to the kind of coal bed, grade of coal, etc., on its land which is well noted by F. I. Pearce in this issue. From a mine practically but one kind of product can be obtained, whereas a factory can modify its output to suit its pleasure, and a firm producing plowshares may shortly afterward be making mine shovels and without a change in base. This, however, is a matter which explains the misfortunes of coal companies rather than the part which railroads have in them.

⁂

Don't forget that the Sept. 4 issue of *Coal Age* will be devoted to mine ventilation, and we invite articles on this subject from all our readers who have at hand interesting data concerning successful ventilating plants or methods. Send your contribution at once.

Sociological Department

Modernizing Morea

Housecleaning, either indoors or out, is best done by a woman. Acting on this basic principle, T. M. Dodson, who directs the affairs of the Dodson Coal Co., consulted Dr. T. C. Rutter, his resident physician at Morea, a year ago, and the result was the acquisition of the services of Miss Anna Barager, a graduate nurse, who has made Morea one of the best looking and most sanitary mining towns in the anthracite region.

Morea is now 27 years old, but several years ahead of its time. It contains about 145 houses and some 1100 people, and it was not an unpresentable place a year ago, but it didn't suit Miss Barager. There were ditches to be cleaned out, garbage to be hauled away, unsanitary outhouses to be moved farther away from the homes, and when everything was spick and span it had to be kept in that condition.

Home Keeping Taught and Sanitary Stable Equipped

The inhabitants of Morea are of many nationalities and at first they didn't understand very well why such radical innovations were necessary. But the visiting nurse was inflexible. She was given a team of horses and a cart, and authority to urge anyone who didn't like clean, sanitary surroundings to go and live elsewhere.

PART OF MOREA SHOWING STORE, SCHOOL, CHURCH AND STATION

VIEW OF MOREA LOOKING UP VALLEY

STORE OF THE MOREA SUPPLY CO.

VIEW OF MAIN STREET OF MOREA COLLIERY

SANITARY BARN AND INSPECTED STOCK

PICNIC GROUND SHOWING HANDBALL COURT, KELLY SLIDE, SEESAWS, DANCE PLATFORM AND BALL GROUND

But public health is not merely a matter of clean houses, yards and streets and excellent hospitals above and below ground. Miss Barager went indoors and taught the mothers how to feed and clothe and bathe their babies properly. There are from two to four in each family and more often four than two. The quantity and quality of the local milk supply was another problem, and Morea now boasts a sanitary cow-stable with 16 blooded cows.

There are also a fine athletic field which cost many hundreds of dollars, a summer dancing hall, picnic grounds and a clubhouse equipped with shower baths, hot and cold water and all conveniences. In the way of entertainment there are moving pictures every night at the club and dances are held frequently. The building is supplied with card and pool tables, and in its reading room the latest magazines are filed. On holidays and important payday Saturdays there are local athletic meets, and at stated intervals there are contests with the Beaver Brook colliery of the Charles M. Dodson Co., comprising races, tugs-of-war, baseball games and many other events. Morea has a fine baseball team.

BASEBALL DIAMOND

Sound minds go with sound bodies, and the local school makes good the adage. Miss Barager added a sewing class to the curriculum, and there is even an extra school session held twice a week for foreigners. But this is small, as most of the children speak English. In a recent report Superintendent Noonan, of the schools of Mahanoy township, highly commended Miss Barager's work and its effect upon school attendance.

There are over 800 men who work at the Morea colliery. About a hundred of them come in on early morning work trains from Frackville, Mahanoy City and Pottsville, but the rest live near the mine in the company houses. This concentration has enabled T. M. Dodson to exercise the beneficial control over their health, surroundings and entertainment that was the primary aim of the coal company, as outlined in the foregoing statement. Throughout the anthracite region there is a similar tendency toward not only the sanitation but beautifying of the collieries and mining patches. Thousands of dollars have been spent by the Kingston Coal Co. in the making of five big playgrounds for the children of the mine workers. Grass plots, flower beds, even a fountain, and whitewashed walls and fences have long since improved the appearance of many Lehigh Valley collieries and those of E. B. Jermyn & Co. The great Loomis Colliery of the Delaware, Lackawanna & Western R. R. Coal Mining Department looks like a small university and its Concrete City, with a sanitary sewage system, is a model mining village. These are only a few detached instances of the many physical and æsthetic improvements which both the large and small companies are making.

⁂

A State Safety Exhibit

The Pennsylvania Department of Labor and Industry has an interesting safety exhibit which it is placing in store windows in big industrial centers. J. P. Jackson, state commissioner of labor and industry, is the originator of the movement.

Such exhibits under the aegis of the state have a peculiar value. The admonitions of the operator may seem animated by self-interest, as indeed in part they are; but coming from the state itself and sustained by the taxes of all the citizens it gives the movement a wider meaning and suggests what is equally true—that all citizens have an interest in the safety-first movement, whether employers or employees. And this applies even to farmers who are said, not to employ a man, but to hire him. As the men are hired, not employed, of course they should not be indemnified in case of injury. Or is the distinction merely one of voting strength?

⁂

In the Absence of System and Order in the lamp-room, as regards cleaning, fitting the parts and handing out the lamps, curious things may occasionally happen. One of the most amusing—of course it might have had serious consequences—occurred a few years ago in South Wales. When all the men had been dispatched below, the alarming discovery was made that someone had got a safety lamp without having the protecting gauze upon it, the gauze having been found loose in the lamp room. A miner nearby was sent down to make a search. He traveled all round the pit and came out again without finding the culprit. Then, but not until then, was it found that this amateur detective was the very man who had the lamp without the gauze.

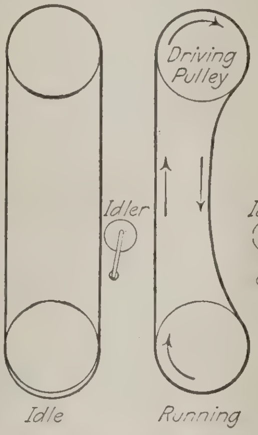
Discussion by Readers

Mining Machinery--Belting

Letter No. 2—Referring to Letter No. 1, regarding belts for driving mining machinery, *Coal Age*, Aug. 7, p. 227, I am not going to criticise any of the statements made by Chief Electrician. What he says in favor of horizontal slack-running belts with the tight or pulling side on the bottom whenever possible is correct.

Horizontal belts are always preferable where they can be employed; but it is often necessary to use vertical belts, and I wish to add a few comments to the remarks made in the previous letter. I want to suggest what may at first seem impracticable, but is nevertheless true; namely, a vertical belt can often be run slack the same as a horizontal belt and with the same advantage.

I have in mind a case where a vertical belt has so much slack that it drops away from the lower pulley when not running. I have illustrated this on the left, in the accompanying figure, which represents the belt not in operation. In this position it would be impossible to start a belt without the use of the idler shown at the side of the belt. When it is desired to start the belt the idler is thrown against it so as to take up the slack and bring the belt into contact with the pulley. In the case to which I refer there was so much adhesion between the belt and the two pulleys that, after starting the belt, the idler could be swung back and the belt would still hold fast to the lower pulley, as shown on the right in the figure.



A VERTICAL BELT

While this scheme is not to be recommended generally, it can often be applied in the case of large slow-running belts, especially where there is considerable adhesion between the belt and the face of the pulley. The pull on the tight side of the belt, being resisted by a slight drag on the slack side, is sufficient to keep the belt in contact with the lower pulley. This of course would not apply to small belts, or even large belts when running rapidly. As explained in the case of horizontal belts, the slack has the same effect to increase the arc of contact on both pulleys, and as a result the belt will exert a greater pull or transmit a heavier load.

New York City.

Preventing Mine Explosions

Letter No. 6—I notice that Wm. Crooks, in his Letter No. 3, *Coal Age*, July 24, p. 143, criticizes the statement of Mine Inspector Rose, which appeared in the issue of May 8, p. 819. The statement was to the effect that "As long as coal is mined, disasters must occur."

After reading carefully the article of Inspector Rose, I am forced to conclude that the statement is very reasonable. We might as well criticise the statement, "As long as large cities exist, fires must occur." We realize that, in spite of the fact that every large city has a rigid fire-inspection system and maintains an elaborate and expensive fire-fighting apparatus and enforces underwriters' fire insurance rules, fires still occur with frequency. It will be generally agreed that the latter statement is a reasonable one, and if so, then the statement made by Mr. Rose is equally reasonable.

In spite of all precautions that coal operators and miners can take, and in spite of all the means used for the efficient ventilation of the mine and the installation of effective sprinkling systems to keep down the dust, and other like precautions, it must be acknowledged that mine explosions still continue. Their occurrence will be less frequent, no doubt, in proportion to the precautions taken and the means employed to avoid such disasters. But after all is done, I am prone to think that we will always have explosions occurring in mines as long as the coal-mining industry exists. I believe this as surely as I believe that fires must always occur in large cities. However, this conclusion makes it all the more necessary that the suggestions offered by Mr. Crooks at the close of his letter be carefully followed, though we cannot hope for the entire elimination of such accidents.

R. R. DUNLOP

Columbus, Ohio.

Prohibition and Welfare Work

Letter No. 1—I was much interested in reading the article on this subject written by H. M. Wassum, *Coal Age*, July 3, p. 3. After referring to the large sums of money expended annually by coal companies for the protection of the lives of their workmen and drawing attention to the fact that the companies are not only obeying the mine laws but are taking extra precautions whenever they think it necessary, Mr. Wassum says: "The men must be trained to become miners and not laborers. They must be shown that they have a responsibility and that they must assume it."

Mr. Wassum wonders if the coal companies are receiving full value for the money they spend for these purposes. My observation and experience have convinced me that although the first-aid work and organization have accomplished much and led to great improvements in the mining of coal the investment has actually brought but slight returns to the operators. I have decided that there are several reasons for this result and that the coal companies are in part to blame:

1. It is important that coal companies should see to it that their miners are not using too much booze. They should do everything possible to exterminate the saloon and stop the liquor traffic in mining towns and districts. In two mining towns I found that general merchandise checks issued by the company were taken at saloons in

pay for drinks and redeemed by the company. Such merchandise checks should not be negotiable. The practice enables the miner to squander his wages in drink, and pay day finds his family without means of procuring the little luxuries of life, outside of the bare necessities provided at the company store.

2. In most of our mines there is a large admixture of foreign labor, representing every language and religion. There are many Greek and Roman holidays, when the men lay off from work and there is much carousing. Many of the men are unable to return to work the following day, and some go to the mine in no condition to safeguard themselves or their fellows. As a result they engage in many dangerous practices, bumping the coal off the solid, firing unsafe shots, entering dangerous places in disregard of danger signals or other warnings, etc. It is up to the operator to reduce the dangers from this cause by every practicable means. It may be possible to provide attractions on such holidays that will draw the men from the saloons and interest them in more profitable and less harmful ways. Let these attractions be such that the foreigner will be interested in them.

3. There is in most mines a certain lack of discipline for what are too apt to be regarded as trivial violations of the mine rules and regulations. For example, when they can do so without being caught, miners are prone to do many things that are strictly forbidden. Although in most mines a special entry is provided for the men to travel on their way to and from their work, they will frequently slip out on the main-haulage road. It happens occasionally that the men doing this are caught in the act by the foreman or one of his assistants, but for this violation they are rarely laid off more than a day or two, which they do not regard as serious.

In many cases the mine law is violated by a foreigner who is not acquainted with its provisions. This shows the need of miners' training schools, especially for foreigners. In 1901 my brother lost his life through just such carelessness and ignorance as I have mentioned. It is important, therefore, that miners should understand the mining of coal under all conditions, in order to make safe and efficient workmen. Otherwise, many accidents will occur in the mines.

A short time ago a man who had been a blacksmith came to our mining town and secured a place to work in the mine. The first day he went to work I visited his place when he was preparing to fire a shot. He was working but a few yards from the heading. He was using squibs, and after he had made one or two unsuccessful attempts to fire the hole, I went in and examined the shot. I found three squibs stuck fast in the mouth of the hole. The man had claimed to be a good mechanic and to understand his work, but this incident shows that no matter how good a man may be in one line of work he must know how to dig coal before he can become a safe or successful miner. It shows, again, the need of a miner's training school.

The problem presents many difficulties. There is a peculiar lack of interest on the part of most of the foreign labor in mining in regard to such training schools. Recently I made an attempt in company with another man, to organize and establish such a school. Out of 150 foreign miners whom we approached, we were able to secure only five names for enrollment. We had much the same success in trying to interest foreigners in our political club, where they could be taught the principles of American politics and become better informed in regard to the mining industry. One man would say, "No, I will only be here a couple of years and then go back to the old country." Another would state that he could not live any better, if he should learn the English language, and claim that he is "too old to go to school."

Permit me to say in closing what I have stated in previous letters, that the proper certification of miners is one of the most important and necessary features of the coal industry in this country. I want to suggest that where coal companies are unable to start and maintain such training schools for their miners, this work should be undertaken by the Bureau of Mines, and a few years would see good results.

JOHN MAJER.

Listie, Penn.

Letter No. 2—The letter written to Superintendent O. P. Rater by an Austrian, and printed in *Coal Age,* July 17, p. 80, furnishes much food for reflection. The writer of the letter is seeking a job for himself and his companion in another mining district, and is willing to relinquish his present steady work and fair pay for less regular work and under conditions far less favorable in the mine. The reason given for desiring the change is that the place is "too dry" for himself and his companion.

To men who regard the drink habit as an evil, the picture presented here is a gloomy one, revealing as it does the craving for drink of a large portion of our mine workers. It emphasizes the fact that when removing the places where liquor can be procured it is absolutely necessary to supply something as a substitute. One addicted to the drink habit and failing to secure liquor at the common resorts will either take in its place what the "bootlegger" has to offer or resort to the use of drugs.

The truth of this statement is clearly proved by the reports coming from Russia regarding the effect of the recent edict against the manufacture and sale of "vodka"—the favorite Russian drink, which contains a high percentage of alcohol and is intoxicating. Statistics that appeared in the July *Literary Digest,* as prepared by Dr. Novaselski, show that 313 deaths occurred from delirium tremens, in the period extending from Aug. 17, 1914, to Feb. 28, 1915. These deaths were due to the use of a cheap imitation of vodka. In the time mentioned, in successive periods of four weeks each, the number of deaths increased in the following proportions: 26, 33, 34, 43, 53, 58 and 66, showing that in the last period of four weeks the number of deaths was two and one-half times the number occurring in the first period. The rapid increase of the death rate from this cause was in direct proportion to the increased vigilance in the enforcement of the vodka edict, and the sale of the poisonous substitutes increased in the same proportion.

Although we are not mining coal in Russia, we may learn some valuable lessons from these data, which show the mistake of enforcing a wholesale prohibition measure without providing a wholesome substitute. We must recognize the fact that prohibition accomplishes only one-half of the necessary work. The saloon in a mining town supplies a two-fold want—it satisfies the craving for stimulants that is so strong in many and supplies a social element for others. The problem confronting temperance workers is how to fill the void and supply these needs when removing the saloon. It may be impossible to find a thoroughly wholesome substitute for liquor used as a stimulant. Strong coffee is often used.

The problem is not hopeless, however, in respect to the saloon as a social center. For this class a saloon provides a meeting place where congenial spirits discuss affairs of interest or enjoy a social game of cards or pool. The money spent in this way would go far toward the equipment of a club house where all of these and other pleasures could be enjoyed without the contaminating influences of the saloon. Such a club house could include a gymnasium and dance hall where suitable music could be provided.

The saloon makes itself attractive to its devotees. To counteract its influence, the miners' homes and surroundings should be made as attractive as possible. I am glad to say that the day of the common miner's shack is rapidly passing, and the attractively painted houses, grassy lawns and garden spots that have been developed largely as the result of the prizes offered by many coal companies for such improvements have taken their place.

Aside from home or club-house attractions, many miners can be interested in church work and social organizations. Many pastors in mining towns have been able, by different methods, to build up large Sunday School classes, sometimes inaugurating membership contests with classes in a neighboring town. In some places night schools flourish, which furnish to ambitious men the necessary means of improvement. This has proved a great advantage over home study, which always lacks the incentive that is necessary for the best results. In other places reading clubs and debating clubs have been formed, and these should always be encouraged.

There is sometimes a permanent amusement committee, charged with the duties of arranging public amusements of different kinds suited to the needs of the people. In this connection the younger sex are always interested in well-conducted dances, while the older men enjoy card games and other pastimes. Boys and men are always interested in baseball, football, running and jumping contests, etc. Good moving-picture shows are adapted to all and have proved very attractive. During the winter months amateur theatricals often elicit much interest and enthusiasm. Where there are a number of foreign-born people in the town, a play in their native costume and tongue could be staged with good effect. Folk songs and dances should be encouraged similar to the familiar "Bobby Burns." Every community should have its local band or officer, while choral clubs and good quartets always provide a source of profitable entertainment.

I offer these suggestions in the belief that they can be made an effective weapon in the fight against the saloon. In other words, the social life of the community can be made so pleasant and enjoyable that the saloon will sink into oblivion. No doubt some of the suggestions will not be applicable in some places, while others not mentioned here can be suggested to take their place. However, the general idea of providing pleasing and healthful surroundings can be carried out in every place.

Such efforts will unquestionably mold public opinion, which is the force that must be relied upon to drive out the saloons. Without favoring public opinion, prohibition laws cannot be passed or will not be enforced after they are enacted. At the present time public opinion in reference to prohibition is not a unit. There is too much leniency expressed because of a drinking father, husband or brother. Whenever the same condemnation is given to relatives or friends as to strangers, in respect to the drink habit, the liquor traffic will receive a serious blow.

In considering the suggestions I have offered, the question of expense can be disregarded, as the miners will generally be found willing to support such efforts when properly organized among themselves. I have seen successful chautauquas held in mining towns and cordial support given to Hungarian plays and Italian games. When properly conducted, each organization will become self-supporting and may in some cases become a source of revenue.

I have hesitated to refer to the financial aspect of this problem, believing that the more altruistic the motive, the more successful will be the result, but the increased efficiency of sober miners, the reduction of accidents and the more regular output of the mine as the result of these movements being started will certainly justify the hearty coöperation and support of both the company and its men. Employees who do not drink are of as great or greater importance to the coal-mine operators as to railroad companies. Few, if any, companies will fail to encourage and support efforts emanating among their employees and designed to make the community life more pleasant and bankrupt the saloon. The opportunity is ever present; what is needed is sympathetic and intelligent leadership.

⁂

Mining Laws and Legislation

Letter No. 8—I have read with interest I. C. Parfitt's last Letter No. 6, *Coal Age*, July 31, p. 183, and while it is not my purpose to continue the argument, as Mr. Parfitt evidently feels that he is right in his assertion that an assistant mine foreman cannot be held responsible for his act under the provisions of the bituminous mine law of Pennsylvania (1911), for the benefit of other readers I will draw his attention to the last section of art. 4 of the law, which he may have overlooked.

Mr. Parfitt states that I am giving my "opinion as to what the law should be," while he is trying "to show what the law actually is as it reads." I have read again carefully all the sections of art. 4, and it has strengthened my opinion that an assistant mine foreman is, as I said before, legally responsible for the district that he examines. I cannot but feel that Mr. Parfitt formed his conclusion before he had finished reading this article. The last section of the article (sec. 24) reads as follows:

> When assistant mine foremen are employed their duty shall be to assist the mine foreman in complying with the provisions of this act, and in the absence of the mine foreman, they shall perform the duties of the mine foreman and shall be liable to the same penalties as the mine foreman for any violation of this act.

If the reading of this section is not sufficiently conclusive, there is nothing I can say to make it clearer.

As to the responsibility of the mine foreman for any orders he may give his assistant, Mr. Parfitt considers this as applying only to specific orders or instructions, which is exactly the point. It is clear that no mine foreman would order a place that has been standing for several months to be again started until he has personally examined the same and is acquainted with its condition, so that he can safely assume the responsibility for giving orders to start the place.

In this connection I will refer to a case with which Mr. Parfit is acquainted and rehearse briefly an incident that he knows to be true.

At a certain mine a fatal accident occurred in a district in charge of an assistant mine foreman. One of the entries had been extended a short distance beyond the last breakthrough. A miner in attempting to push his car to the head of the entry was obliged to pass under an unprotected trolley wire. When pushing the car, his head came in contact with the wire and he was instantly killed. The assistant foreman was discharged as a result of the accident. Although the assistant foreman had only been employed in the mine a few days, he was promptly arrested for his alleged neglect in not protecting the wire. I do not remember how the affair was settled, but the mine foreman was not questioned in regard to the matter. At the same mine, another assistant foreman was promptly dismissed at the request of the mine inspector, because he had permitted the laying of a switch under an unprotected wire.

I fail to see the application of Mr. Parfitt's reference to a state assemblyman or Federal congressman being immune from arrest, but in answer to his question, "Why does a mine inspector make his recommendations to the mine foreman and not to the assistant foreman?" I will quote art. 19, sec. 13, which reads in part as follows:

> Upon the discovery of any violation of this act, or upon being informed of any violation of the act, he (mine inspector) shall institute proceedings against the person or persons at fault, under the provisions of sec. 2 of art. 26 of this act.

This reference shows again that the assistant mine foreman can be held legally responsibile for the results of his acts or negligence. Under this law the mine inspector can hold any man in the mine responsible for its violation. It is only natural that he should make his recommendation to the mine foreman as being the superior officer in charge underground, the assistant foreman being subject to the foreman's instructions. When assistant foreman, I have accompanied the mine inspector on his visits throughout my district of the mine, frequently though not always with the mine foreman, and in those cases the mine inspector did not fail to address his remarks to me personally when suggesting changes.

In closing permit me to say that I certainly do regard the mine foreman as being responsible for the kind of men he employs as his assistants, but nothing that I have said can be construed to imply that the mine foreman is responsible for the *official acts* of his assistants.

The Coal Age Pocket Book

The table on the preceding page is deduced from the determinations of atmospheric density and pressure, under normal conditions, at different elevations above and below sea level, as established by the celebrated British astronomer royal, Sir George Biddle Airy (1840), and the aëronautic observations of Herschel and Glaisher.

The **atmospheric pressures** in the third column of the table are the mean of many direct observations taken at different altitudes, under normal conditions, and constitute what are generally known as "Airy's tables."

The **temperatures** in the fourth column correspond to the mean observed temperatures, at different altitudes and are based on a sea-level temperature of 60 deg. F. They are suggestive of the rate of cooling or fall of temperature with respect to increase of altitude. The following table shows the mean observed temperatures of the atmosphere at different altitudes, the rate of fall (deg. per 1000 ft.) and the estimated average temperature of air columns from sea level to the altitudes given:

TABLE SHOWING RELATION OF MEAN TEMPERATURE TO ALTITUDE IN THE ATMOSPHERE

Altitude or Elevation Above Sea Level Ft.	Mean Observed Temperature Deg. F.	Rate of Fall in Temperature Deg. per 1000 Ft.	Mean Average Temperature of Air Column Deg. F.
25,000	0	1.6	24
20,000	8	1.8	29
15,000	17	2.0	35
10,000	27	2.5	42
8,000	32	3.0	45
5,000	41	3.5	50
3,000	48	4.0	54
0	60	..	..

The mean average temperature of air column extending from sea level to any altitude given in the above table makes it possible to calculate the normal barometric pressure for that altitude, by means of the following formula:

$$B_h = 29.925 \left[1 \pm \frac{1}{144\,(0.37\,T)}\right]^h$$

in which

B_h = barometric pressure, at altitude h (in.);
T = average absolute temperature of air column, sea level to altitude h (deg. F.);
h = altitude above sea level (ft.).

The application of this formula requires the use of a table of seven-place logarithms or more. It serves to check the temperature observations at these altitudes.

The sign ±, in the formula, relates to the altitude h as being above or below sea level. For altitudes above sea level, the second term within the brackets is negative and the minus (—) sign must be used. For altitudes below sea level, this term is positive and the plus (+) sign is employed.

Inquiries of General Interest

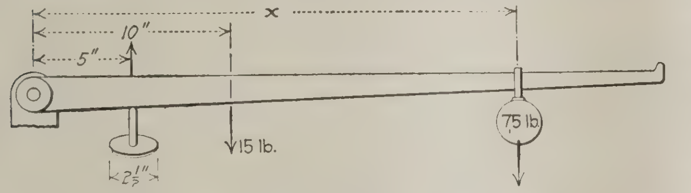
Safety-Valve Formulas

Some time ago there was answered in *Coal Age* a question relating to the lever safety valve, and the method of calculating the distance of the ball or weight from the fulcrum for any given blowoff pressure was explained. The formula took into account the center of gravity of the combined weight of the safety valve and the lever. Will you kindly give the formula for finding the distance of the ball from the fulcrum; also, the formula for finding the blowoff pressure when the weight of the ball and its distance from the fulcrum are known.

R. W. SPAULDING.

Buffalo, N. Y.

At the moment of blowoff there are three forces in equilibrium about the fulcrum as a center. The total steam pressure on the valve, acting upward, is resisted by the combined weights of the valve, lever and ball, acting downward. The moment of the upward steam pressure, with respect to the fulcrum as a center, is equal to the sum of the moments of the combined weight of valve and lever, acting downward through its center of gravity, and the weight of the ball also acting downward.



In the following formulas, let

x = Distance of ball from fulcrum (in.);
m = Distance from fulcrum to center of gravity of valve and lever (in.);
n = Distance from fulcrum to valve steam (in.);
W = Weight of ball (lb.);
w = Combined weight of valve and lever (lb.).

Then, to find the distance of the ball from fulcrum, for any given blowoff pressure:

$$x = \frac{apn - wm}{W} \qquad 1.$$

To find the blowoff pressure, for any given weight of ball and distance to fulcrum:

$$p = \frac{Wx + wm}{a\,n} \qquad 2.$$

To illustrate the use of the formulas, assume the following values as shown in the accompanying figure:

Let $m = 10$ in.; $n = 5$ in.; $w = 15$ lb.; $W = 75$ lb. Taking the diameter of the valve as 2.5 in., its area is $a = 0.7854 \times 2.5^2 = 4.9$ sq.in. Then, substituting these values in formula 1, we find the required distance from the fulcrum to the ball, for a blowoff pressure of 90 lb. per sq.in., is

$$x = \frac{4.9 \times 90 \times 5 - 15 \times 10}{75} = 27.4 \ in.$$

Again, to find the blowoff pressure when the ball is set at a distance of 20 in. from the fulcrum, we have

$$p = \frac{75 \times 20 + 15 \times 10}{4.9 \times 5} = 67.3 \ lb.$$

Anthracite Prices as Affected by Pennsylvania State Tax

Please state the circular price of anthracite, as of April, 1915, before the 50c. differential went into effect, at New York or tidewater, Boston and Buffalo, specifying the market sizes of egg, stove, nut and pea.

———, Penn. X.

In answer to the foregoing, it may be stated that the wholesale anthracite circular of Apr. 1, 1915, quoted egg and stove at $5.25 per gross ton delivered in barges, alongside Boston points, plus the Pennsylvania state tax, which in April amounted to 8c. per ton for these sizes of coal. The same circular gave the price of nut as $5.50, alongside, plus the state tax; and pea coal, as $4, alongside, plus the tax. In April, the Pennsylvania state tax on nut was 8.62c. and on pea 5.25c. per ton.

These are the net circular prices of such companies as the Philadelphia & Reading Coal & Iron Co. and the Lehigh & Wilkes-Barre Coal Co. Other companies, as Lehigh Valley Coal Sales Co.; Williams & Peters, representing the Hillside Coal & Iron Co. and other producers; Dixon & Eddy, representing the Scranton Coal Co., the Hudson Coal Co. and other shippers, all add 10c. flat to the above prices, to cover the Pennsylvania state tax. Unlike the first two companies named, they do not make a separate item of the tax as do those companies who assess their customers the same amount they pay to the state.

From the circular, the prices of egg, stove and nut advance 10c. each per month, for five months beginning May 1, so that the prices, Sept. 1 and following, are 50c. in advance of the circular prices quoted, except for pea coal, for which there is no such advance in price. While, according to the circular, the same advance applies to broken coal, it is customary to allow the April price to prevail throughout the year on this size.

The wholesale anthracite circular, April, 1915, at the lower ports of New York or tidewater, quotes the following prices: Broken, $5.05; egg, $5.30; stove, $5.30; and chestnut, $5.55 per ton. For delivery at the upper ports of New York, these prices are increased 5c. per ton to cover towing charges.

The prices for the smaller sizes of anthracite are as follows: Pea, $3.50; buckwheat No. 1, $2.75; buckwheat No. 2, $2.25; and buckwheat No. 3, $1.75, all f.o.b. The spring discount of 50c. per ton does not affect the prices of these smaller sizes of coal.

The wholesale anthracite circular, April, 1915, at Buffalo, quotes prices as follows: Grate, $5.60; egg or stove, $5.85; nut, $6.10; and pea, $4.05 per ton, f.o.b. cars.

Examination Questions

Miscellaneous Questions

(Answered by Request)

Ques.—A certain incline 1000 ft. long has a grade sufficient to accelerate the speed of a car so as to cause it to gain in velocity 1.25 ft. each second. (a) If the car starts from rest at the top of this plane, at what distance from the top will it have acquired a velocity of 40 ft. per sec.? (b) How long will it take the car to reach the bottom of the incline? (c) What will be its velocity when it arrives at the bottom of the plane?

Ans.—(a) Since the car gains 1.25 ft. in velocity each second, the acceleration is uniform and the time required to attain a velocity of 40 ft. per sec., assuming the car starts from rest, is 40 ÷ 1.25 = 32 sec. Since the acceleration is uniform, the space passed over in any given time when the car starts from rest will be the same as though it had traveled for the same time with a uniform velocity equal to one-half the velocity acquired at the end of that time, or in this case, ½ of 40, or 20 ft. per sec. Therefore the distance of the car from the top of the plane at the end of 32 sec., when it has acquired a velocity of 40 ft. per sec., is 20 × 32 = 640 ft.

(b) The time required for a car to pass over any given distance when starting from rest and moving with a uniform acceleration is found by dividing twice that distance by the acceleration and extracting the square root of the quotient obtained. Thus in this case the car will reach the bottom of the plane, a distance of 1000 ft., in 40 sec., which is found as follows:

$$t = \sqrt{\frac{2 \times 1000}{1.25}} = 40 \textit{ sec.}$$

(c) Since the gain in velocity is 1.25 ft. each second, the velocity of the car at the end of 40 sec., when it arrives at the foot of the incline, will be 40 × 1.25 = 50 ft. per sec.

Ques.—Find the acceleration due to a gravity plane when the weight of the descending loading cars is 7000 lb. and that of the ascending empty cars and rope 3600 lb., ignoring friction.

Ans.—In this case, ignoring friction, the force producing motion is the difference between the weight of the descending and ascending loads, while the total moving weight is the sum of these two loads. When a body falls freely, the force producing motion is equal to the weight of the body, and the acceleration is then 32.16 ft. per sec. But for the same mass moved, the acceleration produced is directly proportional to the force producing the motion. Hence, applying this principle in the present case, the ratio of the required acceleration to 32.16 is equal to the ratio of the difference between the descending and ascending loads to the sum of these loads, which gives for the required acceleration *f*,

$$f = \frac{7000 - 3600}{7000 + 3600} \times 32.16 = \frac{17}{53} \times 32.16$$
$$= 10.31 \textit{ ft. per sec.}$$

Ques.—Find the centrifugal force developed by the revolution of a body weighing 150 lb. when its speed of rotation is 120 r.p.m. and the radius of the circle described by its center of gravity is 10 ft.

Ans.—The centrifugal force of a revolving body is equal to twice its kinetic energy expressed in foot-pounds per second, divided by the radius of revolution in feet. In other words, the centrifugal force of a revolving body is found by multiplying the weight of the body in pounds by the square of its velocity in feet per second and dividing this product consecutively by the acceleration due to gravity (32.16 ft. per sec.) and the radius of revolution expressed in feet.

Thus in this case the velocity of the center of gravity of the body when making 120 r.p.m., or 2 r.p.s., is 2 (2 × 3.1416 × 10) = 125.66 ft. per sec. The centrifugal force of a body weighing 150 lb. and moving with this velocity is therefore

$$F = \frac{W v^2}{R g} = \frac{150 \times 125.66^2}{10 \times 32.16} = 7365 \textit{ lb.}$$

Ques.—What work is performed in hoisting a cage weighing 2600 lb. and carrying a loaded car that weighs 3400 lb., in a shaft 200 ft. deep, assuming that the friction of the hoist is one-tenth of the load hoisted and ignoring the weight of the rope?

Ans.—The total load hoisted is 2600 + 3400 = 6000 lb. Adding one-tenth for the friction of the hoist gives 6600 lb. The work performed when this weight is lifted 200 ft. is 200 × 6600 = 1,320,000 ft.-lb.

Ques.—Assuming that the track resistance on a certain haulage road is 40 lb. per ton, what horsepower of engine will be required to haul a trip of 15 mine cars on a level road in a mine at a speed of 10 mi. per hr.? Each car weighs 1800 lb. and carries 2400 lb. of coal. Assume the efficiency of the engine is 85 per cent., and ignore the weight and resistance of the haulage rope.

Ans.—The total moving load in this case is 15(1800 + 2400) = 63,000 lb., or 31.5 tons. The track resistance being 40 lb. per ton, the force required to move the loaded trip is 40 × 31.5 = 1260 lb. A speed of 10 mi. per hr. is 10 × 5280 ÷ 60 = 880 ft. per min. Then, assuming an efficiency of 85 per cent. for the engine, the horsepower required is

$$H = \frac{1260 \times 880}{0.85 \times 33{,}000} = 39.5, \textit{ say } 40 \textit{ hp.}$$

The resistance of the haulage rope, in mine haulage, is generally estimated from its weight as 40 or 50 lb. per ton.

Ques.—If rails cost $50.00 per ton, what would be the cost of the rails used in laying a single track of 16-lb. rails in an entry half a mile in length?

Ans.—A half-mile is 2640 ft. and will require 2 × 2640 ÷ 3 = 1760 yd. of rail. The weight of the rail used being 16 lb. per yd., the total weight required for this entry is 1760 × 16 ÷ 2000 = 14.08 tons, which will cost 14.08 × 50 = $704.

Coal and Coke News

Harrisburg, Penn.

Railroad men connected with the anthracite-carrying roads expressed disappointment with the decision of the Interstate Commerce Commission affecting rates of coal transportation. The decision is called unfair, unjust, and discriminating.

It appears from rough estimates, however, that the Delaware & Hudson R.R. will fare the worst. Nearly all of its coal goes to points north and northwest. The shipments do not reach tidewater. On a gross business of more than 9,000,000 tons it is estimated that the Delaware & Hudson, must lose from $2,000,000 to $3,000,000 under the new rate.

The Central R.R. of New Jersey and the Philadelphia & Reading will probably come next in the amount of loss incurred. All of the coal shipments are sent eastbound. There is a reduction of 5 cents on the rate to tidewater and of 15 cents to 35 cents to points like Elizabeth, N. J. It was estimated that the joint roads, with an anthracite shipment of 10,000,000 tons, would lose about $1,500,000 a year.

The Delaware, Lackawanna & Western will probably come next in line with a loss estimated at $1,000,000 a year.

It is probable that the Erie will also lose $1,000,000 under the new schedule. Down on the bottom of the list are the Pennsylvania and the Lehigh Valley railroads, which are expected to lose about $500,000 each. The Lehigh Valley's losses, it is thought by many, will be less than $500,000, though they have been estimated to be over $1,000,000. The Lehigh Valley is in a fortunate position, in that it ships its coal to the West for the main part, and therefore suffers the smallest reduction. Last year's anthracite shipments amounted to nearly 15,000,000 and the coal business of the road was about 56 per cent. of the total freight business.

The purpose of the Interstate Commerce Commission in ordering the reductions is to give the independent operators, who produce 20 per cent. of the total anthracite, a fair chance to compete with the railroad coal companies. If this competition becomes real and effective, the independents may be able to sell coal at a lower figure, and this reduction in the selling price of coal may react on the companies controlled by the roads.

Whether any of these results of the Federal Commission's decision will enable the ultimate consumer to buy coal at a lower rate is doubted. It is believed that most, if not all, of the reduction will be absorbed by the retail dealer. Consumers on a large scale, such as factories buying direct from the mines, may, however, be benefited to a noticeable degree.

While the decision in no way affects the Philadelphia situation, the men who have been active in supporting the fight of the State Public Service Commission in its effort to compel the roads to reduce their rates 40 cents a ton to Philadelphia are greatly pleased because they see a moral effect to result when the appeal of the railroads comes up before the Dauphin County Court on Sept. 15.

The decision of the Interstate Commerce Commission is final, according to attorneys who have studied the case. There can be no appeal, and the only hope the railroads have is in a possible rehearing before the commission. It is predicted that there will be no application for a rehearing by the railroads, at least not until the rates have been operative for some time. If it could be shown that the rates are confiscatory, an appeal to the courts might follow. If any of the roads might raise the question of confiscatory rates successfully it would be the New York, Ontario & Western and the Erie lines. These roads are described by the commission in its reference to incomes of the respondent roads as "less prosperous roads," with net incomes much lower than the net incomes of other anthracite carriers.

The consensus of opinion in the anthracite region is that the miners are in no wise afraid of the cut in the coal freight rates, because the commission of 1902 and 1903 passed upon their wages. The wage is not based on freight rates. The miners, believe, by reason of their organization, they are in a position to stand out against any reduction of wages. As the United States Courts have now virtually decreed that the coal companies must be divorced from the railroad companies, it would only complicate matters if they gave as an excuse for reducing wages the decree rendered for a reduction of freights, when the latter are not supposed to be a factor in the earnings of the coal producers.

Can Dredged Coal Be Taxed

While companies and firms engaged in handling culm or washing or dredging coal from the rivers have been filing reports with the Auditor General under the terms of the anthracite coal tax law, the point was raised on Aug. 13, by an attorney for a coal company that the coal washed or handled from banks or streams could not be taxed because there is no way of telling when it was mined. The question raised is that the act only taxes coal mined since the act went into effect.

Officials of the Auditor General's Department do not think that the point will hold and say that the act covers coal mined and prepared for market. Most of the coal dredging companies are filing reports just as are the big producers of anthracite. For the convenience of the companies having several collieries, a form of report giving summaries has been prepared.

The Railroads Are Storing Coal

All the big railroads, as well as a number of the smaller ones, are now storing coal against any contingency that may arise as a result of the heavy demand for export and the threatened shortage of labor due to return of thousands of foreign-born miners to their native lands.

For the past six months representatives of European and South American governments have been actively engaged in contracting for coal in the bituminous region. Many thousands of tons are being shipped to Baltimore, where it is loaded on ships for the continent and eleswhere.

Since July 1, the Pennsylvania R.R., the Baltimore & Ohio and the Bessemer & Lake Erie, the Buffalo, Rochester & Pittsburgh and the Pittsburgh & Lake Erie, have been accumulating a fairly large percentage of the coal mined. At all large coal storage stations of these companies hundreds of cars are arriving weekly, and the stocks at many points are beginning to assume large proportions.

That the question of labor is soon to be the biggest problem mines and other industries will have to face is evidenced on all sides. Quietly for the past six months many foreign-born miners and day laborers have departed from the western part of the state for eastern ports. The greater proportion of these men are returning to their countries to take service in the armies, but it is understood that many are also going home to work in mills and factories which are turning out supplies for their Governments.

The anthracite operators have not much fear that the war will have serious effect upon the supply of labor for their mines. Just now a good many Italians are going home, but this nationality only represents about 7 per cent. of the anthracite employees, and a large number of them are below the military age while many are now above it and many are citizens of this country. Further there is no large demand for the exportation of anthracite coal, and presumably the British order forbidding shipments of coal out of the country will not create nearly so great a demand for anthracite as for bituminous. A shortage of bituminous would naturally augment the demand for anthracite for home consumption, but these are contingencies that have not yet been given serious thought by many operators.

While the larger number of foreign employees in the coal regions of the state are from Austria-Hungary, comparatively few of these have returned to their countries owing to their inability to secure safe transportation.

PENNSYLVANIA

Anthracite

Lykens—On account of the continued slack business at the collieries of the Susquehanna Coal Co., in the Lykens Valley, more than 100 miners have quit and gone to Bethlehem where they have found employment with the Bethlehem Steel Co., which is working full time on war orders. The loss of so many men at the collieries handicaps their successful operation.

Plains—Two hundred workmen who have been on strike at the Hudson Colliery of the Central Coal Co., returned to work on Aug. 12, after officials promised them the increase in wages demanded. Forty men had gone out on strike in one of the workings, making a demand for an increase of 46 cents per day. The men made this demand on the ground of prevailing conditions and also that men in other veins were receiving that amount of pay. When the demands were refused the balance of the employees of the colliery went out in sympathy with the other strikers.

Mt. Carmel—A thousand employees of the Natalie Colliery, operated by the Maderia Hill Co., went on strike on Aug. 10, because the company announced a 10 per cent. reduction of wages in gangways and certain other work. The company says the reduction is necessary to keep the mines on a paying basis.

Fern Glen—When the employees of the Tomhicken colliery of the Hazle Mountain Coal Co. left that operation on Aug. 13, it marked its passing as an active factor in the production of anthracite coal. The men at that mine, on the 13th were informed that the no-work-tomorrow order held good until the end of time. The operation gave employment to several hundred men. During the present year, the final robbing has been in progress and the limit of production was finally reached. It is understood that the plant is to be dismantled and the equipment will be sold.

Hazleton—For the first time in 15 years the Black Creek storage plant of the Lehigh Valley Coal Sales Co. is being used. The placing of coal in that section was started on Aug. 10, when a huge train load of coal was dumped along the mountain side. The capacity of this storage plant is almost unlimited, placed as it is in an unsettled section, and presenting for use, if needed, the entire mountain side. Work has been slack during the summer, tonnage records have slumped and the company, in order to keep its equipment busy, has decided on this storage plant, it being the first time, as stated, for it to be resorted to in 15 years.

Pottsville—The dredging of coal from the Schuylkill River this summer has proceeded more extensively than ever. One firm at Glenworth, south of here, has so far this season taken 15,000 tons of coal from the river. The coal is mostly of the smaller sizes from Pea down, but the price which is obtained makes dredging profitable work.

Pittston—The value of oxygen helmets in fighting mine fires was demonstrated on Aug. 14, when a blaze that threatened extensive damage to the No. 6 colliery of the Pennsylvania Coal Co. was extinguished, without heavy loss, closing the mine only one day. The fire is believed to have been caused by a carelessly discarded match among timbers in a section of the Pittston vein where slushing was being done. The blaze spread rapidly and had a good start when discovered. A helmet gang of 10 men entered the workings and carried the line of hose right up to the blaze, extinguishing it after several hours' work. General Manager Inglis directed the fire-fighting.

Port Griffith—With the concrete foundations and coal pockets completed, the steel superstructure of the New Ewen breaker of the Pennsylvania Coal Co., at Port Griffith, replacing the breaker destroyed by fire last January, is being erected and the "model" breaker will be finished by Jan. 1, 1916. Every piece of machinery in the plant will be electrically driven, marking another step in the Pennsylvania company's plan to electrify its entire system.

Scranton—Work on driving a bore hole some 250 ft. deep into the workings of the Peoples Coal Co. was recently begun. As soon as this bore hole is completed, the city, through the Department of Public Works, will begin flushing the worked out areas with ashes, clay and similar material. Ten to 12 tons of material per hour will be passed through the bore hole and nearly six city blocks will be thus supported.

Bituminous

Charleroi—Hazelkirk mine No. 2 of the Pittsburgh-Westmoreland Coal Co. recently resumed operation after a suspension of several weeks. The Dunkirk mine of the same company was also started shortly afterward. Both of these mines have been put in shape for a long and steady run, as heavy orders have been received.

Charleroi—The Ellsworth teams took first place in the open and closed first aid events at the miners' first aid demonstration of western Pennsylvania at Eldora Park recently. Ellsworth No. 1 team made a perfect score in the open event while in the closed event the Ellsworth No. 2 team did nearly as well, getting a percentage of 99. The rank of the teams contesting were as follows: Open event, first Ellsworth No. 1, second Gallatin No. 3, third Vesta No. 4 team. In the closed event the winning teams ranked as follows: First Ellsworth No. 2, second Toms Run, third Gallatin No. 3. Between 4000 and 5000 miners and their families witnessed the first aid contests.

Greensburg—Increased demand for coal for export and unusually large orders from the Northwest are causing considerable work in the Youghiogheny Valley. The Darr Mine at Jacobs Creek, belonging to the Pittsburgh Coal Co., is being put in shape for operation. Between 400 and 500 men will be employed at this mine which has been idle for the greater part of the year.

Banning—The No. 3 mine of the Pittsburgh Coal Co., which has been closed down for over a year, will shortly begin operation. The tipple has been overhauled and the entire mine made ready for a resumption of work.

McClellandtown—Under the supervision of James H. Hoover, the 120 beehive ovens upon which work during the past few months has been in progress, will probably be completed some time next month. Construction of these ovens was begun some years ago, was delayed from time to time but will be pushed from now on. Seventy-four ovens of the type of those being built are now in operation.

Uniontown—The rumor is current that the Stewart coke works of the Stewart Iron Co. is to resume operation. This rumor has been denied. Improvements have been made to the tenement houses during the past few weeks but operations are said not to be under contemplation. These works have been idle for over a year.

Roscoe—Operations were recently resumed at the Eclipse mine of the Pittsburgh Coal Co., 400 men being employed. A new steel tipple was put into use. The mine is one of the largest in the Roscoe section.

WEST VIRGINIA

Fairmont—It was recently announced that every mine of the Consolidation Coal Co. in commission this year is in full operation, and furthermore that sufficient orders are in evidence to keep these plants going full time for at least four months. Coal operators throughout the entire local field are decidedly optimistic.

Putney—The mines of the Campbells Creek Coal Co. have closed down for an indefinite period. About 300 miners and mine laborers are affected by the suspension of these operations.

Williamson—A marked demand for a high-grade domestic coal during the past 12 months has led operators into investing nearly $2,000,000 in improvements and developments of coal mines in the Thacker section. Several new mines are now producing high-grade domestic and steam coals. An electric power plant has also been constructed by the Crystal Block Coal Co., which will furnish current to many of the towns and mines along Tug River.

ALABAMA

Birmingham—Taking advantage of the increased rail rate to New Orleans, the river mines of Alabama are planning to make huge improvements, with the view of supplying New Orleans with river coal at a much lower figure than can the rail business. The Pratt Consolidated Coal Co. and the Alabama & New Orleans Transportation Co. already have fleets of steel barges plying between New Orleans, Mobile and the mines, and have many additional barges under construction. It is announced that the Tennessee Coal, Iron & R.R. Co. has closed a contract with the Alabama & New Orleans Transportation Co. to barge coal to New Orleans, approximating 10,000 tons per month, which coal will be loaded at the Maxine mines. Many smaller mines are opening up along the river.

Tuscaloosa—The Gilmore mines on the Warrior River near Tuscaloosa will resume operations shortly after being suspended several months. The output will be sent to Mobile and New Orleans to be used on ocean-going vessels.

KENTUCKY

Louisville—Bondholders of the Continental Coal Corporation operating mines in southeastern Kentucky, have until Aug. 25 in which to file their consents to the proposed trust agreement by which interest on the company's bonds will be reduced from 6 to 3 per cent. for the next two years. It is understood that the Louisville Trust Co., with which the trust agreement has been filed, has received consents from bondholders whose holdings aggregate $1,400,000, while the needed amount to be represented is said to be $1,650,000 or 80 per cent. of the total outstanding issue. The date named is an extension from Aug. 10.

Lexington—C. J. Norwood, state inspector of mines, and dean of the college of Mines and Metallurgy at the State University, has issued announcements of a series of examinations for mine foreman's and fire boss' certificates, which will be held here on Aug. 23. To be admitted to the examinations it is necessary to pay a fee of $2.50 to the State Auditor at Frankfort.

Typo—The Harvey Coal Co. with offices at Knoxville, Tenn. has started coal mining in the new mines on First Creek and will be ready to begin shipping coal within the next 30 days when the new First Creek Branch railroad is ready for traffic. Track laying has been going on for some time.

Hazard—The Lexington & Eastern R.R. states that coal shipments are rapidly increasing in the Hazard field, and that more coal is now going out over the L. & E. than at any other time in the history of the development of the territory. The road is being taxed to handle the heavy shipments. It will be necessary to add a number of new trains.

OHIO

Glouster—The letting of the contract of the Ohio State University at Athens to a West Virginia concern has occasioned much criticism here, as this fuel has been furnished for some time by the Bailey Run mine, near Jacksonville. The contract was let this year on a strictly competitive basis, and went to West Virginia in consequence.

Athens—Repair work has been started on mine No. 254 at Jacksonville, near here, with a view to placing it back in operation, after a lapse of a considerable time. The work will cost several hundred dollars, and it is expected that the mine will be producing within a short time.

Amsterdam—Employees of Mine No. 2 of the Ohio & Pennsylvania Coal Co. have been notified that the mine would be placed in full operation soon. In the past few weeks the mine has been operated several days weekly.

Blaine—The strike at the Blaine mine of the Lorain Coal & Dock Co., which affected about 400 miners, has been settled and the men have returned to work. The men walked out because their demand for two check weighmen was refused by the operating company. The company will try to enforce the fine of $1 per day per man, contained in the wage scale which was recently agreed to.

INDIANA

Sullivan—The J. Woolley Coal Co., Evansville, has leased the Midland mine near here and will begin operations Sept. 1. The Cloverleaf mine will also resume operations. Superior mine, No. 10, has increased its working force.

Boonville—The Indiana Workmen's Compensation law goes into effect Sept. 1. The Big Four Coal Co., which has a mine near here, has posted notices that it will not operate under the law but will stand upon its rights in court.

ILLINOIS

Shiloh—Four mules belonging to the Southern Coal and Mining Co., after surviving for years the perils of life underground in the Shiloh mine of the company, were killed by lightning the day after they were raised to the surface. The mules were no longer needed underground and were hoisted and turned into a pasture. The next day there was a violent storm and a tree under which the animals had taken shelter was struck and all four were killed.

Springfield—A tentative plan for the distribution of the $26,000 appropriated by the general assembly for the relief of the families of miners killed in the Royalton mine disaster, Oct. 27, 1914, has been worked out by the State Board of Administration. The money, with the exception of $1000 to defray the expenses of administration, will be prorated among the survivors. Fifty-five families will be beneficiaries. These include 80 children. Allotments will be made to one miner who was injured and to two who went insane as a result of the disaster. Each widow will receive $15 a month as long as the fund lasts. For each child under 14 years of age she will receive $5 a month. Orphans will receive the same amount as would be paid the family were the mother living. It is estimated that under this system the money will last about two years. The largest amount will be paid to Mrs. Mary Smiddie. She has 9 children, of whom 6 are under 14 years of age. She would receive $45 a month. The plan is the same as was adopted in disbursing the Cherry Mine relief fund.

Belleville — A foreclosure suit was filed in the Circuit Court here recently against the Vulcan Coal & Mining Co., William Winkelman, P. J. Gundlach and E. F. Ackerman, administrator of the estate of the late Jacob Gundlach. The proceeding is brought by the Belleville Bank & Trust Co. and George Hippard, president of the Hippard Coal Co. A foreclosure order on the property of the Vulcan company is asked under a $50,000 mortgage and various notes signed by the Vulcan company and the other defendants and held by the plaintiffs.

Winkle—Nine men have been arrested in connection with an alleged attempt to blow up with dynamite the mine of the Granger Coal Co. and it is expected that three other men will be arrested. Discovery of the alleged plot was made Aug. 13. Sheriff J. Quinn, of Charleston received information from a negro that the tipple and surface property of the mining company was to be destroyed. Eighty sticks of dynamite were found hidden in a shaft. The Granger mine has been the scene of trouble several times since last February. It has arisen out of the attempt of the Granger company and a faction of miners to operate the mine on a coöperative basis. Another faction of unionists has opposed this effort. The mine was formerly known as the old Chime mine. Last February a coöperative company was formed by 150 men and the mine was worked on a coöperative basis for some time. Then there was a disagreement and the Granger company was organized. The pump house and fan house were recently destroyed by fire of unexplained origin.

Carlinville—A decision of great importance to coal men was handed down here Saturday, Aug. 14, by Judge Frank Burton in the Macoupin County Circuit Court in the case of the Superior Coal Co. against the Ohio Oil Co., the Louis H. Miller Oil and Gas Co. and G. P. Fleegler and others, involving the question whether oil and gas companies have the right to bore through coal beds. The decision is that work may be continued on wells that have been begun by the defendant companies but that new wells may be bored on lands of the Superior Coal Co. only on condition that they will not be nearer than 900 ft. to coal workings, shall not be closer than 600 ft. to each other and not more than three wells shall be bored on each 40-acre tract. Five days' notice must be given the coal company of the location of new wells. Except as to these provisions the temporary injunction obtained by the coal company two weeks ago is dissolved. As to these provisions the injunction is only suspended and may be invoked if any of the conditions are violated. The Superior Coal Co. has leases on 44,000 acres of coal around Staunton and Dorchester, Ill. Recently oil and gas were discovered in the vicinity and a boom developed. The company saw in the sinking of many wells a source of damage and danger and appealed to the courts for relief. The question had never been raised in Illinois before and attracted a great deal of attention. The decision is not entirely pleasing to either side and it is probable that the question at issue will be carried to the highest courts. In the meantime the decision of Judge Burton will govern operations on the Superior Coal Co.'s lands.

COLORADO

Golden—At the suggestion of the newly appointed president of the Colorado School of Mines, Dr. William B. Phillips, the board of trustees has formally created the chair of "safety and efficiency engineering." It is planned to give instruction that will assure the utmost safety in coal as well as metal mining.

Hastings—The Victor-American Fuel Co. has recently put all its coke ovens into service for the first time in over a year.

PERSONALS

Charles S. Kehler, formerly with the Puritan Coal Co., will on and after Sept. 1 represent as sales agent C. C. Corey of Detroit. H. H. Le Bel will also be a sales agent for the same firm.

E. W. Coates, formerly Indiana representative of the Peacock Coal Co., of Columbus has been assigned to cover central Ohio territory. His place in Indiana has been taken by H. W. Fitzgerald.

Thomas H. Stoneham, of Boston Hills, for several years division inside foreman of the Delaware & Hudson Coal Co., has been advanced to the position of general superintendent of the Plymouth district.

Hugh D. Pallister has resigned as assistant professor of mining at the Pennsylvania State College to accept the position of professor of geology and mining at the School of Mines of the University of Texas.

T. B. Shockley, for some time Superintendent of the Oklahoma Coal Co., will on Sept. 1 next become General Superintendent of all the mines for the Oklahoma Consolidated Coal Co. This firm will be one of the largest operating concerns in the Southwest.

V. C. Hillabold has purchased an interest in the Madison Coal Co. which was recently taken over by a syndicate operating a number of coal companies along the Ohio River. Mr. Hillabold will succeed Frank Vawter at the local office while Mr. Vawter will take another post with the company.

W. E. Thomas, cashier of the Bridgeport Bank & Trust Co., has been appointed Referee in Bankruptcy for Belmont County for the Fort Pitt Coal Co., which was recently forced into involuntary bankruptcy. Mr. Thomas expects to take no immediate action looking to the disposition of the property.

T. Coleman du Pont, who recently disposed of his interests in the du Pont de Nemours Powder Co., was a recent visitor in Louisville, Ky., which was his home for many years. He also went on to Central City where he inspected the properties of the Central Coal & Iron Co. in which he is still interested.

Secretary B. F. Nigh of the Michigan-Ohio-Indiana Coal Association recently returned from a speaking trip which took him to Vincennes, Richmond and Indianapolis, Ind. During his two weeks traveling he has taken more than 30 new members into the organization and finds the interest is increasing in association activities.

W. R. Fairley, representing the federal government and who was sent to Kansas to probe the labor situation in the mining district there and find the reason why 1200 miners were without work is now investigating the case of the Sheridan Coal and Mining Co. as a side issue and he will probably send a report to his department on this case. He has not yet visited the strip pits, which are said to be the cause of the miners being without work, but, will do so soon.

OBITUARY

J. C. Boyle, president of the J. C. Boyle & Son Coal Co., Sparta, Ill., died at his home at Sparta, Tuesday, Aug. 10, at the age of 85 years. Entering the mining industry late in life, after his fortune, built up as a member of the banking firm of Borders & Boyle, had been wiped out, he became one of the leading coal operators of his section. It was in 1884 that the bank failed. In 1887 Mr. Boyle sunk a small shaft near Sparta. He did not have money enough to equip the mine and at first he hoisted coal with an old blind horse. He obtained business in the neighborhood and from Sparta and in a short time was able to buy a team of mules, with which he delivered coal in person to the people of Sparta. In the course of a few years he was able to equip the mine with engine, boiler and hoisting apparatus. By building a macadamized road from the mine to the city limits he was able to practically control the coal business of the city. He was successful and leaves a well-equipped mine which, since his retirement, has been conducted by his son, who will continue to operate it.

INDUSTRIAL NEWS

Baltimore, Md.—The purchase of land in the northern section of Baltimore has led to the rumor that the Baltimore & Ohio R.R. plans laying out a large coal storage plant at that point.

Lorain, Ohio—Thirty-one thousand, one hundred and eighty-nine tons of coal were recently loaded into vessels over the dock of the Baltimore & Ohio R.R. at Lorain. This is believed to be a record for the Great Lakes of tonnage handled by one machine.

Philadelphia, Penn.—The Swedish steamship "Norbotten" left here recently with one of the largest cargoes of bituminous coal that ever left for a foreign port. She carried a tonnage of 8434 tons, which was valued at $22,382.40, and was destined for Stockholm.

Knoxville, Tenn.—A miners' annual field day first-aid meet will be held Saturday, Sept. 18, at Coal Creek, under the auspices of the Tennessee Mine Foremen's Association. The teams are being coached by J. M. Webb, officer in charge of the local mine rescue station. Over 37 teams are expected to enter the contest.

Philadelphia, Penn.—The coal shortage in France is becoming more apparent since British exports are to be shut off, as is indicated by increasing inquiries to local shippers. It is reported that of the 89 coal mines in France all but 9 are in the control of the Germans, and coal in France has already reached a price of $25 per ton.

Huntington, W. Va.—It is stated that the deal by which the Main Island Creek Coal Co. was to be taken over by the interests which control the United States Coal & Oil Co. has not yet been consummated, but that the outcome of the pending negotiations may be expected within a short time. Option on the company's property has been extended.

St. Louis, Mo.—J. E. Rutledge, of St. Louis, president of the New Staunton Coal Co., and the Nokomis Coal Co., has awarded a contract to the Roberts & Schaefer Co., of Chicago, for the designing and building of two miners' bath houses of hollow tile construction 70x24 ft. complete with the bath water heating equipment, lockers, showers, etc., which will be built immediately at these companies' mines at Nokomis, and Livingston, Illinois.

Minneapolis, Minn.—Preparations for starting the new plant of the United States Steel Corporation at Minneapolis in September are well under way. Coal has been shipped to the plant and the byproduct ovens have been fired with a view to thoroughly drying out their linings prior to the manufacture of coke. Cargoes of limestone and coal have been started from lower Lake ports and are now on their way to Duluth. It is expected that the plant will be in operation early in September.

Washington, D. C.—Officials of practically all the bituminous coal-carrying roads joined with many operators in a statement filed with the Interstate Commerce Commission recently, asking the Commission to fix the differentials between the various rates on soft coal from Ohio, Indiana, Kentucky and West Virginia mines to the Great Lakes. The Commission will take up this request this fall. The roads and operators are pledged to abide by the decision of the commission which is asked to fix the differences so all the roads may reach common points of consumption on a fair and equitable basis.

Trenton, N. J.—Judges Buffiington and McPherson have filed with the clerk of the United States District Court the recent decision of the United States Supreme Court enforcing the separation of the Delaware, Lackawanna & Western Coal Co. from the Delaware, Lackawanna & Western R.R. This filing of the decision is a legal formality that becomes necessary because of the fact that the decision of the Supreme Court was based on appeal from the decision of the court of this district and which the Supreme Court reversed. As a matter of fact the separation of the companies had taken place some weeks before the filing of the decree.

Louisville, Ky.—Local operators who have been advised that the Interstate Commerce Commission has upheld the proposed increase in rail rates from mines and coke ovens in Alabama, Illinois, Kentucky and Tennessee to Mississippi river crossings and various junction points in Tennessee, Mississippi and Lousiana, are of course disappointed. They had hoped that the commission would not allow the increase. It is stated that at least some of the western Kentucky operators feel that they will be at a disadvantage on account of the advance, which they opposed as well as Memphis and other valley town business interests. The river coal operators, however, are said to feel that they have gained a real advantage.

Donaldsonville, La.—The West Kentucky Coal Co.'s towboat "Gleaner," the third largest towboat on the Mississippi River, recently created a record when it brought a tow of 35 barges of coal to Donaldsonville, having made the trip from Paducah, Kentucky, in 8 days 3 hr. The tug recently was purchased by the West Kentucky Coal Co. for service in the harbor at Memphis. In the 40-day interval between the arrival of the "Gleaner" at this port on her last trip down the river, 31 barges of coal were unloaded at the Port Barrow station to fill orders booked by R. N. Sims, state manager of the company. The number of loaded barges now on hand is the largest that ever has been assembled in a local fleet, and perhaps the largest on the Mississippi between Memphis and New Orleans.

Philadelphia, Penn.—A number of interesting facts may be gleaned from the annual report of the Lehigh Valley Coal Co. for the fiscal year ending June 30, 1915: Production of anthracite lands owned and leased, including tenants, was 8,088,901 tons, an increase of 211,511 tons. The increase was all in the first six months of the fiscal year; the second six months shows a decrease. The percentages of sizes larger than Pea produced by the mining operations of the company was 65.41 per cent., a decrease of 1.05 per cent. A complete spray system was introduced at each of the frame breakers and as a result of tests made under observation of representatives of insurance companies, a substantial reduction was made in premiums paid for insurance. Included in the cash on hand is the sum of $678,085, representing the amount set aside on account of the special tax levied by the State of Pennsylvania of 2½ per cent. of the value of the coal mined, which amount is being held pending the decision of the courts as to the legality of the act. The working hours for the year were 42,085, an increase of 867 hours.

Coal Trade Reviews

General Review

Readjustment in anthracite freights creates uncertainties in the trade. Indications of a firmer tone in bituminous. Negotiations on permanent contracts in Europe. Lake trade fails to make any improvement. Middle Western consumers showing some interest in contracts.

Anthracite—All attention in anthracite circles is concentrated upon the new rate decision and its probable effect upon the trade. At the moment it has created a hesitancy throughout the market; orders are being held up in all directions pending a thorough analysis of the decision and as a result the current business has relapsed into probably the dullest stage of the summer trade. Although shippers aggressively deny the rumors of low prices, well informed buyers are making no pretense whatever of paying more than the April circular, with the possible exception of on some special coals.

General idleness prevails throughout the retail trade, and indications point to aggressive competition when the fall business opens up.

Eastern Bituminous—The trade is apparently steadying up, probably in anticipation of the impending fall business; there is less tendency to cut prices while operators are more resolute in restricting shipments. The improvement is confined more particularly to the steam grades which are acting in sympathy with the better outlook in manufacturing circles, where a great deal is anticipated by fall. Blocks of cheaper coal are occasionally noted on demurrage though these are usually moved without any severe cutting. What consumers have failed to close so far, continue holding out for special inducements.

Exports—Heavy orders continue coming in, in spite of almost prohibitive freight rates and a scarcity of bottoms. It is possible that there is even enough of this off-shore business now in sight to justify the opinion that the Atlantic coastwise market will be sustained at the present level, at least. American representatives in foreign countries are said to be making rapid headway in negotiations on permanent contracts, while inquiries on this side are coming through such responsible intermediaries as to leave little doubt as to the authenticity of the business. The movement over the Hampton Roads piers has been lighter during the past week, but there is a great deal of vessel tonnage due that will clean up the accumulation.

Lake Markets—Both the Lake and general manufacturing demand in the Pittsburgh district show a slight increase and mine operations are at a trifle better rate, while indications point to an improved demand although it will probably be slow. Urgent solicitation is necesssary to shake out orders and buyers are still cautious, but there are probably less reports of coal on demurrage. The market is a shade firmer and operators are stiffer in their views as to contracts running to Apr. 1. The Connellsville district continues moving a relatively large tonnage to the seaboard for export. The Canadian trade remains flat and shows no indications of reviving. The heavy rains and consequent curtailment in buying through the rural districts have again slowed up domestic buying in Ohio.

Middle Western—Negotiations on future business are showing some activity, especially from the Northwest, but orders have slowed up since the increased circular went into effect on the first of the month, most dealers having apparently met their current requirements on the July basis. It is apparent that many buyers have been holding off in anticipation of still lower prices, but the market is holding in a most impresssive manner, considering the general scarcity of orders. The recent light operations in the mining districts have caused a heavy exodus of miners and in event of the expected rush for coal materializing this fall, the operators are facing a possible shortage of men. Crops are delayed and have not yet become much of a factor in the situation.

A Year Ago—Business uncertainties have created a sharp buying movement in anthracite. The derangement in coastwise and foreign shipping has seriously disturbed the Eastern bituminous situation. Sales agencies aggressively investigating the possibilities in the foreign markets. Sentiment generally better.

BUSINESS OPINIONS

Boston News Bureau—Banking opinion continues to be focussed solely on the international exchange situation. The low market price of the British sovereign is checking business between the American and foreign merchants. To get this regulated is the need of the hour. Great Britain must have our products and it requires credit. At the moment the United States dollar is the standard and it must be so recognized. When we look at our economic position we are bewildered at our strength. We are not only burdened with money but are facing an enormous addition to our wealth from the soil. It is a waiting proposition, waiting for the consummation of the English loan.

American Wool and Cotton Reporter—The wool market for the last week was active, with scoured wool especially in demand. This was brought about by big army orders. In fact, there was a good general demand for all wool. The wool situation is stronger than for two years. Practically all offerings in woolen and worsted goods are available in the men's wear market, and the situation is favorable. The past week is considered one of the busiest at any opening period in a number of years. There is every indication of a prosperous season.

Iron Age—There is no let-up in the new inquiry for steel for the warring countries, and with each week the percentage of mill output that will be shipped abroad in some form is increasing. The evidence that this export business will continue for months on the present or a greater scale counts largely in the predictions of further broadening of the industry. Russia's Bessemer rail purchases are large and more are to come. The Steel Corporation now has 65,000 tons of this business, which will be rolled at the rate of 1000 tons a day at Chicago, and is more than welcome in giving employment to bessemer capacity in all the rush for open-hearth steel.

The Southern Lumberman—Basic conditions in the yellow pine industry continue to show improvement. Price advances shown in lists issued Aug. 1 are generally holding. There is no disposition on the part of the mills to force stock on the market; as a matter of fact, surplus stocks in first hands are not large enough to warrant sacrifices even where quick sales and in large amounts can be effected. A steady and fairly satisfactory summer business is being done in hardwoods. Buying continues to be in small lots, but is of very good volume in the aggregate.

Dun—Overshadowing several significant developments of the week the Government crop report is the strongest single factor operating for sustained business progress. Practical assurance of agricultural success was the one thing needed to make the future secure, and important undertakings will be prosecuted with increased vigor now that bountiful harvests are officially promised. Prosperous conditions on the farms are essential to national welfare.

Bradstreet—Enlarged house trade, country-wide optimism, smarter activity in metal manufacturing, further slight improvement in lines that have long lagged, heavier buying of pig iron at advanced prices, relatively excellent crop news, war orders that overflow regular channels to plants not heretofore engaged in that respect, better collections, increased calls for money with which to move crops, some, though not satisfactory, relief in the way of higher freight rates for Western railroads, a heavy influx of gold to help bolster weak rates for foreign exchange, which are at new record low levels, and sustained public interest in the stock market, comprehend the chief features of the week's developments.

Marshall Field & Co.—Although there have been fewer merchants in the market than a year ago, reports from those in indicate an optimistic feeling for excellent retail business this fall. Current wholesale distribution of dry goods has not been as satisfactory as that of the corresponding week a year ago, due in a large measure to adverse weather conditions throughout the country. Collections continue satisfactory.

ATLANTIC SEABOARD

BOSTON

Fewer concessions reported on Pocahontas and New River, and market is a trifle firmer. Slight demand for Pennsylvania grades and Georges Creek is in fair request. Water freights unchanged. Anthracite rather dull until September.

Bituminous—While there are no striking developments in the Pocahontas and New River trade it is plain there is less inclination to shade prices f.o.b. and the market as a whole is that much improved. Shipments to New England have not increased any and neither has the demand, but there is a little bracing up among the agencies as if to be in better position for fall business. Export orders are holding out fairly well and operators show a rather more resolute attitude about keeping output down to what the market will absorb.

On new business trade is at a standstill. The few buyers who have not yet placed contracts are still holding out for inducements. There is enough off-shore business in sight, however, at least to sustain the present price level, and if any notable bargains are had it will probably be on grades outside of Pocahontas and New River. Most shippers of the latter coals are doing a comprehensive business, even though New England is not contributing a very heavy share of it.

The Georges Creek shippers continue to send large tonnages off-shore, and the outlook is equally good for September. The demand here is so light, however, for spot coal that the occasional cargo that is not to be applied to contract is hard to sell. The Pennsylvania grades, especially those best known, are securing some new business here from time to time. Prices are as low as in any recent season and where the Hampton Roads shippers are more or less rigid as to price there is frequently an opening for small gains in tonnage.

Water Freights are quiet, with no special change in quotations. There is always a supply of bottoms particularly on the part of shippers with tonnage under charter which they cannot use themselves. Barges are freely quoted at 40c., New York to Long Island Sound ports. It is beginning to be felt that some of the sailing vessels now off-shore will be back in the coastwise trade by November and if that is the case they will have a tendency to keep freights on about the present range. The Philadelphia & Reading Transportation Line lost the barge "Knickerbocker" in the storm the week beginning Aug. 8.

Anthracite—Trade is waiting for stocks to move to the consumer. When that movement is on in earnest, in September, there will be a fair amount of business. There are predictions of an active fall market and the publication of the demands of the mine-workers is already causing retailers to consider the possibilities for next April. A few are quite strong in their disposition to take coal on this fall as fast as they make room.

Bituminous prices at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$0.85@1.40	$1.15@1.60	$1.67@1.77	
Philadelphia*	2.10@2.65	2.40@2.85	2.92@3.02	
New York*	2.40@2.95	2.70@3.15	3.22@3.32	
Baltimore*	....	....	2.85@2.95	
Hampton Roads*	....	....	....	$2.70@2.85
Boston†	....	....	....	3.55@3.68
Providence†	....	....	....	3.45@3.68

* F.o.b. †On cars.

NEW YORK

Interest of anthracite agencies centered on the possible effects of the rate decision, and negotiations delayed. Offshore business the only active branch of the bituminous trade. Some companies making permanent foreign connections.

Anthracite—The chief topic of conversation in anthracite circles this week is the decision of the Interstate Commerce Commission and the effect it will have on the trade generally. That the decision in some of its salient points is unfair seems to be the concensus of opinion. President L. F. Loree, of the Delaware & Hudson Co., stated that according to the terms of the decision his company will be affected more seriously than any of the other coal-carrying railroads. The action of the stock market alone on Friday morning was indicative of the public's interest in the matter.

Locally, shippers believe that the decision will cause continued dullness through September. They argue that consumers will await the results of the new order, anticipating a benefit, and that September tonnage will suffer accordingly.

Tidewater shipments have been light during the week. Very little coal is being brought down excepting on firm orders. The few purchases made by the retailers are limited largely to egg and stove in the domestic sizes and rice and barley in the steam grades. There seems to be no demand for chestnut while pea sales are very seldom noted. Buckwheat and the smaller sizes are moving freely on regular contracts and the individuals with high grade coals are obtaining good prices on them.

Each day or so brings new inquiries for export. Several samples have been dispatched and the prospective purchasers after making tests and deciding upon the correct size will probably place their orders. Most of the inquiries are for chestnut.

The average quotations of the week follow:

	Lower Ports		Upper Ports	
	Circular	Individual	Circular	Individual
Broken	$4.95		$5.00	
Egg	5.20@4.70	$4.90@5.20	5.25	$5.00@5.25
Stove	5.20	5 00@5.20	5.25	5.00@5.25
Chestnut	5.45	4 85@5.45	5.50	5.10@5.50
Pea	3.50	2.90@3 15	3.50	2.75@3.00
Buckwheat	2.75	2.00@2 25	2.80	2.05@2.30
Rice	2.25	1.70@1.85	2.30	1.75@1.90
Barley	1.75	1.45@1.70	1.80	1.50@1.75

Bituminous—There is not so much coal at the piers, the operators preferring to restrict operations at the mines and bring the coal down to Tidewater as business requires. It is true that blocks of some of the cheaper grades are standing from time to time but efforts to move this tonnage usually meets with success when shipper and consumer get together. Concessions of from 5 to 15c. are the medium through which this is accomplished.

Freights to Continental, Mediterranean and Northern ports continue to rise if anything as time goes on and when foreign consumers require the fuel they will pay the price. Even so it cannot be said that there is much hesitancy about the purchase after the inquiry falls into the shippers' hands. Rates to Italian and other Eastern Mediterranean ports for instance have advanced to 40 and 45 shillings, but bottoms are scarce. Available vessels of 2500 to 7500 tons' capacity are quickly chartered at the prevailing rates. Where sales of 3000 tons or less are made and no vessel of less than 4000 tons is obtainable the order is usually cabled back to proceed on that basis so that shippers have benefited in this way.

It is said that the representatives of several well-known concerns now in European countries have done well toward pushing American coal and have established connections which may lead to permanent relations.

Current quotations are on the following basis:

	South Amboy	Port Reading	St. George	Mine Price
Georges Creek Big Vein	$3.20@3.30	$3.20@3.30	$3.20@3.30	$1.75@1.85
Georges Creek Tyson	2.90@3.00	2.90@3.00	2.90@3.00	1.35@1.45
Clearfield:				
Medium	2.65@2.80	2.55@2.65	....	1.10@1.25
Ordinary	2.55@2.60	2.55@2.60	....	1.00@1.10
Broad Top Mountain	....	....	....	1.10@1.45
Cambria County:				
South Forks	2.90@3.05	....	....	1.35@1.50
Nanty Glo	2.75@2.80	....	....	1.20@1.25
Barnesboro	2.65@2.70	....	....	1.10@1.15
Somerset County:				
Quemahoning	....	2.70@2.85	2.70@2.85	1.20@1.30

Steam	....	2.45@2.50	2.45@2.50	.90@ .95
Western Maryland	....	2.35@2.40	2.35@2.40	.80@ .85

PHILADELPHIA

Anthracite very dull, with low prices the rule. Stove most active, with little demand for any other sizes. Pea is a little firmer. Bituminous slow locally, but brisk at tide. Slack coal continues scarce.

Anthracite—Business has not improved the past week and just now has probably fallen back into the lowest summer level. A slight improvement may be expected during the last few days of the month, but there are close observers who believe there will be no real activity before the end of September, and then the improvement will be gradual. The real trouble is there is too much coal above ground and all concerned know it.

No well informed buyer is paying higher than the April circular except for some special coals, though many of these orders are placed in the spring and the price protected until Oct. 1. This may be contradicted here and there, but that will only evidence a desire to protect the shipper, who is anxious to keep the lowest prices confidential.

Dealer trade is completely flat. It is feared by some of the more substantial dealers that the low prices at which coal was bought during the summer and spring will have an ill effect on the early fall retail trade. After the season of inactivity, some dealers in their anxiety to secure business, will overlook the opportunity to recoup and start price cutting. As bearing particularly on this phase of the situation, two large dealers in the Kensington district, where the price cutting raged disastrously last winter, state that they intend to actively engage in the struggle this fall if the same tactics are used.

Stove is still the most active, with egg in fair demand, and chestnut continuing to accumulate with practically no sales at all. Pea continues to stiffen, due essentially to the fact that some independent operations having contracted for their entire output on this size until late into the fall have really no coal to offer. However, no one is buying at an advanced price.

The recent decision of the Interstate Commerce Commission ordering a reduction in the Tidewater rates seems to meet with the approval of the retail dealers generally, and also the independent operators. Of course the lowering of the tide rates will not directly affect the local or line trade, but the opinion is general that there must certainly be some adjustment to place them on a parity. As a matter of fact the State Public Service Commission almost a year ago ordered a drastic reduction in the line rates, but they have not as yet become effective, an appeal having been taken by the railroads.

The current circular prices, to which the Pennsylvania State tax of 2½% must be added, are as follows:

	Line	Tide		Line	Tide
Broken	$3.40	$4.65	Pea	$2.50	$3.25
Egg	3.65	4.90	Buckwheat	1.25	2.25
Stove	3.90	4.90	Rice	.85	1.75
Chestnut	4.05	5.15	Barley	.50	1.50

Bituminous—The dullness in the domestic trade is slightly offset by the increased demand caused by the commercial revival, which it is expected will almost amount to a boom by the time winter comes. The export trade continues to grow and the inquiries from abroad are increasing daily. Many of these inquiries are coming from responsible intermediaries in this country who guarantee payment, and for this reason quite a number of concerns who have never entered the export trade are quoting prices on the inquiries.

The only fluctuation in price during the past week has been in slack coal, which also showed an increase the previous week. This slight scarcity of slack is due to the lack of demand for the three-quarter size.

The prices during the past week have been about as follows:

Georges Creek Big Vein	$1.6[illegible]@1.75	Fairmont gas lump, mine-run	$1.15@1.25
South Fork Miller Vein	1.50@1.60	Fairmont gas, slack	.70@ .80
Clearfield (ordinary)	1.00@1.20	Fairmont lump, ordinary	.85@ .95
Somerset (ordinary)	1.00@1.15	Fairmont mine-run	.75@ .80
West Va. Freeport	.85@ .95	Fairmont slack	.55@ .65

BALTIMORE

The ear-marks of better times are stamped at every hand. Coal prices are stiffening, and the movement growing. Industrial wheels are humming in earnest.

The mining sections report an increasing tonnage movement, and there is a tendency among producers to hold for better prices. During the week slack moved upward, and was strong at 60 and 65c., against sales not many weeks back of 30 to 35c. Coke too is showing 10 to 15c. advances over prices of a couple of weeks ago, and is held more strongly both in West Virginia and Pennsylvania.

Best western Maryland coals were strongly held, spot prices for Georges Creek big vein being around $1.75 as a rule and for Tyson around $1.35. South Fork was bringing about $1.35; while Clearfield was offered at from $1 to $1.05. Lower grade Pennsylvania coals were offering at from 90 to 95c. West Virginia Freeport was offering at 80 to 90c., and Fairmont three-quarter at 85 to 90c.

Export business continues brisk. During the past week a total of 22,527 tons was loaded at Curtis Bay and Port Covington for foreign ports. Bunker fuel taken by these carriers totaled 3403 tons.

HAMPTON ROADS

Export movement still holding up well. Fair amount coal going coastwise. Prices remain unchanged.

There has been some large export cargoes moving from Tidewater and a fair coastwise business. There has also been some coal loaded into colliers for the Government and bunker vessels have been supplied with a reasonable quantity, ranging from 300 tons to as high as 1400 or 1500 tons, according to the size of the vessel and her foreign destination. As is always the case the New England ports have taken practically all of the coastwise movement.

The demand during the week has not been quite so heavy and there is some little accumulation on the railroads which will, however, be greatly reduced during the coming week as considerable vessel tonnage is due to take care of contracted coal. Prices on the various grades supplied at Tidewater remain practically unchanged.

Railroad Tonnages—Dumpings over the local piers for the past several weeks compare as follows:

	Week Ending				
Railroad	Aug. 14	July 10	July 17	July 24	July 31
Norfolk & Western	171,252	174,822	180,090	197,913	188,593
Chesapeake & Ohio	83,390	76,397	116,862	96,627	84,018
Virginian	63,066	57,467	78,710	86,523	39,335
Totals	317,708	308,686	375,662	381,063	311,949

OCEAN FREIGHTS

A large number of steamers have been chartered to carry coal to Mediterranean, South American and West Indian ports during the past week, and while rates to the Mediterranean and to the West Indies are unchanged, rates to South America are weaker. This weakness applies at present only to steamers available within the next 30 days, the general impression being that the competition of grain from here will stiffen the market after this period.

The freight market is now quotable as follows:

To	Rate	To	Rate
Havana	$2 75@3 25	Bermuda	**$3.00**
Cardenas or Sagua	3.00@3.50	Vera Cruz	3.25@3.75
Cienfuegos	3.25@3.50	Tampico	3.25@3.75
Port au Spain, Trinidad	3.50	Rio	8.16@8.28
St. Lucia	3.25@3.50	Santos*	8.40@8.64
St. Thomas	3 00	Montevideo	**7.86**
Barbados	3.50	Buenos Aires or La Plata†	**7.92**
Kingston	3 00@3.50	Rosario	**8.28**
Curacao	3.25	West Coast of Italy	9.36
Santiago	3 25@3.50	Barcelona**	8.40@8.64
Guantanamo	3 25@3.50	Valparaiso or Callao	6.50@7.00
Demerara	4.50@5.00	Marseilles	8.64@8.88

Note—Rates noted in **bold face** type are only approximate.

* Consignees paying dockage dues. ** Spanish dues for account. † Quotations on Plate coal by British steamers; neutral steamers are more difficult to obtain and the rates are always higher.

LAKE MARKETS

PITTSBURGH

Slight further improvement in demand, and operations somewhat better, at 55 to 60% of capacity. Prices firmer, particularly on contract.

Lake shipments have increased slightly and the iron and steel trade is consuming a trifle more coal, though the increase is not marked since the steel plants have been running practically at capacity since early in July. General manufacturing demand shows a slight increase. The Pittsburgh district mines are operating at a little better rate, at between 55 and 60% of capacity. Prospects are that demand will continue to improve, although perhaps slowly.

The market as a whole is a shade firmer; gas slack for prompt shipment now commands about 60c., an advance of 5c. in the week, while steam slack is usually to be picked up at about 50c. Operators are stiffer in their views as to contracts running to Apr. 1 and are usually quoting $1.15 on mine-run, although $1.10 can be done, this comparing with $1.05 until lately. The Connellsville regions continue to make fairly heavy shipments of coal for export, but the Pittsburgh district proper has been unable to participate in the movement, on account of its higher costs.

We quote the market for free coal as follows: Slack, 50@60c.; nut and slack, 90@95c.; nut, 95c.@$1; mine-run, $1@1.05; ¾-in., $1.10@1.15; 1¼-in., $1.20@1.25, per net ton at mine, Pittsburgh district. On contract to Apr. 1, slack, 95c.; mine-run, $1.10@1.15; ¾-in., $1.20@1.25.

BUFFALO

Some stir in bituminous, with promise of more. Slack the best feature. Less demurrage coal. Prices slightly stiffer. Anthracite not moving. Prospect of a rush in the fall.

Bituminous—The trade improves at a slow rate, though there is enough added activity to give promise of something good in the fall. Business of any sort is not expected to be active in August. There is evidence of a larger need of manufactured goods and that alone will create some demand. At one time it seemed as if consumers bought only on the urgent solicitation of sellers but it is a trifle different now, though the improvement is not large. The Canadian trade is not in business to any great extent and shows no indication of improving. Buffalo sells considerable coal there, so that the business here feels the effects of the light demand acutely.

Prices are a little stronger week by week but continue on the basis of $2.70 for best Pittsburgh lump, $2.55 for three-quarter, $2.45 for mine-run and $2.25 for slack. There has been some special dullness in Allegheny Valley slack, but sizes are about 25c. lower than Pittsburgh as usual.

Anthracite—Shipping agents are devoting most of their time to estimating the amount of shortage to be made up when the fall season sets in. There is little doubt that average sales will be made then if they cannot be made now. There is no increase in the movement of anthracite, but it is expected that the demand will improve before the end of the month and possibly it will continue, as there are certainly shippers who have not yet come into the market.

Regular quotations of anthracite, f.o.b. Buffalo are $5.60 for grate, $5.85 for egg and stove, $6.10 for chestnut and $4.05 for pea, per gross ton. From this maximum price a reduction of 10c. per ton is made during August. The prices include the Pennsylvania tax.

The shipments of anthracite from this port are still less than at this time a year ago on account of the congested state of the upper-lake docks. For the week the total was 131,500 tons.

TORONTO, CAN.

Approach of fall stimulates some activity in the market. Slack a trifle stiffer.

Some improvement in trade has been noted during the last two weeks, as many consumers are laying in stocks of anthracite in anticipation of the usual fall increase in prices. The demand for bituminous continues light, with some stiffening in the price of slack owing to the falling off in the call for lump coal on the Upper Lakes. Foundry coke is also firmer. Quotations for best grades of coal are as follows: Retail, anthracite, egg, stove and nut, $7.50; grate, $7.25; pea, $6. Bituminous retail steam, $5.25; screenings, $4.25 to $4.50; domestic lump, $6; cannel, $8; wholesale f.o.b. cars three-quarter lump, $3.56; screenings, $3.

CINCINNATI

Continued improvement in domestic demand is the most encouraging factor. Prices steadier. The steam market not strong.

A slightly improved call for the domestic grades from all districts is noted during the past week, though it is by no means as yet up to a normal volume. However, it is one of the best indications in the market, showing that retailers are beginning to realize the necessity of securing their usual stocks.

A sympathetic improvement in the steam market is looked for, though consumption does not warrant a statement that the market is any stronger. However, it seems certain that buying on the part of large consumers will approach something like a normal volume soon, and if this is the case steam grades will benefit.

COLUMBUS

Domestic trade continues slow, but there is better buying of steam sizes. The price list is fairly well maintained. Future prospects appear brighter.

The coal trade in Ohio has remained fairly quiet. The domestic buying shortly after Aug. 1 has dropped off until domestic lines are somewhat weak. Stocking is not as active as was expected and this has a bad effect on trade conditions. The rural sections are apparently not buying as much as formerly, due to the continued rains which interfered with the work of farmers.

Steam business shows more activity all along the line. Buying for manufacturing purposes is better and those having contracts are taking a larger tonnage. There is not as much cheap steam coal offered as formerly owing to restriction of shipments when the coal is not sold. Railroads seem to be taking a larger tonnage, and some of the trunk lines are storing to guard against an emergency.

In Lake trade there is not a great deal moving. Congestion on the docks of the Upper Lake ports still continues and the movement to the interior is slow. As a result shipments from Ohio fields to the head of the Lakes are not large. But on the other hand there is a good tonnage of West Virginia coal moving to the Northwest. During the week ending Aug. 13 the Toledo docks handled 104,000 tons.

One of the best features is the continued demand for anthracite. Local jobbers report a much better demand than usual for that variety. Coke is also showing some activity.

Mines have been working at about the following percentages of full capacity:

	Week Ended					Week Ended			
District	July 24	July 31	Aug. 7	Aug. 14	District	July 24	July 31	Aug. 7	Aug. 14
Hocking....	25	15	25	25	Cambridge.	25	30	30	35
Jackson....	20	20	20	20	Masillon...	25	25	25	30
Pomeroy ..	40	35	25	40	Eastern O..	55	50	30	55
Crooksville.	20	20	30	30					
					Average..	30	29	30	33

CLEVELAND

Coal receipts the first of the week almost double those of any week the last two months. Prices showed a decided weakness.

Something over 400 cars of coal arrived here over Sunday; 80% of this was slack and slack prices showed a marked decline. Pan handle was sold at $1.50 while No. 8 went at the same price though a week ago it was 5 to 10c. higher. It is the general opinion that fine coal will be off another 5c. before the week is over. More than half the receipts were carried over.

It seems that operators watch this market very closely and all elect to ship their surplus into Cleveland at one time. Such has been the case about every six to eight weeks all summer and spring. The absorbing power of the Cleveland market has been overestimated and is now practically exhausted by the large amount of coal on track.

The Lake trade shows no indication of any change until the grain crop begins to move next month. Lake iron ore sales are being made and while the tonnages are small, the aggregate is large. Furnaces using Lake Superior ores seem to be rounding out stocks and needing more than it was thought they would.

Quotations for shipment to jobbers are as follows:

	Pocahontas	Youghiogheny	Fairmount	Bergholz	Ohio No. 8
Lump............	$3.70			$2.30	
Lump, 6-in........				2.30	
Lump, 1¼-in.......				2.10	$2.10@2.15
Lump, ¾-in.......		$2.15@2.20	$2.00	2.00	2.00
Egg.............	3.70			1.95	
Mine run.........	2.70	2.10@2.15	1.90	1.85	1.80@1.85
Slack...........		1.55	1.70	1.50	1.50

COKE

CONNELLSVILLE

Furnace coke still in the dumps, but foundry coke in better demand. Much erection of byproduct ovens. Production and shipments slightly decreased.

The coke market has shown no general improvement, prompt furnace coke being still available at $1.50 while there is scarcely any inquiry for contract furnace coke, but foundry coke is moving much better and prices are a shade firmer. Hopes are still entertained that the furnace coke market will advance sharply later in the year, but there is no very definite basis for such expectations. The coke market has not advanced while steel products have been advancing steadily for seven months and pig iron has been advancing sharply in the past 30 days. Sufficient reason for the failure of coke to advance is found in the heavy increase in byproduct coking capacity in the past couple of years, evidently causing the total capacity to be far in excess of requirements, and within the past two months work has been started, or definitely projected, on six additional byproduct plants, to have a total capacity of 1,500,000 tons or more a year.

Prompt furnace coke is offered rather freely at $1.50, despite the fact that some of the merchant ovens have lately curtailed output. On contract coke the market is not clearly defined, there being so little inquiry, but operators would no doubt sell at $1.65 or $1.70 for shipment to Oct. 1, the usual asking prices for shipment to Jan. 1 being $1.85@2. Foundry coke is moving more freely and prices are firm despite the softness in furnace coke. Quotations are: Prompt foundry, $2.20@2.60; contract foundry, $2.30@2.60, per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Aug. 7 at 366,840 tons, a decrease of 10,570 tons, and shipments at 369,725 tons, a decrease of 3457 tons.

Buffalo—There is still a good movement, with the tone of the market much better than it has been for a long time. New ovens are reported in operation at coke-producing centers, having been started up to meet the increased demand. The fact that the steel and iron orders received at the furnaces are gaining on them is sufficient reason for the movement of coke. Prices are firm on the basis of $4.25 for best 72-hr. Connellsville foundry and $3.30 for stock coke.

Chicago—Gas house coke has been quiet, and the demand for byproduct sizes has been steady at slightly better prices. Foundries in the Chicago district have not as yet purchased one-half of their requirements, but during the past week some disposition has been shown to buy coke ahead. Quotations are as follows: Byproduct, $4.75@5.10; Connellsville, $4.75; Wise County, $4.65@4.75; gas coke, $3.75@3.90; furnace, $4.85.

Birmingham—The demand for furnace coke is rapidly increasing, due to many furnaces, which have been idle for the past 12 months, going into blast. The Sloss Sheffield recently put in their Florence furnace and their City furnace at Birmingham, and the Tennessee Coal, Iron & R.R. Co. have recently blown in their No. 4 furnace. The starting up of these furnaces called for a large tonnage of coke, and the West Blossburg ovens of the Sloss Co. and the Brookside ovens, both batteries having been idle since last October, have recently been put into blast, as well as the Virginia ovens of the Gulf States Steel Co. at Virginia City, which will be again blown in within the next few days. The inquiry for foreign shipments of furnace coke is quiet, though 72-hr. foundry coke is finding a fair market.

SOUTHERN MARKET

LOUISVILLE

Approach of the stocking season gradually forcing buyers into the market. Market steadier than for some weeks.

With half of August gone and the period when stocking operations have become imperative, business is showing improvement, though not at the rate hoped for. The industrial requirements are not yet as great as they should be, but the demand in both quarters is better than for weeks. The farmers are selling off enough of their crops to meet their obligations. Cotton gins and seed presses are taking their supplies in the South and there is some strengthening of the call in other directions.

Prices have not been much stimulated as yet, however, and continue on the same basis as for some weeks.

BIRMINGHAM

Outlook better than for past two years. Production steadily increasing.

Not for the past two years have conditions been as favorable for a steady market on both lump and steam coal. Additional furnaces are being blown in nearly every week, which takes a large tonnage off of the regular market; as a result operators are finding much less trouble to move their output, which is steadily increasing. If the improvement continues, the next 60 days will see conditions normal, and all mines working to practically full tonnage for the first time in two years.

MIDDLE WESTERN

GENERAL REVIEW

Trade remains nearly stationary. Increased prices check smokeless orders. Western screenings unchanged. Anthracite trade flat.

None of the Illinois and Indiana shippers express themselves as believing any improvement has been shown in the situation the past week, and some have found conditions a little less to their liking than earlier in August. The only marked change is the present sluggishness of West Virginia smokeless coals.

The ordering since the first of the month has been very slow at the increased August prices, apparently most of the dealers having met their current demands on the July basis. Difficulty in distribution of grades is noted; sometimes the lump market being too strong, and again the slack market forging ahead. Some trouble is experienced in marketing coarse smokeless sizes because suitable equipment is not available. Many wholesalers are predicting that towards the latter part of the month higher prices will prevail for Western coarse coals.

Indiana and Illinois mines as a rule are still operating at about half time or a little better, and very few of them have been fortunate enough to obtain sufficient business to place their mines on anything near a full time basis. A number of inquiries have been made by telephone and telegraph by the Northwestern trade during the last week; the buyers seemed to be endeavoring to cover future requirements.

Prices generally are still well maintained in spite of the dearth of orders. It is apparent that a large proportion of the retailers and household buyers have been withholding the purchase of their usual summer supplies in the hope that prices would break, as is usually the case, but they have been badly disappointed this season.

Threshing is still backward and this has had on unfortunate effect on the forwarding of domestic coals. Screenings are torpid and generally being sold around 60c., with some of the Indiana product having a lower freight rate to the more important points of distribution selling at 5c. to 10c. higher.

CHICAGO

Generally firmer tone to the market for Middle Western coals. Retailers stocks less than normal. Railroads still taking minimum tonnages. Eastern grades slow.

Fine coals from Franklin and Williamson County have been a little stronger recently, and while domestic buying has lagged, most of the operators are optimistic that the $1.75 price will prevail after Sept. 1. Some orders have been taken for shipment of domestic sizes during the balance of the month to retailers at $1.60. There is a firm tone in southern Illinois coals, and the tonnage is slowly increasing every day. Buyers of screenings from southern Illinois mines are apparently waiting for the usual drop in prices of former years, but will likely be disappointed this season. Carterville washed coals are in strong demand.

Some improvement is noted in the call for Springfield coals, and it is expected domestic egg and lump will be advanced 15c. very shortly. Railroads are still only taking their minimum requirements from the Springfield and Peoria districts.

A little improvement is noted in the tonnage of Indiana mine-run for the Chicago market, but shipments are much less than usual for this time of the year. Domestic lump is selling at from $1.40 to $1.50, while some of inferior quality is going at from $1.30 to $1.35. The Indiana retailers have smaller stocks on hand than ordinarily at this season of the year, and when they begin to demand shipments it is certain that they will have to have coal in a hurry. Very little Clinton and Sullivan County coals have been moving to Chicago. Knox County operators have been shipping steam coal mostly. Higher prices prevail for screenings in Indiana than in the Chicago market, the difference being about 10c. per ton.

Buying of smokeless on Chicago tracks is very slow, and a few sales have been made of prepared sizes at a discount of as high as 50c. under the August circular. Egg seems to be the weakest size. Circular prices for Pennsylvania smokeless have not been raised as yet; the demand for lump and egg has been steady, while nut is slow. West Virginia mine-run is firm at $1.40. Splint is improving in the West, probably due to better demand at the seaboard.

Some Hocking is being shipped to Northwestern points via the Lakes, but the tonnage is considerably less than in previous seasons. All-rail Hocking is being very slowly absorbed by the retailers and farmers.

Millers Creek advanced on Aug. 15 to $2.25 on 4-in. block, $1.85 on egg, and $1.55 on nut; the other eastern Kentucky coals are not affected and prices still cover a wide range.

Anthracite trade is languid. Some of the retailers have a good amount of hard coal on hand, although not the stocks of previous years. It will take colder weather to bring about a replenishment. The dilatory attitude of a large number of dealers who will wait until the last minute before ordering anthracite is continuing to have an unsatisfactory effect on the volume of shipments to Western points.

Quotations in the Chicago market are as follows:

	Williamson and Franklin Co.	Springfield	Sullivan	Clinton	Knox and Greene Cos.

Season total	426,679	312,496	392,288	392,407

INDIANAPOLIS

Chicago demand for Indiana coal improved; 80c. obtainable both there and in the open market for screenings. Movement of domestic grades improves. Retailers advance price of anthracite and Pocahontas.

Indiana coal operators note an improvement in the market at Chicago, where they always expect to sell a large tonnage. Screenings are selling there at 80c., which is considerably higher than the prevailing level for several weeks. The same figure is obtainable in the open market.

The weather continues against farm operations and the small marketing of wheat and oats has not made any increase in the railroad demand for coal. While the factories having war orders, mainly iron and steel plants, are consuming coal heavily, other industries show no increase. Indianapolis retailers have made the first of the usual season advances in prices, raising anthracite and Pocahontas 25c. a ton. The present schedule is:

	Per Ton		Per Ton
Linton No. 4 forked	$3.00	Pocahontas forked lump	$5.75
Indiana lump, forked	2.75	Pocahontas shoveled lump	5.25
Indiana lump and egg, screened	2.50	Pocahontas mine run	4.25
Kanawha lump, forked	4.25	Pocahontas, nut and slack	3.75
Ohio Hocking lump, forked	4.25	Anthracite chestnut	8.00
Ohio Hocking, washed egg	4.50	Anthracite stove and egg	7.75
Kentucky lump	4.50	Anthracite grate	7.50
Ohio Jackson lump, forked	5.00	Connellsville coke	6.00
Blossburg smithing	5.50	Indianapolis by-product coke (all sizes)	5.50
Cannel lump	6.00		

ST. LOUIS

Slight improvement in some districts. Orders for domestic grades coming in.

The market situation, as regards the inner group of mines, has improved slightly during the past week. Dealers are beginning, at last, to order domestic coal and lump particularly is moving more freely. The prices, however, are practically the same as last week. In the Southern Illinois field the market is about the same.

The quotations at the end of the week were:

	Wilm. & Frnk. Co.	Sparta	Mt. Olive	Standard
6-in. lump	$1.35@1.40	$1.25	$1.40	$1.00
2-in. lump	....	.95	1.25	.90

Grand total	2,200,551	2,434,614	2,680,465	2,854,445

FOREIGN MARKETS

GREAT BRITAIN

Aug. 6—This has been a broken week in the coal industry, and although every effort has been made to curtail the holidays in view of the urgent need of this country and our Allies for every ton of coal which can be produced, operations at the pits were not fully resumed in all cases until Wednesday or Thursday, some of the miners delaying their return to work until then. The majority of the men responded to the appeals made to them, however, and it is believed that the output has now been restored to its normal level. Perhaps the most important event of the week in the trade has been the issue of the expected announcement that the shipment of coal to our Allies is to be controlled by the Exports Committee. The new Order in Council comes into operation on Aug. 13, and has naturally been the subject of much discussion in coal-shipping circles. It is feared that business with France, Russia and Italy may be hampered to some extent by delays in issuing licenses; but on the other hand, it can hardly be the intention of the Government to seriously interfere with the total exports of the allied countries, who rely so largely upon us for their supplies.—"The Iron and Coal Trades Review."

Aug. 6—The new Government order prohibiting the export of coal to all destinations other than British possessions and protectorates, except under license, has had a rather unsettling effect on the market and business is on very quiet lines. Quotations are nominally as follows:

Best Welsh steam	Nominal	Best Monmouthshires	$7.20@7.44
Best seconds	Nominal	Seconds	6.96@7.20
Seconds	$7.44@7.86	Best Cardiff smalls	5.40@5.52
Best dry coals	7.44@7.86	Cargo smalls	4.44@4.80

Freights—Chartering is very slow at present because of the new restrictions. Rates are nominally as follows:

Gibraltar	$3.24	Naples	$4.08	St. Vincent	$4.32
Marseilles	3.48	Alexandria	4.80	Rio de Janeiro	6.24
Algiers	3.82	Port Said	4.80	Monte Video	5.76
Genoa	4.08	Las Palmas	4.08	River Plate	6.00

Coal Contracts Pending

The purpose of this department is to diffuse accurate information of prospective purchases and prices with a view to affording equal opportunity to all, promoting market stability and inculcating sound business principles in the coal trade.

+Indicates contracts regarding which official information has been received.

Supplemental Notes

Under this heading additional or supplemental information regarding old contracts appears, together with the page number of the original notice.

+No. 854—Tompkinsville, N. Y.—Bids have been received on this contract (Vol. 7, p. 1085, Vol. 8, p. 115), which provides for furnishing the Lighthouse Service with coal, as follows:

Schedule No. 1	Base Price	Delivery Buckets	Adj. Price per Million B.t.u.
Whitney & Kemmerer	$3.55	$0.34	$0.14
Weston Dodson & Co.*	3.50	.34	.127
W. P. W. Haff	3.49	.36	.14
Commercial Coal Co	3.74	.37	.139

Schedule No. 2	Base Price	Delivery		
		Buckets	Bags	On Deck
Weston Dodson & Co.*	$5.30	$0.34	$0.50	$0.40
W. P. W. Haff	5.51	.36	.58	.50
Commerical Coal Company	5.54	.55	1.50	1.50

Schedule No. 3	Base Price	Delivery		
		Coal Shed	Bags	On Dock
F. H. & A. H. Chappell Co.*	$6.45	$0.20	$0.60	$0.50

Schedule No. 4	Base Price	Delivery		
		Coal Shed	Bags	On Dock
Pinniger & Manchester*	$7.25	$0.75	$0.40	$0.40
Newport Coal Co	7.50	.80	.45	.45

Schedule No. 5	Base Price	Delivery			Adj. Price per Million B.t.u.
		Bunkers	On Deck	Bags	
Willard Brothers	$2.90	$0.10	$0.02	.....	$0.094
Weston Dodson & Co	3.05	.20	.20	.30	.097
Empire Coal Mining Co	2.92	.10	.03	.....	.093
W. H. Bradford & Co*	2.79	.10	.02	.15	.088
Hetherington& Co	2.84	.....	....	.....	.091
W. P. W. Haff	2.87	.29	.29	.29	.091
C. J. Wittenberg	2.84	.10	.03	.10	.091
Commercial Coal Co	3.00	.30	.30	.75	.10

Schedule No. 6	Base Price	Delivery, Coal Bin	Adj. Price per Million B.t.u.
Richmond Ice Co.*	4.75	1.10	.156

Note—While the delivery price of $1.10 per ton is in excess of 10 + of the base price per ton, as mentioned in paragraph 31 of the specifications, it is not considered that the delivery charge is excessive, for the reason that all of this coal has to be delivered by truck to the General Lighthouse Depot, which method of delivery is much more expensive than the methods by which the coal called for under the other schedules is to be delivered. The acceptance of this bid is therefore recommended.

Schedule No. 7	Base	Delivery			Adj. Price per Million B.t.u.
F. H. & A. H. Chappell Co.*	$3.70	$0.35	$0.25	$0.35	$0.126

Schedule No. 8	Base Price	Delivery			Adj. Price per Million B.t.u.
		Bunkers	On Deck	Bags	
Pinniger & Manchester*	$5.25	$0.40	$0.40	$0.40	$0.176
Newport Coal Co	5.40	.45	.45	.45	.183

* Recommended for acceptance.

Address Lighthouse Inspector, Tompkinsville, N. Y.

+No 873—Springfield, Mo.—Six bids have already been submitted on this contract (Vol. 7, p. 1086), which provides for furnishing the local Board of Education with approximately 1400 tons of screened Kansas lump coal. No definite date has apparently been set for making the awards, but it is anticipated it will be soon. Address Secy. Edw. J. Hoffman, Bd. of Edu., Springfield, Mo.

+1032—Cleveland, Ohio—The bids on this contract (p. 115), which provides for furnishing the Board of Education with coal during the ensuing year, have been opened, and tests are now being conducted of the samples furnished by the bidders. The contract will probably be awarded within a few weeks. Address Dir. of Schools F. C. Hogen, School Headquarters, Rockwell Ave. and East Sixth St., Cleveland, Ohio.

+1064—Joliet, Ill.—This contract (p. 116), which provides for furnishing the Washington St. plant of the city Water Works and the Fire and Police Department with coal, has apparently been readvertised on two separate occasions, the first bid being requested for Aug. 2, while the latest has again moved the date up to 2 p.m., Aug. 23. A certified check for $100 must accompany each bid. Address City Clk. Henry W. Odenthal, Joliet, Ill.

+1068—New York, N. Y.—Bids have been received on this contract (pp. 117, 243, 283), which provides for furnishing the Department of Docks and Ferries with approximately 1500 tons of egg coal, as follows: Pattison & Bowns, $5.33; W. P. W. Haff, $5.33; Gavin Rowe, $5.51. An insufficient deposit accompanied the bid of W. P. W. Haff, so that it could not be considered. No announcement of award has yet been received. Address Dock Com. R. A. C. Smith, Pier A, North River, New York.

+1118—Uniontown, Penn.—This contract (p. 158), which provides for furnishing the various schools of Perry Township with coal during the ensuing year, should have been noted under Uniontown instead of Connellsville, as appeared in the previous item. Address Secy. J. R. Martin, Bd. of Edu., Uniontown, Penn.

New Business

+1253—Stanley, N. D.—The Board of County Commissioners of Montrail County will receive sealed bids until 2 p.m., Sept. 7, for furnishing and delivering coal as required at the County Court House during the ensuing year. All bids must be accompanied by a certified check for $100. Address County Audr. H. P. Duggan, Court House, Stanley, N. D.

+1254—Bowling Green, Ohio—The Board of Education at this place received bids until noon, Aug. 17, for furnishing and delivering Jackson and Hocking, straight lump and three-quarter lump, as may be required during the ensuing year; bids will also be received on West Virginia splint and Pocahontas coal. Address Clk. George W. Fearnside, Bd. of Edu., Bowling Green, Ohio.

+1255—Ft. Benton, Mont.—The Trustees of School District No. 1 received sealed bids until 6 p.m., Aug. 14, for furnishing 200 tons of mine-run or nut coal to be delivered in the basement of the schoolhouse as required. Bidders are required to state what mine they propose furnishing the coal from and location of same. Address Clk. Ezra L. Crane, School Dist. No. 1, Ft. Benton, Mont.

+1256—Atlantic City, N. J.—The Board of Education at this place usually contracts for its fuel requirements some time during September. The tonnages required and the prices at which the business was done during last year were as follows: Pea, 1000 tons, $4.36; stove, 500 tons, $6.24; egg, 500 tons, $6.20. Deliveries are to be made as required. Address Board of Education, Atlantic City, N. J.

+1257—Watertown, S. D.—The Board of County Commissioners will receive bids until 2 p.m., Sept. 7, for furnishing and delivering approximately 90 tons of Pocahontas smokeless lump coal. Address County Audr. J. S. Johnson, Bd. of County Comrs., Watertown, S. D.

+1258—Angola, Ind.—The Indiana Utility Commission usually contracts some time in September for its annual requirements of coal, amounting to 2200 or 2400 tons. Cambridge, Ohio, coal is being used on the current contract, the cost of which is as follows: Freight, $1.35; coal, $1.10; unloading, 12½c.; total, $2.57½. Address Indiana Utility Commission, Angola, Ind.

1259—Denver, Colo.—The Colorado Power Co. usually contracts for its annual requirements of coal, amounting to 5000 tons of lignite and semibituminous slack, some time in September. The coal usually costs 60c. to 80c. at the mine, and the business is not generally let on competitive bids. Coal from Leadville and Salida, Colo., is used. Address Purchasing Agent, Colorado Power Co., Denver, Colo.

1260—Louisville, Ky.—The Watterson Hotel at this place consumes about 2500 tons of nut and slack coal per year and will be in the market some time in September. Bidders should include cost of delivery. Address Mgr. Jones, Watterson Hotel, Louisville, Ky.

+1261—Kenmare, N. D.—The Kenmare School District No. 28 will receive sealed bids until 8 p.m., Sept. 14, for furnishing coal to the city schools as may be required during the ensuing year. Bidders should specify whether upper or lower Lake coal will be furnished. Address Clk. J. M. Rohe, Kenmare, N. D.

1262—Des Moines—Bids will be asked for by the Independent School District soon for supplying coal to the 60 schoolhouses in the local school district. The board buys steam, mixed nut and lump coal. The contract will probably be let about Sept. 1. Address Board of Education, Des Moines, Iowa.

1263—New Orleans, La.—The Crescent City Stock Yards & Slaughter House Co. is now testing samples of washed and nonclinkering coal preliminary to letting its contract, involving approximately 5000 tons. It is expected the contract will be awarded before Sept. 1. Address Purchasing Agent, Crescent City Stock Yards & Slaughter House Co., New Orleans, La.

+1264—Omaha, Neb.—The City Government received bids until Aug. 17 for furnishing Illinois 1¼-in. screened and Centerville, Iowa, lump coal during the coming year. Address City Purchasing Agent, Omaha, Neb.

+1265—Hazleton, Penn.—The Board of Education at this place usually contracts some time in September or October for its annual requirements of coal, amounting to approximately 1500 tons of pea and stove. It usually gets bids from one of the local collieries and pays for the delivery separately, at the rate of 32c. per ton. The coal usually costs $2.75 for pea and $3.75 for stove. Address School Board, Hazleton, Penn.

+1266—Wichita, Kan.—The Sedgwick County Board of Commissioners received bids until Aug. 16 for supplying the various county institutions with coal during the ensuing year. Address County Clerk, Wichita, Kan.

+1267—Wellsburg, W. Va.—The City Water Board at this place received bids until Aug. 17 for furnishing the local water plant with coal during the ensuing year. Address Secy. J. F. Thompson, City Water Board, Wellsburg, W. Va.

+1268—Steele, N. D.—The Kidder County Board of Commissioners will receive bids until 2 p.m., Sept. 1, for furnishing 140 tons of lignite coal, to be delivered in the basement of the courthouse, as required during the ensuing year. Address County Auditor, Steele, N. D.

+1269—Council Bluffs, Iowa—The Board of Education at this place received sealed bids until 8 p.m., Aug. 17, for furnishing and delivering coal to various school buildings during the ensuing year, as required. Bids are requested on 1¼-in. lump from Montgomery County, Illinois, and from the Centerville district of Iowa. The successful bidder will be required to furnish a bond of $1500. Address Secy. J. J. Hughes, Independent School Dist., Council Bluffs, Iowa.

+1270—Lake City, Minn.—The Municipal Electric Light and Water Plant at this place will contract some time in September or October for its annual requirements of coal, amounting to approximately 3300 tons. Island Creek splint nut coal is ordinarily used and the usual price is about $3.85 per ton, f.o.b. Lake City. The business is let on competitive bids. Adress Supt. M. J. Stowe, Municipal Elec. Lt. and Water Plant, Lake City, Minn.

+1271—Hastings, Neb.—The Board of Commissioners for Adams County will receive bids until 9 a.m., Aug. 30, for coal as may be required at the Court House during the year beginning Sept. 1. Bidders should specify the kind of coal and price per ton. The sucessful bidder will be required to give a satisfactory bond. Address County Clk. Charles H. Hudson, Hastings, Neb.

1272—West Point, Neb.—Bids will be received by School District No. 1 until noon, Aug. 23, for furnishing and delivering 150 tons of coal as may be required during the ensuing year. Bids are requested on Weir City nut, Illinois, Franklin County No 1 nut and Pocahontas mine-run. Address Secy. J. C. Hansen, School Dist. No. 1, West Point, Neb.

1273—Louisville, Ky.—The Starks Realty Co. of this place consumes about 900 tons of nut and slack coal per annum, for which they usually contract about Sept. 1. Deliveries are made by wagon and they have a storage capacity of 40 to 50 tons. Address Pur. Agt. Clifton Rochs, Starks Realty Co., 4th and Walnut St., Louisville, Ky.

+1274—Des Moines, Iowa—The Board of Supervisors of Polk County is conducting a series of tests to determine whom this contract should be awarded to and a decision will be reached about Sept. 1. The bids submitted were: Dan O'Grady, $1.89; Evans-Lloyd, $1.90; Carbon Coal Co., $1.90; Bennett Bros., $1.95, all for mixed nut. Address Board of Supervisors, Polk County, Des Moines, Iowa.

+1275—Ft. Worth, Tex.—The School Board at this place has authorized the purchase of approximately 500 tons of domestic lump coal in the open market. Address Supt. Moore, of City Schools, Ft. Worth, Tex.

1276—Cleveland, Ohio—The Acme Foundry Co. of this place usually consumes about 200 tons of 3x6-in. egg coal per annum, for which they ordinarily contract some time in September. Deliveries are made by rail at the rate of about 40 tons per month. They have a storage capacity of 100 tons. Address Purchasing Agent, Acme Foundry Co., Cleveland, Ohio.

+1277—Hay Springs, Neb.—The Board of Education, District No. 3, will receive sealed bids until 6 p.m., Aug. 31, for furnishing coal to the public schools as required during the ensuing year. Address Dir. U. L. Parsons, Hay Springs, Neb.

+1278—Bloomington, Ind.—The Board of County Commissioners at this place will receive bids until Sept. 7 for furnishing 100 tons of No. 4 coal. Address County Audr. W. F. Kinser, Bloomington, Ind.

+1279—Jamestown, N. D.—The County Government will receive sealed bids until 2 p.m., Sept. 1, for furnishing and delivering 150 tons of deep-mined lignite coal and 20 tons of anthracite stove coal. A separate bid f.o.b. cars at Jamestown will be received on the lignite coal. Address County Audr. Andrew Blewett, Jamestown, N. D.

1280—Burlingame, Kan.—Sealed bids will be received until Aug. 28 for furnishing coal as may be required at the school buildings of District No. 7 during the ensuing year. Address Clk. F. M. Nelson, Burlingame, Kan.

1281—Dallas, Tex.—The Board of Education is in the market for from 800 to 1200 tons of domestic nut coal. The maximum price has been limited to $1.70 per ton. Address Secy. C. M. Moore, Bd. of Edu., Dallas, Tex.

1282—Milnor, N. D.—Bids will be received by the Milnor School District until Aug. 23 for furnishing 50 tons of screened Youghiogheny soft coal and 10 tons of anthracite, bids not to include cost of delivery. Address Clk. H. K. Pennington, Bd. of Edu., Milnor, N. D.

+1283—Philadelphia, Penn.—The City Government may readvertise for bids to supply the Water Department until the close of the present year. While this contract has been awarded for the entire year, yet for the past three years, with a reform mayor in the saddle and a reactionary Council continually opposing him, the Council never appropriates sufficient money to meet the contract, so the law requires when all the appropriated money has been absorbed by deliveries that new bids be advertised for on a deficiency contract. Dealers then supplying coal on this new contract must await the pleasure of Council before receiving their money. It seems that such a method is certainly a hardship on the persons securing the contract in the first instance, but it has not yet happened that the deficiency contract has been awarded to any but the original contractor. However, there is no reason why such a contingency will not arise, and when it does it is also likely to be productive of a lawsuit on the part of the dealer who has his contract taken from him through no fault or failure on his part. Address Water Department, Philadelphia, Penn.

+1284—Council Bluffs, Iowa—Bids will be received by the Free Public Library until noon, Sept. 1, for coal to be delivered at the library building as may be required during the ensuing season. Address Librarian, Free Pub. Library, Council Bluffs, Iowa.

+1285—Bay City, Mich.—The County Government received bids until Aug. 20 for furnishing and delivering nut and steam lump coal for the courthouse heating plant as may be required during the ensuing year. Proposals are limited to the products of mines in Bay County. Address County Auditor, Bay City, Mich.

+1286—Fargo, N. D.—The Cass County Board of Commissions will receive bids until nooon, Sept. 8, for furnishing and delivering coal as follows: Anthracite nut and pea for the County Poor Farm, Pocahontas mine-run coal to be delivered at yard; same delivered at jail; Hocking Valley to be delivered in ton and half-ton lots; splint washed coal to be delivered in ton and half-ton lots; lignite to be delivered at courthouse; same f.o.b. yard at Fargo. Bidders should include scale charges, and all bids must be accompanied by certified check for $50. Address County Audr. Addison Leech, Bd. of County Comrs., Fargo, N. D.

+1287—Greensburg, Ind.—The Board of County Commissioners at this place will receive bids until Sept. 6 for furnishing from 75 to 100 tons of Youghiogheny coal. Address County Audr. L. W. Sans, Greensburg, Ind.

+1288—Sioux City, Iowa—Bids were received at the public library until 5 p.m., Aug. 20, for furnishing anthracite coal as may be required during the ensuing season. All bids were required to be accompanied by a check for 5 per cent. of the amount bid. Address Secy. Jeannette M. Drake, Pub. Library, Sioux City, Iowa.

+1289—Elmwood Place, Ohio—The Hamilton County Infirmary usually contracts some time in September for its annual requirements of coal involving approximately 1500 tons of smokeless mine-run. The business is let on competitive bids and the usual price is around $2.50 f.o.b. plant. Address Supt. Charles Weisbrod, Hamilton County Infirmary, Elmwood Place, Ohio.

+1290—Ellendale, N. D.—The Dickey County Board of Commissioners will receive bids until 2 p.m., Sept. 7, for furnishing approximately 200 tons of Youghiogheny mine-run coal to be delivered in the bins at the courthouse. Address County Audr. C. C. Misfeldt, Ellendale, N. D.

+1291—Joliet, Ill.—The Joliet Township High School Board received bids until noon, Aug. 19, for furnishing approximately 625 tons of Pocahontas mine-run and 40 tons of nut coal, to be delivered as required during the ensuing year. Proposals must be submitted according to a B.t.u. basis and must be accompanied by a check for $100. Address Clk. J. F. Skeel, Joliet Township High School, Bd. of Edu., Joliet, Ill.

+1292—Larimore, N. D.—The Board of Education received sealed bids until 8 p.m., Aug. 20, for furnishing 100 tons of Youghiogheny, Hocking, Pocahontas or lignite screened lump coal, to be delivered in the basement of the schoolhouse during the season beginning Sept. 15. Proposals should be submitted on the B.t.u. basis and accompanied by a check for $150. Address Clk. F. W. Reinoehl, Bd. of Edu., Larimore, N. D.

1293—Brinsmade, N. D.—The Riggin School District No. 4 received sealed bids until 2 p.m., Aug. 21, for furnishing and delivering one 40-ton car of Pocahontas smokeless lump coal in the basement of the public school house. Address Clk. F. W. Bowman, Riggin School Dist. No. 4, Brinsmade, N. D.

1294—Cuba, Ill.—The local School Board received sealed bids until 6 p.m., Aug. 20, for furnishing either mine-run or screened coal to be delivered in the local school building during the ensuing year. The successful bidder will be required to give a bond guaranteeing the faithful performance of the contract. Address Secy. R. V. Whitriah, Board of Education, Cuba, Ill.

+1295—Grove City, Penn.—The Grove City School Board will receive bids until Aug. 28 for furnishing coal as required during the ensuing year. Address, Secretary, Grove City School Bd., Grove City, Penn.

+1296—Alliance, Neb.—The Alliance school district received sealed bids until Aug. 20 for furnishing approximately 500 tons of lignite nut and egg coal (passing through a 4-in. bar or 6-in. round screen and over a 1-in. round screen). Bids should be submitted f.o.b. cars, or delivered in bins. Address Secy. F. W. Harris, Alliance School Dist., Alliance, Neb.

+1297—Bishop, Calif.—The Bishop Union High School will receive bids until 2 p.m., Aug. 28, for furnishing coal as required during the ensuing year. Address Clk. W. P. Teel, Bishop Union High School Trustees, Bishop, Calif.

+1298—Hannaford, N. D.—The local School Board will receive bids until Sept. 1, for furnishing 45 tons or more of Pocahontas coal to be delivered at the local school house. Address Clk. John Sad, Hannaford School Bd., Hannaford, N. D.

+1299—Columbus, Ohio—The Ohio Board of Administration, which has charge of more than a dozen Ohio charitable and penal institutions has asked for bids on Ohio mine-run coal for the Cleveland State Hospital up to 10,000 tons. The board has also asked for bids on 13,000 tons of either mine-run or three-quarter Ohio coal for the Columbus State Hospital. No time is set for the closing of bids. The coal is to be delivered on the switches of the institution at the request of the state board. Bids will also soon be asked for on the following amounts of Ohio-mined coal: Longview State Hospital, Cincinnati, 10,000 tons; Ohio Hospital for Epeleptics at Gallapolis, 10,000 tons; Mansfield Reformatory, 6000 tons; Delaware Girls Home, 3000 tons; Feeble Minded Institution at Columbus, 8000 tons; Toledo State Hospital, Toledo, 10,000 tons; Ohio Penitentiary, Columbus, 15,000 tons; Ohio Institution for the Blind, Columbus, 8000 tons; Institution for the Deaf and Dumb, Columbus, 6000 tons. Address Purch. Agt. R. V. Lyons, Ohio Board of Administration, Columbus, Ohio.

1300—Louisville, Ky.—The Louisville Gas & Electric Co. usually contracts some time during the current month for approximately 60,000 tons of pea and slack. Deliveries are made by railroad at the rate of 3100 tons per week. The coal is bought on a B.t.u. basis. Address Pur. Agt. Graham Davis, Louisville Gas & Electric Co., Louisville, Ky.

Contracts Awarded

Note—Successful bidders are noted in **bold face** type.

+746—Seattle, Wash.—This contract (Vol. 7, p. 917), which provides for furnishing the local Board of Education with approximately 8000 tons of coal, has been awarded on the following basis, which provides for furnishing and delivering the coal at the school building: **Pacific Improvement Co.,** Carbondale mine-run, $4.12½ a ton; **J. W. Bullock,** Reuton lump and nut, $3.85; **Durham Colliery Co.,** Durham lump and nut at $4. The city is divided into three districts and the companies will alternate on the business. Address Secy. R. W. Jones, Bd. of Edu., 347 Central Bldg., Seattle, Wash.

No. 966—Pineville, La.—This contract (p. 41), which provides for furnishing the Louisiana Hospital for the Insane, at this place, with its fuel requirements for the ensuing year, has been awarded to the **Birmingham Fuel Co.,** Birmingham, Ala., at $3.75 per ton delivered at Pineville; 1330 tons were purchased at this price. Address Supt. John N. Thomas, M. D., Louisiana Hospital for the Insane, Pineville, La.

+1007—New Castle, Penn.—This contract (pp. 77, 243), which provides for furnishing the local School Board with approximately 1800 tons of ¾-in. and 550 tons slack coal has been awarded to **F. G. Gano** at $2.19 per ton for the former and $1.75 per ton for the latter. The cost includes delivery in bins at the various school buildings. Address Secy. H. M. Marquis, School Dist. of the City of New Castle, North and East St., New Castle, Penn.

+1046—Two Harbors, Minn.—This contract (p. 116), which provides for furnishing the City Government with approximately 6000 tons of coal, has been awarded to the **Valley Camp Coal Co.,** Cleveland, Ohio, on the following basis: 1000 tons of Hocking, $2.25; 2000 tons of splint, $2.40; 2000 tons Youghiogheny screenings, $1.70; 1000 tons anthracite, $6.10. Address Light & Water Dept., Two Harbors, Minn.

1048—Middletown, Ohio—This contract (p. 116), which provides for furnishing the fuel requirements of the Colin Gardner Paper Co., aggregating approximately 50,000 tons of nut and slack coal per annum, has been awarded. No details are available at this time. Address Assist. Treas. M. S. Johnston, Colin Gardner Paper Co., Middletown, Ohio

+1054—Ottumwa, Iowa—This contract (pp. 116, 157), which provides for furnishing the local School Board with approximately 1600 tons of screened lump coal, has been divided equally between Styre Bros. and Dan Shea, both of whom bid 10⅜c. per bu. The business last year was let at about $2.70 per ton. Address Secy. J. A. Wagner, Bd. of Edu., Ottumwa, Iowa.

+1059—Toledo, Ohio—This contract (p. 116), which provides for furnishing the county government with coal, has been awarded as follows: **West Crescent Fuel Co.** for armory and court house, Pocahontas mine-run at $3.19; **Geo. M. Jones Co.,** for infirmary, Tropic Hocking ¾-in. lump at $2.10. Address Audr. Charles J. Sanzenbacher, Lucas County, Toledo, Ohio.

+1061—Mason City, Iowa—This contract (p. 116), which provides for furnishing the county institutions with approximately 1800 tons of coal, has been awarded to the **Independent Grain & Lumber Co.** on Wilmington, Ill., egg coal at a delivered price of $3.90 per ton. Address County Audr. Geo. E. Frost, Mason City, Iowa.

+1070—Ashtabula, Ohio—This contract (p. 117), which provides for furnishing the local Board of Education with approximately 100 tons of the best three quarter Pittsburgh coal to be delivered as required during the ensuing year, has been awarded to the **Ashtabula Coal Co.** Address Clk. Charles E. Peck, Bd. of Edu. Ashtabula, Ohio.

1086—Clinton, Mo.—This contract (p. 117), which provides for furnishing the County Government with coal has been awarded as follows: **Docherty Fuel Co.,** screened lump to be delivered at the court house and jail, $3.37½; **M. E. Lane,** screened coal for the county hall, $2.37½. Address Deputy Thornton Jennings, Clinton, Mo.

+1088—New York, N. Y.—This contract (pp. 117, 198), which provides for furnishing the Department of Bridges with about 200 tons of No. 1 buckwheat, has been awarded to **Burns Bros.,** who were the lowest bidders at $1637.50. Address Bridge Comr. F. J. H. Kracke, Municipal Bldg., New York City.

+1093—Franklin, Penn.—This contract (p. 117), which provides for furnishing the City Government with approximately 2400 tons of three-quarter lump coal, has been awarded to the **Mercer Iron & Coal Co.,** of Stoneboro, Penn., at $1.68 per ton. Address City Clk. J. G. Crawford, Franklin, Penn.

1096—Kansas City, Mo.—This contract (p. 157), which provides for furnishing Montgomery, Ward & Co. at this place with approximately 6000 tons of Cherokee mill coal, has been awarded to the **J. H. Leonard Coal Co.** Address Pur. Agt. H. R. Lipton, Montgomery, Ward & Co., Kansas City, Mo.

1102—Beaver Falls, Penn.—This contract (p. 157), which provides for furnishing the schools of North Sewickley Township with coal, has been divided equally between **B. Wiley** and **W. Dougles**, both of whom bid 10c. per bu. for lump and 5c. per bu. for slack coal. About 1600 bu. will be required altogether. Address Secy. S. O. Swick, Beaver Falls, Penn.

1121—Springfield, Ill.—This contract (p. 158), which provides for furnishing the fuel requirements of the various state charitable institutions has been awarded as follows:

Institution	Contractor	Coal	Ash	B.t.u.'s	Tons	Price: Per Ton	Price: Per Million B.t.u.'s

Address Illinois State Board of Administration, Springfield, Ill.

Contract Notes

Toledo, Ohio—The Board of Public Safety has awarded a contract for 500 tons of Kanawha gas coal for use at the workhouse.

Minot, N. D.—The contract to furnish coal to the Minot School district was awarded to **L. D. Colton,** of Burlington, at $2.45 per ton.

France—Press reports are to the effect that Dr. Arnaud Rosenthall, representing the French Government, is at Pittsburgh negotiating the purchase of more than 3,000,000 tons of bituminous coal.

Dayton, Ohio—The contract to supply 300 tons of Smithers Creek coal to the Memorial Building, has been awarded to **J. D. Whitmore,** at $2.50 per ton delivered. Nine other coal dealers submitted bids.

Spain—An American consular officer in Spain writes that a business man in his district desires to represent American exporters of coal. New York City references given. Correspondence should be in Spanish.

Switzerland—An American consular officer in Switzerland reports that an association in his district desires to communicate with American producers and exporters of coal. Specifications, etc., may be had on application to the Bureau of Foreign and Domestic Commerce or its branch offices.

West Indies—An American consular officer reports that a West Indian railway purchasing about 600 tons of patent fuel per year wishes quotations on lots of 100 and 200 tons. It is stated that the fuel must be free burning and that it must not clog the grates. Quotations should be made c.i.f. destination.

Bellefontaine, Ohio—The School Board has let contracts for the coal supply for the coming year as follows: Silver Lake Ice & Coal Co., 200 tons of splint, lump, at $2.98; Kerr Bros., 100 tons Pocahontas mine-run at $3.05; Bloom Bros., 200 tons of Pocahontas mine-run at $2.85, and 50 tons of Kentucky block at $2.85.

Du Quoin, Ill.—The Blakeslee Mfg. Co., at this place, consumes about 1000 tons of 1-in. screenings per annum. Deliveries are by railroad at the rate of one or two 50-ton cars per month. The coal is bought from local mines. Address Pur. Agt. E. T. Blakeslee, Blakeslee Mfg. Co., 235 N. Chestnut St., Du Quoin, Ill.

Chile—The chief engineer of a gas company in Chile has informed a commercial attache of the Department of Commerce that he desires to obtain samples of the best American coking coal. The commercial attache has transmitted a report on this opportunity which may be had on application at the Bureau or its branch offices.

Erie, Penn.—The contract for furnishing the local Fire Department with coal during the ensuing year (p. 200) has been divided equally among the following companies, all of whom bid $5.15 for No. 4 anthracite delivered: Burnwell Coal Co., Meyer Coal Co., Mutual Coal Co., Wittmann-Pfeffer Co., Guelcher Bros., Saltsman Coal & Supply Co., Erie Coal Co. Address Clk. J. H. Callaghan, Director of Public Safety, Erie, Penn.

Helena, Mont.—Contracts for furnishing the State Institutions with coal during the ensuing year have been let by the State Board of Examiners as follows: Northwestern Coal Co., 8400 tons; International Coal Co., 6775 tons; Union Pacific Coal Co., 800 tons; Roundup Coal Co., 720 tons. Other bidders on the contracts were C. W. Scott, Montana Coal & Iron Co., National Fuel Co., Nelson Fuel Co., Interstate Lumber Co., C. H. Vourk and Wyoming Coal Co.

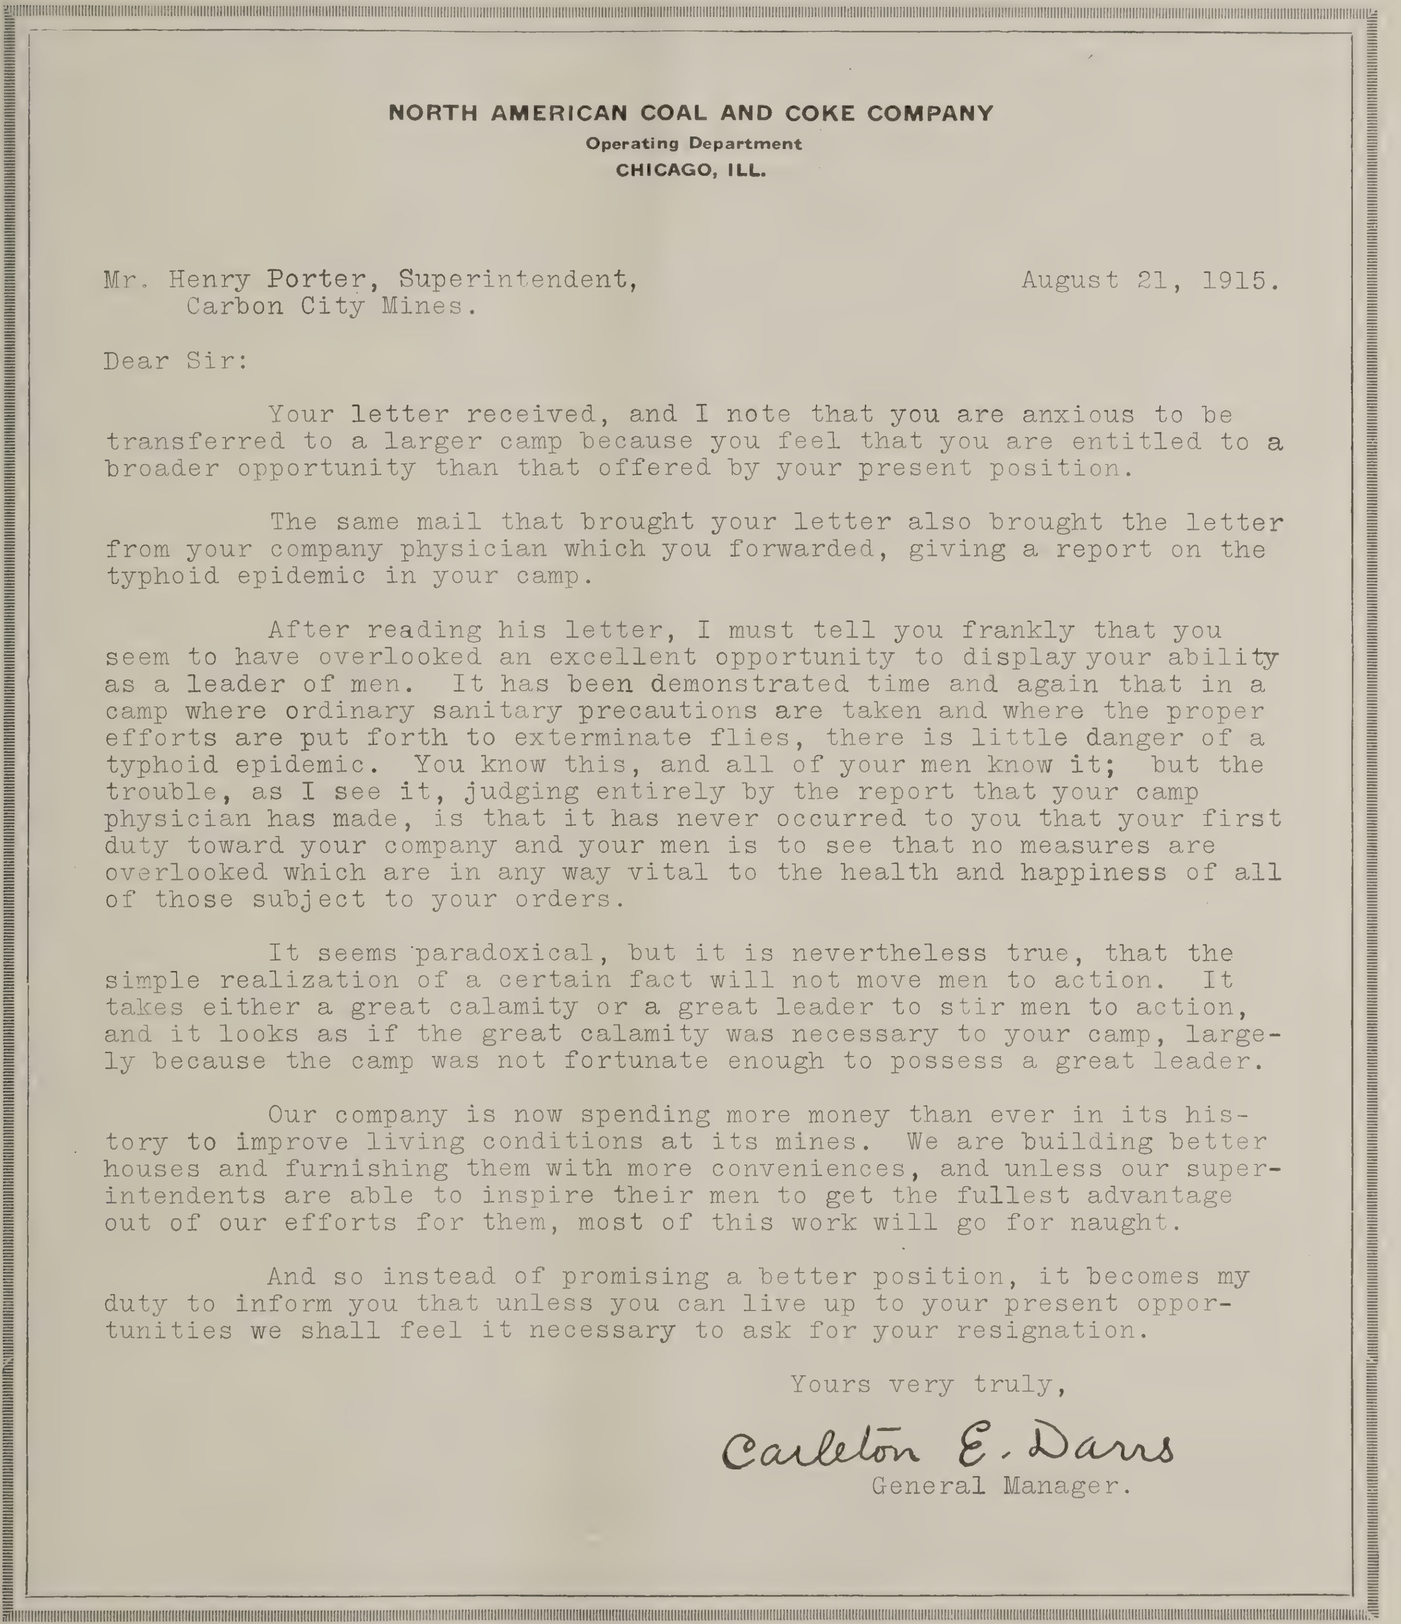
Sioux Falls, S. D.—Contracts for furnishing the local Board of Education with coal for the coming year were awarded as follows: **Schoeneman Bros.** (anthracite), $10.55; **Sioux Falls Fuel Co.** (bituminous), $6.75. Other bidders were: Schoeneman Bros. (bituminous), $6.85; Sioux Falls Fuel Co. (anthracite), $10.64; H. T. Parmley (anthracite), $10.65 (bituminous), $6.80; W. A. Mills (anthracite), $10.78 (bituminous), $6.89; W. Z. Sharp Elevator Co. (anthracite), $10.74 (bituminous), $6.79; Loonan Lumber Co. (anthracite), $10.65 (bituminous), $6.96.

Fort Worth, Tex.—After receiving and tabulating bids for coal for the city schools of Fort Worth for the coming year, the School Board decided to burn gas for heating the school rooms. Bids on coal were received from Hefley-Coleman Co., the Tri-State Coal Co. and C. H. Lilly, all of Ft. Worth; and W. E. Melton Co., of Bridgeport, Tex. These included bids on a new brand of coal, known as the Arkansas semianthracite, which it was represented had given excellent service.

Dallas, Tex.—Contract for supplying 1000 tons of coal for the public schools was awarded to the **Fidelity Fuel Co.,** of Muskogee, Okla., at $2.50 per ton f.o.b. the mines. Other bids were: Penniman Coal Co., McAlester domestic lump, $3.70; Wilburton, domestic lump, $3.20; Henryetta or Dewar domestic lump, $2.75; Greenwood fancy domestic lump, $2.50; Greenwood domestic lump, $2.50; Pulliam Fuel Co., McAlester domestic lump, $3.70; Wilburton domestic lump, $3.20; Dewar domestic lump, $2.75; Arkansas domestic lump, $2.50; Greenwood screened nut, $2. Western Coal & Mining Co., Arkansas fancy lump, $2.50. Green Ridge Coal Co., Green Ridge or Dewar domestic lump, $2.50. McAlester Fuel Co., McAlester domestic lump, $3.70; Wilburton domestic lump, $3.20; McAlester fancy nut, $3; Wilburton fancy nut, $2.75; Guntheur-Greenwood nut, $1.75; Guntheur-Greenwood semianthracite, $1.80; Dewar machine-mined domestic lump, $2.75; Dewar machine-mined fancy nut, $2.50; Guntheur-Greenwood machine nut, $2; James A. Lincoln, Henryetta or Dewar domestic lump, $2.60; Union Coal Co., domestic lump, $2.25. Central Ice & Cold Storage Co., machine-mined domestic lump, $2.50; machine mine-run, $1.75. The board decided to buy 800 or 1000 additional tons of coal on the open market. Address Secy. C. M. Moore, Board of Education, Dallas, Tex.

COAL AGE

Vol. 8 NEW YORK, AUGUST 28, 1915 No. 9



NORTH AMERICAN COAL AND COKE COMPANY
Operating Department
CHICAGO, ILL.

Mr. Henry Porter, Superintendent,
Carbon City Mines.

August 21, 1915.

Dear Sir:

Your letter received, and I note that you are anxious to be transferred to a larger camp because you feel that you are entitled to a broader opportunity than that offered by your present position.

The same mail that brought your letter also brought the letter from your company physician which you forwarded, giving a report on the typhoid epidemic in your camp.

After reading his letter, I must tell you frankly that you seem to have overlooked an excellent opportunity to display your ability as a leader of men. It has been demonstrated time and again that in a camp where ordinary sanitary precautions are taken and where the proper efforts are put forth to exterminate flies, there is little danger of a typhoid epidemic. You know this, and all of your men know it; but the trouble, as I see it, judging entirely by the report that your camp physician has made, is that it has never occurred to you that your first duty toward your company and your men is to see that no measures are overlooked which are in any way vital to the health and happiness of all of those subject to your orders.

It seems paradoxical, but it is nevertheless true, that the simple realization of a certain fact will not move men to action. It takes either a great calamity or a great leader to stir men to action, and it looks as if the great calamity was necessary to your camp, largely because the camp was not fortunate enough to possess a great leader.

Our company is now spending more money than ever in its history to improve living conditions at its mines. We are building better houses and furnishing them with more conveniences, and unless our superintendents are able to inspire their men to get the fullest advantage out of our efforts for them, most of this work will go for naught.

And so instead of promising a better position, it becomes my duty to inform you that unless you can live up to your present opportunities we shall feel it necessary to ask for your resignation.

Yours very truly,

Carleton E. Davis
General Manager.

Why He Was NOT Promoted

Ideas and Suggestions

"Preparing" for Better Times

By Pennsylvania Engineer

Mr. Boss, how do you size up? In the language of the trapper boy, Are you there? We are on the eve of better times. You have been inspecting the plant, noting what improvements and additions are necessary to meet this change. You have placed a new piston in the hoisting engine, put in a large-size discharge line from the big pump, repaired the headframe—everything looks in tiptop shape now, and you are feeling mighty good and ready to put out more coal than ever before.

But—hold on, you are not through yet! How about yourself? Are you in tiptop shape to meet this business? You don't know as there is anything the matter with you? Well, just give yourself the "once over" and see. You have often found that you have misjudged a man and that he has good qualities of which you never dreamed. Now, there is no danger of you misjudging yourself in this manner. A man's opinion of himself is likely to be very much sugar-coated, so forget for awhile how good you are and sit down and ask yourself a few questions.

Are you still a man of your word? Do the men look up to you and respect you? Have you control of your temper? Have you contracted any bad habits? Are you next to all the new mining wrinkles and new types of machinery?

Now, if you are honest in your examination you will surely find some defect in your makeup—something that you can remedy or improve.

Fulfill All Promises

If you have got into the habit of making promises to your men and not fulfilling them, you had better cut it out. If you do not have the regard of the men, you had better get it in a hurry. Miners are going to be scarce and the boss who appreciates his men will be the one who will have his plant running full when prosperity hits us.

If you have not read up on new methods and new machinery, you had better "get next" or some other fellow will have your job. Better be sure that your health is good. A sick man is only half a man.

Analyze yourself, find your faults, and you will become a better man.

The fellow that knows himself—knows his strength, knows his weakness—is the fellow who gets there.

⁂

The "Big Boss"

By Forney L. Parker

The claim is made that coal companies are soulless and heartless and that the employees are mere cogs in a big industrial machine, to which less consideration is paid than to the rough iron or steel itself. It is the duty of the man who directs the aims and purpose of the company in the field—the manager, the superintendent, the "big boss"—to dispel this piece of fiction.

By giving attention to your employees' grievances, showing an interest in their work, in many cases calling them by their first names and by having their welfare and safety at heart, you get them to think and to have confidence in themselves and in the company. It is a tangible incentive to do good work.

I remember an employee—I will call him "Eddie Malone," which is not his name—who was directed by the foreman one morning to perform a certain task. In giving his instructions the foreman unthinkingly called him "Malone," whereas his usual way of addressing him was "Eddie." This set Eddie thinking, which is very good for one provided he is on the right track. In this case, however, the miner thought the boss had started to call him by his surname preparatory to sacking him. In fact Eddie was so busy asking himself why, that he did not have much time for the work at hand.

I merely relate this incident to illustrate the importance of giving your full measure of consideration to the man who works for you, whether he is trapper-boy or your first assistant. If the company has a soul, a high ideal, a definite purpose, you, more than anyone else, are duty bound to convey this spirit to your employees.

This attitude of the "big boss" will be reflected by his lieutenants—men who have charge of important divisions of work and who carry out his directions; and it will do much toward creating a human machine of which all the essential parts will work together in perfect harmony.

⁂

A Plea for a Better House

I am a hoisting engineer. All my life I have lived in company houses, in the summer to roast and in the winter to freeze. While single I did not mind these conditions; in fact, I never thought of them as hardships.

But now I am married and have a family of three. I am proud of them and would like to provide a pleasant and comfortable home. We would like to have flowers around the house and a nice big garden. We would like to have a kitchen and—yes, a bathroom in this house of ours; for we get as dirty as anyone—perhaps a little more, living in a coke town.

Can you tell me where I can find such a place? I have been looking for several years, but so far have not been successful in locating one.

My present house is as good as any in the town where we now live. They are all alike. Most company houses are. Of course, they are just about what our foreign neighbors want, but how about us Americans? Our house contains four rooms—two on the first floor and two on the second. We have to cook and eat in the same room—pretty hot this warm weather. We have tried to raise flowers and vegetables on our little piece of ground, but the houses are set so close together that the sun can never see our plants. Winter will soon be here again, and then in spite of our big coal stoves our house will again always be cold, like it was last winter. Pretty tough on the kids.

I believe I am a good workman. I make good wages and like my work. If I just had that home now, I would be perfectly satisfied. We pay $7 a month for our house. How glad I would be to pay $10 or $12 for one like I have in mind. It might cost a few hundred dollars more to build, yet I would willingly pay the interest-difference in rent.

We would feel like we had a home then and would be contented. Can you tell me where I can find the opportunity to realize my modest desire?

Facts Worth Considering

By J. J. Roby

Our laws protect the consumer against extortion on the part of the producer, but they do not protect the producer against the folly of his competitors.

Because of certain hazards not present in other lines of business, the coal operator is entitled to a larger measure of profit than men engaged in most other industries.

The coal operator, unlike the manufacturer, must at once acquire sufficient raw material to operate a long period of years. Furthermore, the mine owner, because of constant depletion of coal and rapid depreciation of plant, cannot keep his property intact.

The method of cost accounting in use at any mine should enable the operator to accurately determine the cost of conducting his business, which should include a reasonable profit, and to continue the operation at a profit until all the coal is mined.

The cost of production, if properly computed, will indicate about the same selling price for coal of similar grades, regardless of ownership, magnitude of operation, probable duration of operation and physical conditions.

When the coal operator sells coal at less than cost, in order to keep his mine running, he simply disposes of a portion of his property without compensation.

When the operator sells coal at a low price, because his mine is new and his primary cost low, he suffers a loss even though he believes he is making a profit.

The operator, to make good, must earn sufficient during the earlier years of his operation to amortize a large part of his investment and reduce his interest charge.

A tract of 10,000,000 tons of coal that cannot be mined at a primary cost and marketed at a selling price to permit an initial royalty of 12c. cannot have an average value of 6c., nor can it all be mined at a fair profit.

The primary cost of operation is represented by actual expenditures made in the ordinary course of operating but should not include interest or payments on borrowed capital.

The secondary cost of operation consists of proper charges against the product for plant depreciation, coal depletion, interest on investment and capital, risk of the industry and a reasonable profit.

The proper selling price is the sum of the primary and secondary costs.

The secondary cost, or margin between selling price and primary cost, of a standard grade of coal of the best quality and with the most favorable physical conditions, determines the basic value for coal of that grade, the value being modified as adverse physical conditions increase primary cost and as poorer quality reduces the selling price.

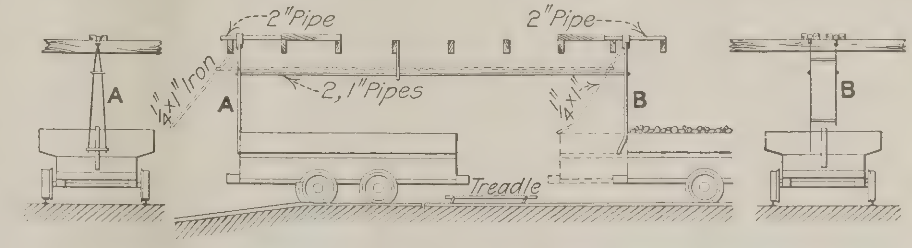
An End-Gate Lifter

By A. W. Hesse[*]

A simple arrangement in connection with a Phillips crossover dump for automatically lifting the end gate of a mine car while dumping is shown in the accompanying drawing. This arrangement is now in operation on the tipple of the Lincoln Coal Mining Corporation, at Big Creek, W. Va.

The equipment consists of three short 2-in. pipes, two 15-ft. lengths of 1-in. pipe, three pipe straps, separating pipes and bolts, and four pieces of strap iron ¼x1 in. about 5 ft. long.

The loaded car moving toward the dump strikes the arm *B* and in raising it moves the arm *A* away from the stirrup on the end gate of the empty car by means of the two 1-in. pipes connecting *A* and *B*. The arm *B* drags over the top of the loaded car, holding *A* out of the way until the loaded car bumps the empty off the dump. Then before the loaded car reaches the horns of the dump these arms drop back to their vertical positions, and *A* is ready to catch the stirrup of the loaded car when it is dumped.



DETAILS OF APPARATUS FOR LIFTING END GATES ON MINE CARS

These arms extend about 8 or 10 in. below the top of the car. While the sketch does not show it, the arm *A* is about 5 in. behind the front of the car to assure catching the stirrup of the end gate when the car is ready to dump.

The material in this apparatus is all comparatively light so that only the one rod *B* is necessary to extend below the top of the car, thus avoiding dragging over the loaded car.

The distance between the arms at the dump at Big Creek is 15 ft., leaving a space of 6½ ft. between the ends of the cars when the arms begin to lift. This distance of course may be varied, depending upon the length of the cars. Care should be taken to avoid placing the arms too close together in order that the loaded car shall not get too close to the dumping point before the front arm is in position to catch the stirrup of the end gate.

* * *

The Thicker Coal Seams Will Become Scarcer, and this day is fast approaching. Then will come the turn for the thinner seams. Joseph Dickinson estimates that in half a century many of the thick seams in Europe and America will be completely worked out, and coal will sell at a much higher price. Operators will then find it possible to work the thin beds.

---

[*] Big Creek, W. Va.

Allegheny River Mining Company's Cadogan Mine

By Fred Norman*

SYNOPSIS—At this mine three coal beds will be simultaneously worked, all the coal being handled in one preparation plant. This plant is so arranged that any combination of prepared sizes from any or all of the coal measures may be loaded on the railroad cars.

The Allegheny River Mining Co., of Kittanning, Penn., is opening a new mine on the west bank of the Allegheny River in North and South Buffalo Townships, Armstrong County, Penn., known as Cadogan mine. This is the sixth large coal-mining operation of that company along the line of the Pittsburgh & Shawmut R.R., between Brookville and Freeport, Penn., and when fully developed will give the company a total output of 15,000 tons per day.

The Cadogan plant is beautifully located on an extensive flat on the Allegheny River, with the tipple yard parallel to the main track of the Pittsburgh & Shawmut R.R. Both the railroad and the mining plant are now in course of construction, and work is being pushed with the expectation of shipping coal in the fall of 1915.

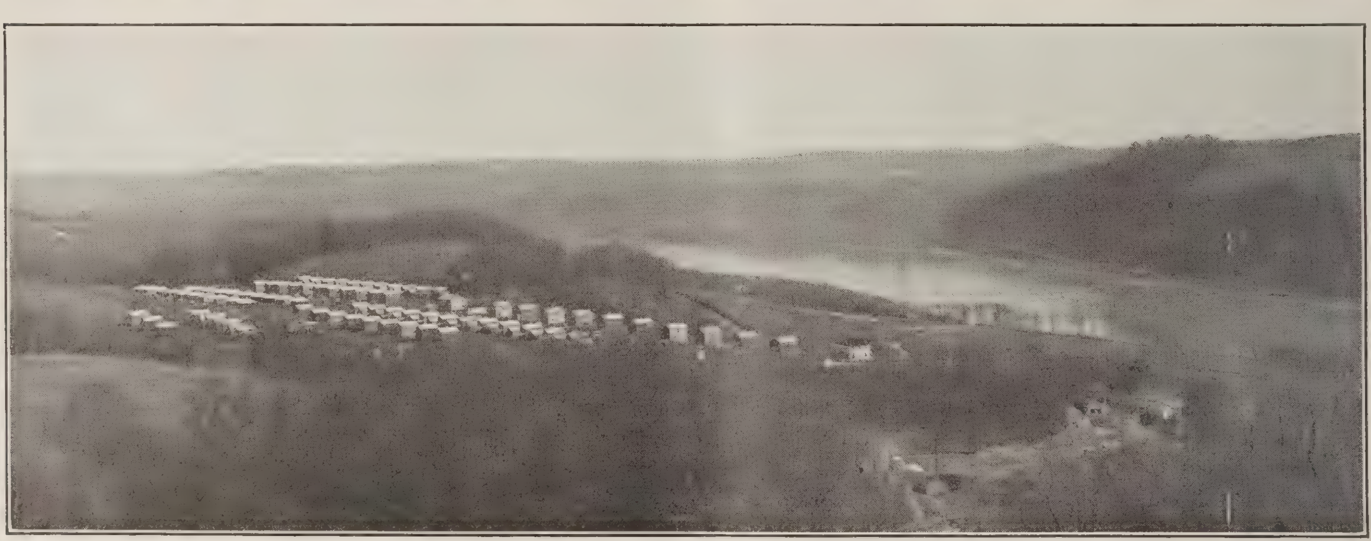
A large coal territory is tributary to this plant, and drifts are opened in three veins, which in this particular section are all of workable thickness. The principal workings will be in the Lower Kittanning, or "B," vein, while extensive operations will be pushed into the Lower Freeport, or "D," and the Upper Freeport, or "E," seams. The thickness of coal in either vein averages 42 in. with a maximum of 60 in. The "B" vein lies about 40 ft. above the normal river stage, with an interval of about 250 ft. between it and the "D," which lies about 45 ft. below the "E" seam.

The "B" seam crops full thickness on the river front, and by diamond-drill testing proves to be uniform for miles. The two Freeport veins, however, are not so regular and thin out on the edges in all directions from the body of the seams, thereby somewhat limiting the points of favorable attack to an area parallel with and about a mile back from the river. The territories covered by the Freeport veins are irregular in shape and less in area than the "B" vein, but of such magnitude as to warrant large operations in both measures.

The mine workings are laid out on the "pillar and room" system from double room entries. Main entries are driven four abreast, two haulage in the center and one airway on each side. Face entries are driven off the mains at regular intervals, forming panels of from 30 to 40 rooms off each room entry.

Superimposed Entries Will Be Employed

The two Freeport seams will be worked with entries directly above one another, while the "B" seam will be worked independently, inasmuch as the interval between it and the "D" seam is about 250 ft., composed of several sandstone and sandshale strata, not likely to cause any disturbance in the upper veins from subsidence in the lower. Furthermore, an attempt will be made to keep the upper workings ahead of the lower, since these have a mile handicap at the start. The coal in all three veins is of excellent structure and quality, with favorable roof and floor conditions.



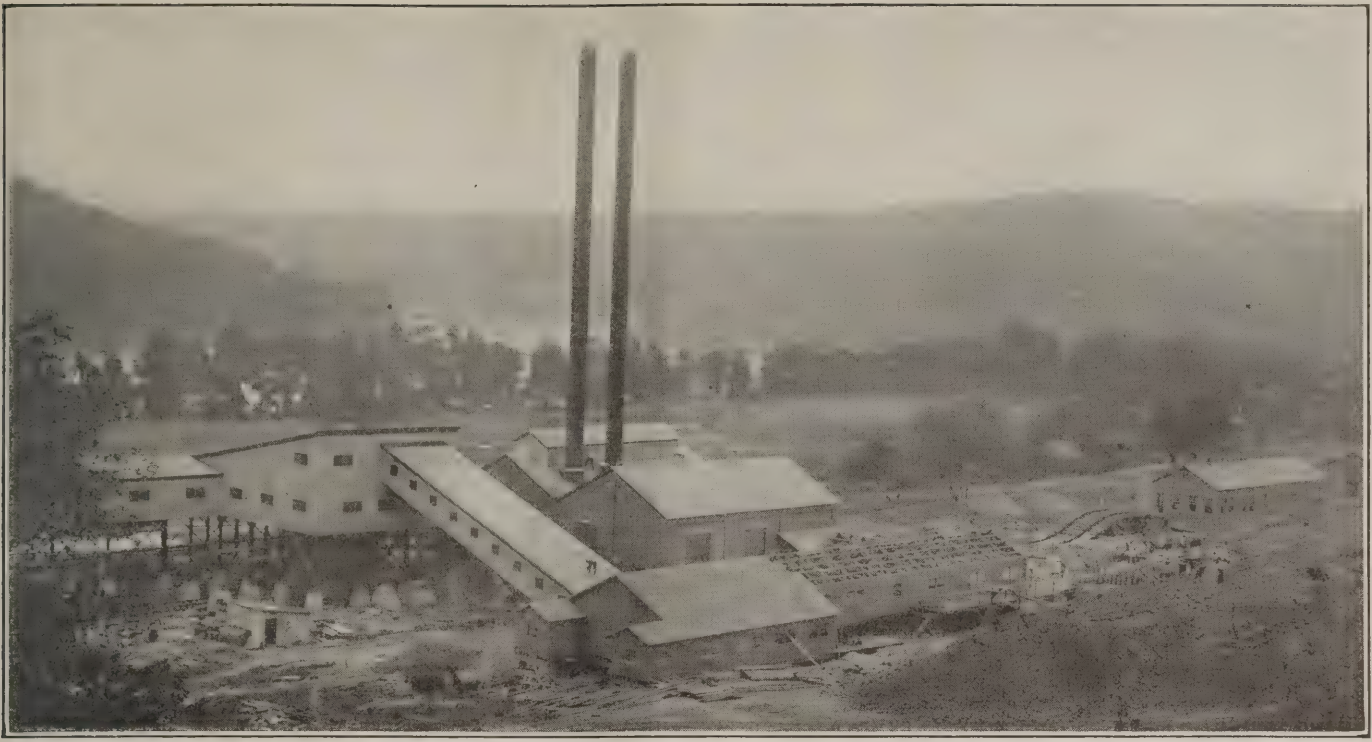
THE TOWN, LOOKING EAST, WITH ALLEGHENY RIVER IN BACKGROUND

Coal will be mined by Sullivan shortwall electric machines, and hauled by General Electric locomotives. The mine will be ventilated by electrically driven fans and unwatered by electrically driven pumps.

The yard tracks of the railroad are on approximately the same level as the main double-track drift in the "B" vein, necessitating the elevation of the coal to screening height above the railroad cars. To overcome this it was decided to tipple the coal on the level of the ground and elevate it to the screenhouse by apron conveyors.

---

*Chief Engineer, Allegheny Mining Co., Kittanning, Penn.



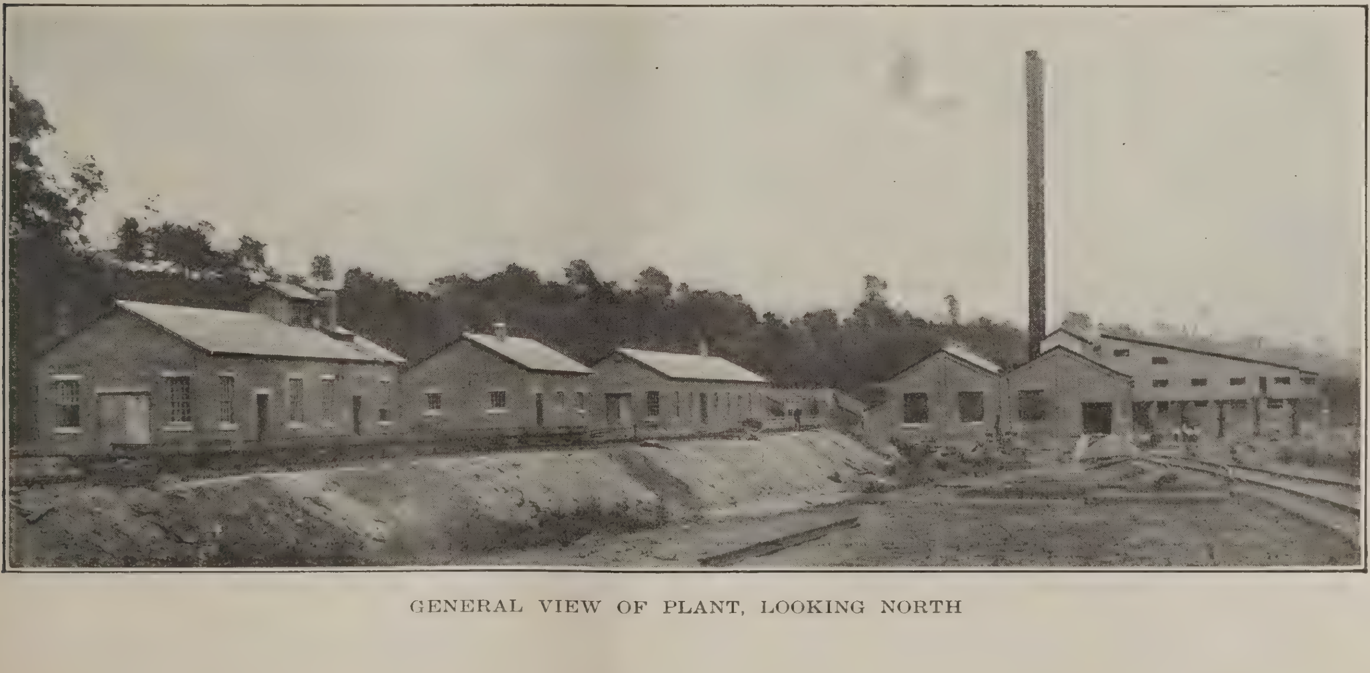
GENERAL VIEW OF PLANT, LOOKING EAST

The coal from all three beds will be delivered by locomotives to a low tipple, having two Phillips crossover dumps, two feeder car hauls, two Dempcy-Degener automatic car stops and two Standard platform scales. The locomotives will head trips in on the tipple floor, cut loose and switch over to the locomotive return track, which passes under the tipple floor. This gives the locomotives a clear track to the intersection with the empty tracks, ahead of empty cars. The trip meanwhile travels slowly ahead until engaged by the feeder carhaul, which moves the trip at will so as to place one car at a time on the scale platform. Here it is uncoupled, weighed and pushed off the scales by the next succeeding car, actuated by the carhaul.

The cars after leaving the scales run by gravity to the car stops, which hold them till released by the dumper, by means of a foot lever. Three to four cars can be held in the stops, which close automatically after each release. Coal is dumped into hoppers holding 10 to 12 cars, the bottoms of which open onto reciprocating electrically driven feeders delivering the coal to the main conveyors.

The empty cars after passing over dumps run by gravity to switchbacks and return by gravity under the tipple floor to electrically driven trip makers, which elevate them about 10 ft. and push the empty trips along tracks with a ½ per cent. grade in favor of the cars.

The coal is fed by reciprocating feeders to two apron conveyors, electrically driven, with capacities of 300 tons per hr. each, elevating it to the top of the screenhouse, where it is delivered to shaking screens of the flanged-lip type, sizing the coal into lump, nut and slack. The



GENERAL VIEW OF PLANT, LOOKING NORTH

lump, lump and nut, or run-of-mine is delivered to picking tables, at right angles to the screens, terminating in adjustable electrically operated loading booms delivering to railroad cars.

Nut coal is carried from the screens by a transverse flight conveyor delivering directly to the nut car or to another flight conveyor carrying it to the picking tables, as desired. This last conveyor, on its return course below, carries refuse from the picking tables to a crusher or to the refuse bin. This conveyor is partitioned off in the center, one side delivering to either crusher or bin and the other side to the bin only. Dirty coal, bone, etc., goes to the crusher, from which it is taken for fuel to the boilerhouse by a small flight conveyor.

The bin opens with a gate at the bottom into a mine car on a track constructed for the purpose, and all rock, pyrites, slate and other hard or incombustible matter is removed for ballast or deposited on the waste dump.

Any Combination of Sizes May Be Loaded

Provision is made for loading lump, nut, slack, run-of-mine, lump and nut, and nut and slack, while emergency chutes at the head of conveyors allow loading run-of-mine without passing the coal over the screens. Coal is loaded on four tracks under the screenhouse. Two are equipped with loading booms for lump, lump and nut, or run-of-mine; the other two, for nut, nut and slack, and slack, have no booms. Each loading track will be equipped with Fairmont car retarders, for handling the cars under the screenhouse.

The screenhouse is a steel structure covered by corrugated iron on roof and sides. Machinery is run by 220-volt alternating-current induction motors. The tipple building is of wood with corrugated asbestos-covered iron roof and sides. The screenhouse, with all its machinery and apparatus, and all the machinery in the tipple were erected and furnished by the Link Belt Co., while the tipple building was erected by the mining company.

SCREEN HOUSE AND POWER HOUSE, LOOKING NORTH

Power will be derived from two 375-kv.-a. General Electric 2300-volt three-phase 60-cycle alternators direct-connected to two horizontal sidecrank nonreleasing corliss-valve steam engines built by the Ball Engine Co. Provision is also made for the later installation of a mixed-pressure turbine to be run by exhaust steam from the engines. The electric units, with the switchboard, etc., together with the 10-ton hand-operated crane, are located in one-half of the powerhouse. The other half contains two Heine safety watertube boilers of 470 hp. each, generating steam at 150 lb. pressure and equipped with six Jones underfeed stokers. Provision is made for the installation of an additional boiler in the same compartment.

Ashes will be dropped through trap doors in the floor into steel cars in the pit beneath. One 1500-hp. Cochran open feedwater heater receives water from a tank outside of the building, and the heated water is delivered to boilers by two American steam plunger feed pumps. The water supply is derived from two 10-in. drilled wells inside the boiler house in the rear of the heater. The water is lifted and delivered to the tank by two American steam-driven deepwell pumps. It gravitates from the tank to the heater.

Engines and boilers, with apparatus and accessories, are located in a brick powerhouse building built on concrete foundations. This building has a steel-trussed red asbestos-shingle covered roof and concrete floors. Two steel stacks 56 in. in diameter and 140 ft. high above the floor rise through the roof. This building was erected by the McClintic-Marshall Construction Co. and lies in an angle formed by the tipple and screenhouse.

Power will be distributed for the present to two substations, one at No. 1 drift in the "B" vein workings and one at No. 3 drift in the "E" vein workings. This latter for a time will serve workings both in "E" and "D."

Three-phase 60-cycle 2300-volt alternating current will be taken from the switchboard to a steel distribution tower outside the powerhouse. This tower will be 25 ft. high and will contain three Pittsburgh 75-kv.-a. 2300/220-volt single-phase transformers for the tipple and screenhouse motors and the general lighting of the plant, and reactors or choke coils and lightning arresters. Three separate circuits will be led from the switchboard to the tower, with provisions for a fourth. The main power circuit consists of three No. 3 bare copper wires to supply the substations, while three No. 6 bare copper wires for ventilating fans will be supplied from a separate circuit from the switchboard. All high-tension lines are carried on wooden poles, with a minimum height from the ground of 25 ft. A No. 6 galvanized-iron static wire is carried on top of the poles, with grounds at every fifth pole. The poles are spaced 100 to 200 ft. apart, according to the contour and conditions of the ground.

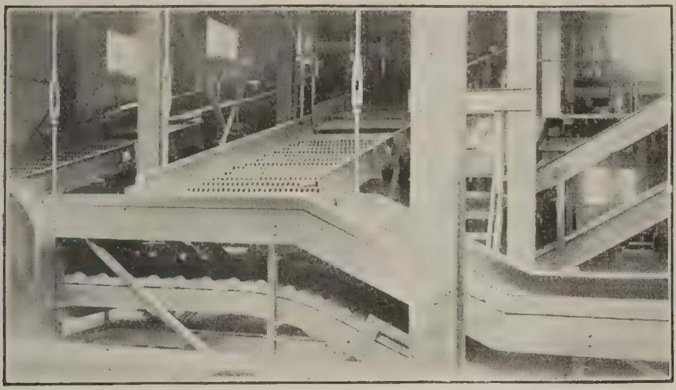
The substations are each equipped with 200-kw. synchronous motor-generator sets, with necessary switchboards, etc., and 2300-volt alternating current will be converted to 275-volt direct current for general power use. No. 1 substation has General Electric equipment, while No. 2 is a Ridgway installation. The substation buildings are brick on concrete foundations, with red asbestos-shingle roofs. Power from the substations is distributed inside and outside over No. 0000 grooved trolley wires.

Two-Speed Motor Is Used for Fan Driving

The lower mine will be ventilated by a 7-ft. Robinson fan, driven by a 150-hp. two-speed Crocker-Wheeler induction motor, and housed in a brick building with concrete foundations and roof. The fan is placed at the mouth of the air drift and has a capacity of 150,000 cu.ft. per min. at 3-in. watergage. No. 3 drift in "E" vein is to be ventilated by an 8-ft. Stine disk fan, driven by a 40-hp. Crocker-Wheeler induction motor, while the "D" vein workings will temporarily be taken care of by a 6-ft. Robinson disk fan driven by a General Electric 25-hp. 250-volt direct-current motor. All fans have Link Belt silent chain drives.

Coal from the upper workings—in the Freeport veins—will be hauled by electric locomotives to he head of a

1200-ft. incline gravity plane, equipped with a Stine figure-8 plane machine. The cars will be handled by disappearing "barneys" to the foot of the plane near No. 1 drift in "B" vein and into the common yard for all coal, from where they will be delivered to the tipple by electric locomotives. Product from the "E" vein will pass over a tramroad with 2 per cent. grade in favor of the loads to the head of the plane, while the "D" vein product will be hauled over a tramroad with 2½ per cent. grade against the loads, in order to reach the yard at the head of the plane.



VIEW INSIDE SCREEN HOUSE

The arrangement of tracks in the yard and tipple allows the keeping of the coal from the different workings separate, if so desired.

All tracks on main haulage roads are laid with 40-lb. steel rail, 30-lb. in side or room entries and 16-lb. in rooms, the latter being laid on Fairmont steel ties. The gage of the track is 42 in.

Eight-ton electric locomotives will do the hauling at the start; heavier types to be added later if necessary. Wooden mine cars are employed which are built in the company's shops at Furnace Run mine. These are of the single-bumper four-belted type, holding 3000 lb. of coal level full.

Along the yard tracks between the tipple and No. 1 drift are located the necessary mine buildings. The office and supply house, sand and oil house, repair shop and motor barn, in addition to the power house mentioned, are erected near the tipple, while near the mouth of No. 1 drift are the first-aid hospital and the mine foreman's office, in addition to No. 1 substation and fan house. All of these structures are of brick on concrete foundations and with red asbestos-shingle roofs. The mine foreman's office, the repair shop and the motor barn will be erected shortly along the tramroad to the upper or Freeport vein workings.

A mining town of 80 tenements, constructed by the Nicola Building Co., together with a superintendent's residence, hotel, doctor's office, etc., are built, with provisions made for extensions from time to time as needed, on a hill overlooking the river and the works. The town is laid out with streets and alleys, and reservations are made for schools, churches, stores and playgrounds. Waterworks supplying the town will be installed, the supply to be derived from drilled wells, with electric pumps and a 50,000-gal. tank high enough to insure good pressure. Four-inch cast-iron mains with 3-in. and 2-in. auxiliaries will distribute the water through the town. Fire plugs and hydrants will be erected at convenient points.

Construction work is still in progress, and although the larger part of the work is completed or nearing completion, much is still to be accomplished. The object is to get the mines in working condition for an output of about 500 tons per day this coming fall and gradually complete construction, along with the mine development, till the rated output of 5000 tons per day is reached.

⁂

Opening South-China Coal Fields

There is a very fair prospect for the development of some of the coal fields of south China, says Consul General George E. Anderson in *Commerce Reports*, especially within Hongkong's trade territory, on a modern basis. At several localities along the West and North Rivers near Canton coal fields have been worked in native fashion for some time and the output has come to amount to a considerable volume.

An American mining expert has had occasion to look into one of these fields in the past few weeks, with a view to development along modern lines, and gives some facts of interest. The property examined is situated on the North River, about 160 miles from Canton, the actual mine being located about a mile from the river and on the right bank. The survey for the Canton-Hankow Ry. lines crosses the property which occupies broken ground, embracing two lines of hills of considerable height. The native workings are located from 800 to 1000 ft. up the side of one of these ranges and the seam has been followed down for about 400 ft. The seam runs about 9 ft. in thickness.

The native method of working is extremely wasteful and also extremely dangerous, even where the seam is as plainly exposed as it is in the case of the one worked. On this property there are three coal beds, one about 9 ft. in thickness, the second about 2 ft. in thickness and the third about 10 ft. in thickness. While owing to the broken nature of the country it is impossible to see whether or not there are faults in the seams, the general indications are that there are none.

The region is essentially coal country; the predominating rock is limestone intermixed with layers of sandstone and slates. Millions of tons of coal are actually in sight. The government analyst in Hongkong reports on the analysis of a sample of this coal that it contains 0.8 per cent. of moisture, 17.6 per cent. of ash, 20.7 per cent. of volatile combustible matter and 60.9 per cent. of fixed carbon. The percentage of sulphur is placed at 1.2 per cent., and the calorific value is 12,830 B.t.u. The ash is grayish white in color. The coke made from this coal is of hard behavior and burns with a fairly long flame.

The matter of transportation has been one of the chief factors in opening such mines. The North River, where these coal seams are found, is too shallow for successful water transportation, and there is no economical means of transport at this time. It is anticipated, however, that the Canton-Hankow Ry. line will be completed to this district in about two years at the present rate of progress. The completion of this line will not only immediately open up this coal field, but it will also make other fields available for the Hongkong coal market and for export.

The immediate need of these fields is modern machinery and capital. The capital needed for the development of the property examined is about $150,000 gold.

Western Rate Advance on Coal

SYNOPSIS—The recent decision of the Commerce Commission in the Western rate case makes a sweeping readjustment in coal freights. The tonnage affected aggregates more than 13 million. A general advance was granted except to South Dakota. Complete text of that part of the decision covering coal rates is given.

It is proposed by tariffs under suspension to increase the rates on bituminous coal from mines in Indiana, Illinois, Kentucky, Alabama, Missouri, Arkansas, Oklahoma, Kansas, Colorado, New Mexico and Iowa, and from the docks on Lakes Michigan and Superior when shipped to points in Western trunk line and Southwestern tariff committee territories. Some reductions are proposed and the increases are either 5 to 10c. per ton. The increased revenue is 5.36 per cent. of the present revenue on bituminous coal.

Scope of the Decision

By taking the reports for one week in May and one week in October, 1914, of the roads hauling 86.5 per cent. of the coal traffic involved, and multiplying the amounts so shown by 26 to obtain estimates for a full year, and by applying the same basis to the roads not reporting, the respondents give fairly accurate figures which show present rates, weighted haul, revenue per net and gross ton-mile, and average load. These show:

	12 Roads in Southwestern and Trans-Missouri Territory	15 Roads in Western Trunk Line Territory
Total mileage operated	34,607	49,780
Tons originated (estimated for the year)	4,628,702	8,951,956
Average weighted haul (miles)	256	327
Average rate per ton	$1.45	$1.50
Average revenue per net ton-mile (mills)	5.66	4.59
Proposed increase for 27 roads is (mills)	.26	.....
Average revenue per gross ton-mile (mills)	3.97	3.20
Proposed increase for 27 roads is (mills)	.18	.....
Proposed average rate per ton	$1.526	$1.581
Proposed increase per ton	0.076	0.081
Average net load per car for 27 roads (tons)	41.63	.....

Combining the two groups the percentage of increase is 5.36, the average weighted haul 303 miles, the average present rate per ton $1.483, and combining 90 per cent. empty haul, the revenue per gross ton-mile is 2.84 mills.

REPRESENTATIVE BITUMINOUS COAL RATES ON WHICH INCREASES ARE PROPOSED.

From	To	Distance, Miles	Present Rate per Ton	Proposed Rate Per Ton	Proposed Rate Per Net Ton-Mile, Cents
Peoria, Ill.	Des Moines	250	$1.70	$1.80	0.720
Peoria, Ill.	St. Paul, Minn.	462	1.50	1.60	.346

* Distance from Birmingham, Ala., as given in W. W. Miller Exhibit 4.

Rates have been so adjusted by the carriers that mine operators in the general territory may sell their output in common markets. To do this, rates from the mines located at the greater distances must be accorded rates which yield less per ton-mile than the rates from the nearer mines. In other cases the necessity of maintaining rates at intermediate points no higher than rates to the terminal point makes rates to intermediate points lower than rates to points for similar distances where the rule of the fourth section does not apply. The preceding table shows representative rates, present and proposed, and the revenue per net ton-mile which the proposed rates would yield.

It is estimated by a witness for the respondents that the ratio of empty to loaded mileage is 90. On the St. Louis & San Francisco road from May 1 to Dec. 1 in 1914 this ratio was by actual test 94.79; on the Chicago & Alton the ratio for one year was 82.2; while the average is given as 89.

Some Peculiarities of Coal Traffic

That trainloads are not hauled in the southwest appears from a table showing the average daily production for December, 1914, of mines on the St. Louis & San Francisco R.R., which may be accepted as representative of the section, as follows:

District	Output (cars) Company	Output (cars) Commercial	Output (cars) Total	Total Working Days	No. of Mines	Average No. of Cars per Mine per Day
Alabama	710	3069	3,779	25	31	4.88
Arkansas	330	522	852	25	16	2.13
Southeastern Kansas	1099	3940	5,039	25	95	2.12
Missouri	66	244	310	25	5	2.48
Oklahoma	559	531	1,090	25	16	2.73
Total	2764	8306	11,070	25	163	2.72

While no such definite information is given as to the Western roads, comparing the mileage operated with the tons originated, as shown in the table first above, it is deducible that there can, on the average, be little trainload movement in this territory.

Coal mines are usually located off the main line of the carriers, thus necessitating a switching movement to and from the mines of an average of over a mile; cars when placed on tracks leading to the mines earn no demurrage; the average tare weight of the car is about 18.5 tons; and the average weight of the load is about 41 tons.

Bituminous coal is not stored at the mines, but is loaded as mined; and because of this and the resulting facts that cars are sometimes ordered and not used, and sometimes loaded and not immediately billed out, and that diversion in transit is necessary in order that coal may be delivered when and as needed, cars in this traffic are kept in use for a longer time, compared with the distance hauled, than is true of the average of other traffic. The cost incident to the assembling and diversion of coal is material, but the exact measure thereof cannot be determined from this record. As pointed out in the general discussion of the carriers' financial situation, there has been a constantly increasing cost of maintenance of these heavy coal cars, a cost augmented by reason of the injury caused by these heavy cars to other lighter equipment.

Between the month of lowest and the month of highest density of this traffic there is a difference of 89.73 per cent.—greater than the difference between the maximum and minimum tonnage of any other particular kind of traffic. This variation indicates that the movement is seasonal; and the fact that miners' contracts are renewed biennially, causing uncertainty in the production, makes for heavy fluctuations in the volume of traffic; and "although a full car supply cannot be expected all the time, carriers must do more than to provide themselves with sufficient equipment for the slack period of coal production." (Vulcan Coal & Mining Co. vs. I. C. R.R. Co., 33 I. C. C., 52, 71 and cases cited.)

The Classification of Coal

That coal loads heavily and that the loss and damage is but nominal offset to some extent the special costs incident to this traffic; coal is of low value, and the value of the particular commodity has always been regarded as a material fact to be considered in determining the rate. On this subject, in Investigation and Suspension Docket 26 to 26C, Rates on Coal, 22 I. C. C., 604, 623, 624, we said:

> If a carrier may raise all rates to a basis where each will bear its share of cost, including all costs, and no lower rate is reasonable, then it must follow that all rates are unreasonable which yield to the carrier a greater return than such cost. Under such theory what would be the rate on tea or silks, or high-priced horses, or delicate machines? Is there to be no classification of freight excepting upon the basis of cost of transportation plus insurance risk? If so, the tariffs of every railroad in the United States must suffer a revolutionary change. In all classification consideration must be given to what may be termed public policy, the advantage to the community of having some kinds of freight carried at a less rate than other kinds. And this is the true meaning of the phrase "what the traffic will bear." It expresses the consideration that must be shown by the traffic manager to the need of the people for certain commodities. He accordingly imposes a higher rate upon what may be termed luxuries as compared with that imposed upon those articles for which there is a more universal demand. He also gives consideration to the fact that the rate so imposed enters into the ultimate price to the consumer to but a small degree when the article is one of high value, and that those in the community who can afford to purchase such articles can well afford to pay a rate greater than that which could reasonably be imposed upon the general public for commodities of common use. In this sense what the traffic will bear and the value of the service are analogous. . . . We may not say that a rate shall be fixed so as to meet the requirements or needs of any body of shippers in their efforts to reach a given market, nor may we establish rates upon any articles so low that they will not return out-of-pocket cost. Neither could we fix an entire schedule of rates which would yield an inadequate return upon the fair value of the property used in the service given. There is, however, a zone within which we may properly exercise "the flexible limit of judgment which belongs to the power to fix rates." These are the words of the Chief Justice of the Supreme Court, 206 U. S., 26. There is no flexible limit of judgment if all rates must be upon a level of cost, and out of every dollar paid to the carrier must come a fixed amount of return for capital invested.

To the same effect see Union Tanning Co. vs. S. Ry. Co., 26 I. C. C., 159.

Coal mined in the states here affected has increased in value but little since 1904. The price, except in the states of Alabama and Kentucky, is given for the years 1908 to 1913 in the subjoined table:

AVERAGE SELLING PRICE, ALL COAL FROM MINES IN STATES SHOWN, 1904 TO 1913, INCLUSIVE

(Taken from bulletins, "Production of Coal," by Edward W. Parker, United States Geological Survey)

State	1908	1909	1910	1911	1912	1913
Illinois	$1.05	$1.05	$1.14	$1.11	$1.17	$1.14
Indiana	1.06	1.02	1.13	1.08	1.14	1.11
Missouri	1.64	1.65	1.79	1.72	1.76	1.73
Iowa	1.63	1.65	1.75	1.73	1.80	1.79
Kansas	1.49	1.44	1.61	1.53	1.62	1.67
Oklahoma	2.03	2.00	2.22	2.05	2.14	2.05
Arkansas	1.68	1.48	1.56	1.61	1.71	1.76
Colorado	1.41	1.33	1.42	1.45	1.49	1.52
New Mexico	1.37	1.29	1.39	1.44	1.42	1.46

A shipper gave the prices paid by five railroads for their fuel coal 1910 to 1914 as somewhat higher than the prices shown in the foregoing table; and it appears that one of the carriers is paying the same for coal as in 1910, two slightly more, and two slightly less.

The relative density of all traffic hauled by representative eastern and western roads appears from the following table:

FOR YEAR ENDED JUNE 30, 1914.

Eastern bituminous coal originating roads:	Average Miles Operated	Freight Revenue per Mile of Road	Tons of Freight Carried 1 Mile per Mile of Road
Pennsylvania Co.	1749	$25,518	4,448,369

* Passenger mileage operated, 1585 miles. † Passenger mileage operated, 207 miles.

That the production of coal in the territory involved has regularly and considerably increased since 1900 is sufficiently illustrated by the subjoined table giving the production for 1900 and 1913:

PRODUCTION OF BITUMINOUS COAL IN STATES COVERED BY WESTERN ADVANCE CASE

(From Coal Statistics, by Edward W. Parker, Coal Statistician, Department of the Interior, United States Geological Survey)

	1900	1913
Arkansas	1,447,945	2,234,107
Oklahoma	1,922,298	4,165,770
Kansas	4,467,870	7,202,210
Missouri	3,540,103	4,318,125
Iowa	5,202,939	7,525,936
Indiana	6,484,086	17,165,671
Illinois	25,767,981	61,818,744

The present rates in the Southwest including rates from New Mexico and Colorado to Texas are generally lower than in 1906 and 1908. Rates on slack coal less than those on lump coal were established in this general territory about 1905, and this has resulted in a material increase in the value of slack coal. To the Missouri River rates have fluctuated since 1904, though except for the fact of the establishment of rates on slack coal they are now somewhat higher than then. The proposed rates from the mines to South Omaha show large increases over former rates. When applied to the weighted average on the shipments of one large shipper they yield only 4.34 mills per net ton-mile.

The rate to the "Twin Cities," which is the designation given St. Paul and Minneapolis, from the southern Illinois group of mines is a base rate, and rates to Wisconsin, Iowa, Minnesota and South Dakota are somewhat influenced thereby. This rate to the twin cities has been competitive with the rates from Duluth and has undergone many changes. In 1887 the rate was $2 per ton; in 1889, $1.75; in 1892, $2; in 1896, a rate of $1.62½ was established, but one road having made the rate $1.50, that became the rate for all roads. In 1899 an increase was made to $1.65; in 1902 there was a reduction to $1.40; in 1903 an increase to $1.50, and in 1904 a decrease to $1.40. The $1.40 rate remained effective until, in obedience to an order of this commission requiring a rate to the twin cities no higher than to intermediate points, the carriers increased the terminal rate of $1.50. This increase was sustained by us in Daly Coal Co. vs. C. & A. R.R. Co., 33 I. C. C., 467. In the present case it is proposed to increase this rate to $1.60. We are of the opinion that the territory affected should properly be considered as one. So considered, while there have been fluctuations, the present rates are no higher than they were 10 years ago.

Rates to the Southwest

It has been shown that for the weighted average for a haul in the Southwest of 256 miles, the present rate is $1.45 a net ton, and yields a revenue per net-ton-mile of 5.66 mills. In the Western trunk line territory the average haul is 327 miles, the rate $1.50 per ton, and the revenue per net ton-mile 4.59 mills. In Okla. & Ark. Coal Traffic Bureau vs. C. R. I. & P. Ry. Co., 15 I. C. C., 216, 223, decided June 24, 1908, we gave a table of state commission rates showing for a haul in Texas and Oklahoma of 250 miles a rate of $1.65 and a revenue of 6.6 mills; for Illinois and Iowa for 300 miles, rates of $1.20 and $1.50, and revenues of 4.2 and 5 mills, respectively. Speaking of Southwestern coal rates, we there said:

> As affecting the traffic here involved we regard these rates as somewhat too low, especially for the shorter hauls, in view of the grouping policy adopted by the carriers by which many of the mines in a single group, although at some distance apart, are brought into competition upon a parity as to railroad charges in supplying the fuel needs at a single point of destination.

In that case we prescribed rates to specific points higher than the average of rates here proposed. Against an average haul of 256 miles and a rate of $1.526 a ton on all coal here proposed, we prescribed in this same territory a rate for 228 miles of $2.25 per ton on lump coal and $1.65 on slack coal. Weatherford Chamber of Commerce vs. M., K. & T. Ry. Co., 31 I. C. C., 665.

Our attention has been particularly called to the proposed rates on lump coal and coke of $2.85 and on slack coal of $2.35 per net ton for 256 miles from Trinidad, Colo., to Amarillo, Tex. This rate is high as compared with the average rates proposed, but the movement is in a territory of sparse traffic. In Amarillo Gas Co. vs. A., T. & S. F. Ry. Co., 13 I. C. C., 240, we prescribed a rate for this haul on coke of $2.90 per ton, the rate on coal then effective.

For hauls ranging from 58 to 563 miles in a territory where traffic is light we found that rates which applied to the actual movement yielded from different mines a revenue per net ton-mile of 10.06, 8.74, and 8.18 mills, respectively, were not shown to be unreasonable. Public Utilities Commission of Idaho vs. O. S. L. R.R. Co., 33 I. C. C., 103. In 1909 we held that a rate from Chicago to Fort Dodge, Iowa, for 375 miles that yielded slightly less than 5 mills per net ton-mile was "certainly not a high rate." Fort Dodge Commercial Club vs. I. C. R.R. Co., 16 I. C. C., 572, 582.

The comparisons here used may not be altogether persuasive, but they are probative, and tend to establish that the increased rates here proposed are just and reasonable. The maximum increase suggested is 10c. per ton, while the average increase is less than 8c. per ton.

High Rates to Dakota Points

Rates to South Dakota yield revenues per ton-mile somewhat higher than those yielded by the average of the rates involved. Specific rates referred to by a witness for protestants show ton-mile earnings ranging from about 3½ to 6 mills. The actual weighted average from the statistics of the Burlington is as follows:

Point of Origin	Distance, Miles	Revenue per Net Ton, Cts.
Illinois	512	4.76
Manitowoc, Wis.	689	4.01
Milwaukee, Wis.	592	4.48

Where deliveries were made on connecting lines the revenue was less than stated in the table above. The coal for South Dakota usually moves in box cars and consequently shows a less empty mileage and a lighter load, the load averaging 28.5 tons.

Rates on coke in Southwestern territory are published in coal tariffs, and coke takes the same rates as coal. It is only in this territory where coke and coal rates are increased generally that coke rates are involved in this proceeding. Coke loads lighter than coal, and there is no transportation reason why rates thereon should be lower than on coal. Slack is fine coal used principally in furnaces, and to some points rates have been accorded on slack lower than on lump coal. Facts showing a justification of increases in the lump coal rates equally justify a corresponding increase in the rates on slack.

Pittsburgh vs. Illinois Coal in the Northwest

From lake ports in Wisconsin and Minnesota to intrastate points in those states no increase is proposed in the rates on dock coal. The like situation exists in intrastate rates from mines in Iowa, Missouri, Kansas, Arkansas, and Oklahoma. It is claimed that injury will result to the coal miners of Illinois unless increases in coal rates are made from the dock commensurate with the proposed increases from the mines in that state. Illinois coal is said to be somewhat less attractive to users than is coal from the Pittsburgh district, but the Illinois coal can be sold more cheaply than the Pittsburgh coal. Details of the cost of each at the representative consuming markets of St. Paul and Minneapolis were shown by protestants in a table here inserted.

The following is a comparison of prices for coal delivered at St. Paul and Minneapolis, the largest coal markets west of Chicago:

FROM PITTSBURG, PENN., DISTRICT

Coal at mines	$1.25
Average freight charges to Lake Erie ports	.75
Loading to vessel	.05
Lake freight Erie to Superior	.32
Dock charges at Superior and Duluth	.40
Freight from Superior and Duluth to twin cities	.96
Total	$3.73

ILLINOIS COAL

Average selling price at mines (10 years)	$1.10
Present average freight charges from state of Illinois	1.93
Total	$3.03
Margin to cover difference in quality	$0.70

From other facts of record it appears that past increases in rates from Illinois without corresponding increases in the rates from the docks have resulted in relatively lessening the amount shipped from the Illinois mines. Since the rates from the docks at Milwaukee to points in Wisconsin and rates from Duluth to the twin cities remain unchanged, some carriers maintain existing related interstate rates.

INCREASED RATES TO SOUTH DAKOTA NOT ALLOWED

To South Dakota destinations an increase of 10c. per ton is proposed in the rates on bituminous coal from Lake Michigan and Lake Superior ports, as well as from Illinois mines. No increase is proposed from any of the lake ports to Minnesota destinations. The present rates from the lake ports to South Dakota destinations are on a higher per ton-mile basis than rates to intermediate destinations in western Minnesota. An increase in the rates to South Dakota destinations unaccompanied by a like increase in the rates to Minnesota destinations would accentuate the existing violation of the general principle that the ton-mile revenue should decrease with increased distance. The present rates to South Dakota destinations appear to be on a higher basis than to other Western destinations, although the greater part of the haul is through the lower-rated territory. For these reasons the increases proposed to South Dakota destinations have not been justified.

From the facts of record we are of opinion and find that, with the exception of rates on coal to points in South Dakota, the proposed increased rates on coal have been justified, and the orders of suspension relating thereto will be vacated.

Des Moines, Ia.—Iowa coal operators feel that the increased rates on bituminous coal, granted the railroads by the Interstate Commerce Commission, will be of benefit to them inasmuch as short hauls will give them an advantage over outside companies. Considerable business in northern Iowa especially has gone to outside companies. More than 22 per cent. of the total railway tonnage in Iowa is bituminous coal.

"Extracts from a Superintendent's Diary"

It is hard to realize the almost universal appeal that music possesses unless some unusual event draws our attention to it.

We have experienced such an unusual event in our camp during the past week, and in future I intend to make good use of the experience gained.

One of my wife's cousins, a young lady with a magnificent singing voice, spent the week with us; and because she delights to sing whenever she feels that her singing is appreciated, we had opportunity to hear almost her entire repertoire.

Twice during the week, at night, almost the entire population of the camp gathered around our house, attracted by her singing, and on the last night of her visit she went out on the veranda of the house and sang a number of songs for the sole pleasure of those who were on the outside. It was there that I was reminded of the all-prevailing power and charm of music.

From my position on the veranda, back in the shadows, I could see plainly all that was going on and no one could see me. The possibilities of such an opportunity to watch unobserved the emotions of men is quite uncanny, and my experience was entirely in keeping with the possibilities.

The song that made the deepest impression was, "Home, Sweet Home." Mining-town homes are not average homes, at least not in our country. They are at best only temporary homes, and there can be few ties binding their occupants to them. Children and grandchildren do not return to them because of any sentiment that is supposed to attach to the place of one's birth. It would even be difficult to find a mining-town home that had been occupied for a long-enough period continuously by any one family to be called the birthplace of all of the children of that family.

One may be pardoned for wondering then why "Home. Sweet Home" should make such an impression on our men.

But there was no mistaking the appeal. During the singing of the song, the interest was so intense that a deaf stranger passing, seeing their faces, without being conscious of the music, might easily have been led to believe that the entire crowd was under some strange hypnotic spell. And in reality he would not have been so very far from the truth.

After the song had died away, almost every one in the audience, as if by common impulse, came up to tell the singer how much the singing had been enjoyed, and in the manner of the telling was evidence of the deep emotion that had been aroused.

While they were still under the spell, someone in the audience suggested that Tim McDougal give a song and allow the lady to rest. Tim responded instantly, and his song was well received, much to the surprise of everyone present, because Tim was not much of an artist at best, and singers are supposed to suffer by comparison.

But Tim's success was not the only surprise of the evening. Old grudges seemed to be forgotten, neighborhood quarrels seemed to have lost their meaning, and distinctions of birth and salary meant nothing at all to the crowd while under the spell of music.

Everyone seemed to be so thoroughly happy that there was no place for any unpleasant thoughts, and when the music came to an end everyone in the audience went off smiling.

I am going to arrange matters in the future so that the musicial talent in our village will have an opportunity to express itself and demonstrate its value to our community.

Watch Wires Used in Blasting

The increasing use of electric blasting and of larger charges emphasizes the importance of watching the condition of all leading and connecting wires and blasting machines to see that they are kept in good condition and that connections are well made.

Avoid kinking wires, as this leads to cracks and breaks not easily detected through the insulation. Don't drag wires over the ground, as this scrapes off the covering. Test the blasting machine with the rheostat at regular intervals to see that it is working up to capacity. Test all circuits with the galvanometer before attempting to blast and thus make sure that the insulation is perfect.

Coal Industry of Natal

One of the leading industries of Natal is that of coal mining, says *Commerce Reports,* and as in all other enterprises this showed a slight decrease in the output for 1914 over the preceding year. The decrease was not due altogether to the war, although that was the greater reason. Labor trouble in the early part of the year 1914 caused an almost entire cessation of railway traffic for about a month and interfered with the running of the mines.

There are 21 coal-mining companies in this district, with a total output last year of 2,316,665 tons, a decrease from the year 1913 of 281,743 tons, as the output for that year was 2,608,408 tons. This output for 1913 was the largest ever experienced, while the yield of 1914 shows a drop from the preceding two years. The output of the local mines in 1910 was 2,296,687 tons; for 1911 it was 2,394,338 tons, and for 1912 it was 2,472,085 tons.

A considerable quantity of this coal is used in the district, but the greater portion is sold for export and for bunker coal, the latter being the largest industry. The bunker coal taken on vessels for fuel last year amounted to 948,000 tons, a falling off of 66,000 tons from the year before, which amounted to 1,014,000 tons, a comparatively small decrease. But in coal exported the falling off was much greater, 42 per cent., as the coal exported last year was only 355,000 tons, while for the year 1913 it was 615,000 tons.

⁂

Coal Deposits in Sweden

Dr. Edward Erdmann, state geologist of Sweden, has made investigations regarding the coal area in the province of Scania, says Consul Emil Sauer in *Commerce Reports,* and according to his report the coal deposits there are calculated to amount to 106,500,000 tons.

The rate of mining the last few years has been only about 300,000 tons per annum. The annual consumption of coal in Sweden amounts to over 4,000,000 tons, and the domestic production supplies only about 7 per cent. of this, while the balance, or 93 per cent., must be imported from abroad.

⁂

Keeping Conveyor Belt Records

A new method of recording the cost of various conveyor belts in operation has been worked out by the B. F. Goodrich Co., of Akron, Ohio, in the interest of all belt users.

Ordinarily, accurate costs are rather difficult to determine, and many people have not the time to work out an adequate system for making computations. The use of various belts, however, is an important factor, and many a dollar can be saved when it is known where to cut down the tonnage cost.

The card record in question, which is mailed free on application by the Goodrich company, is simple, but most efficient. It will help to stop the small leaks where profit continually slips out.

Forty-six years of experience naturally gives this concern a wealth of material from which to formulate ideas. The development of these ideas, however, is not a secret, and their arrangement on the record card is purely a service to the belt user which cannot help but be beneficial.

Specifications for the Egyptian Railway Contract

The specifications for the Egyptian State Railways and Telegraphs contract are an interesting example of foreign practice. The contract involves 360,000 metrical tons (354,310 gross tons) of either Welsh or American screened steam coal. Bidders must use form attached to the official "specification." It is provided that Welsh coal must be furnished from certain specified collieries only, and American coal must be suitable for locomotives, to contain about 35 per cent. and not over 40 per cent. volatile and about 6 per cent ash, both on the dry basis. Analysis must be submitted with the proposal, the collieries and seams named and certificates furnished. Each cargo is to be judged by a sample taken at the loading port by the administration's inspector. For more than 2 per cent. ash in excess of the percentage established in the contract 4c. will be deducted for each 1 per cent. or fraction thereof. Prices are to be quoted in British currency per metrical ton (equivalent to 2204.6 lb. avoirdupois). Bidders may quote by telegrams, provided the tender has been sent by mail, the space for prices being left blank. Two per cent. of the total value must be deposited as "earnest money," this to be increased to 10 per cent. if the tender is accepted.

On Welsh coal, prices are to be f.o.b. administration steamer at loading port, and on American coal delivered free at railway quay, Gabbary, Alexandria, custom dues only are excluded. The steamer is to pay 6c. per gross ton for stevedoring at Alexandria, besides providing steam, etc., in accordance with Welsh Coal Charter Party.

Deliveries are to be made from Sept. 1, 1915, to Apr. 30, 1916 in the case of Welsh coal f.o.b., and from Oct. 1, 1915 to May 31, 1916, delivered in the case of American coal, about in monthly proportions, but the administration has the option of increasing any monthly quota up to 30 per cent. or dividing the contract according to a prescribed table, the unit of shipment being 5000 tons, or one shipload. There is also a rigid strike clause and a provision that the buyer may purchase for the account of the contractor in case of delays.

On American coal none is to be shipped except in holds with at least 12x12-ft. hatchways and not between decks. Steamers must not be over 415 ft. long and loaded draft not over 25 ft. on arrival at Alexandria. Guaranteed rate of discharge is to be 700 tons per working day. Contractors are to make all necessary arrangements for payment of freight. Settlements are to be made by check on London in full on discharge.

⁂

Coal Storage at Sewall's Point

The accompanying photographs show the huge coal yards at Sewall Point, near Norfolk, Va., where a mountain of coal estimated to contain nearly a million dollars' worth of fuel is piled for shipment. This stored coal sometimes becomes overheated and catches fire from spontaneous combustion, so that great care must be exercised to prevent these losses by fire. A body of guards are constantly on duty ready to check in the incipient stage any flames that may start. The coal piles shown are maintained by the Virginian R.R.

STORED COAL AT SEWALL POINT, VA. GREAT CARE IS NECESSARY TO PREVENT FIRES

SOME OF THE MEN EMPLOYED TO FIGHT FIRES AT THE SEWALL POINT YARDS

The Labor Situation

SYNOPSIS—The miners in eastern Ohio believe that when the mines are idle the officials should receive strike benefits, but no wages. Ohio miners contend that they are victims solely of the high railroad rates, but the operators claim that both wages and freight rates are to be blamed. In Colorado J. R. Lawson obtains a supersedeas. In Illinois a union water supply is barred from a nonunion washer, and violence is attempted against a coöperative mine.

On Aug. 11 the miners of subdistrict No. 5 of the United Mine Workers of America in Ohio met in convention. This subdistrict, it will be remembered, covers eastern Ohio. The report of Secretary-Treasurer William Applegarth was read to the convention. It showed that four local unions had been abandoned, three had been organized and seven exonerated from paying tax. On Feb. 28, 1915, the date up to which the report extends, only $500.60 was in the treasury.

C. J. Albasin, the president, had received during the year $843 as salary. His expenses had been $687.38. The salary of Vice-President William Roy had been $1074.75 and his expenses $685.31. William Applegarth received $1128.20 as salary and $257.42 for expenses. These payments seem quite reasonable awards to the men who have put up the long though losing fight for the miners in eastern Ohio, but of course compared with what the miners have been receiving meanwhile it is a plethora of wealth, and the statement of the moneys they received aroused much feeling.

Union Leaders to Receive Only Strike Benefits

The miners passed a resolution prescribing that the salaries of the officers shall cease when the whole of the subdistrict is on strike and that they shall then receive their expenses and strike benefits in the same manner and in the same amounts as the miners thus suffering from idleness. The miners can by no means discover a more certain way of assuring themselves of defeat. As soon as a strike occurs the leaders will be prone to seek a settlement, for it would cost them nothing if the miners failed to win. All kinds of discontent will arise between the leaders and the men. Among other matters it was noted in the report that the union paid out $38,000 for shoes.

Extremely creditable was the disinclination of the union to let Homer Wilson take office. He had been serving as a bartender, and the constitution forbids any member to handle intoxicants. Wilson probably needed the money to support his family, and so was less subject to censure, and eventually was allowed to take a seat in the convention. The U. M. W. of A. does well to take a strong stand on the temperance question.

No Benefits for Idlers and a 5 per Cent. Tax

Some of the members who were working had been receiving benefits and some of the beneficiaries have failed to take work when it is offered. It was decided that such men should be suspended until they paid back all benefits thus improperly paid. The working members of the union in eastern Ohio will be required to pay 5 per cent. of their earnings toward the support of those out of work. There are 4000 of these idle men. Resolutions were passed against coöperative mining. Men so engaged were classed as mine operators. They are to be fined $100 and suspended for six months.

The miners at the Blaine mine of the Lorain Coal & Dock Co., one of the largest mines in eastern Ohio, located near Bridgeport, have gone on strike for the third time in two weeks. The men resent the fact that scales have not been installed to weigh run-of-mine coal as agreed, and they can hardly be blamed for their frequent and determined protests. They are clearly entitled to the scales and the run-of-mine method of weighing.

Only the Sunday Creek Co. Has Entirely Closed Down

In the Hocking Valley field conditions are not nearly so bad as have been represented. It is true that the Sunday Creek Co. has closed down its mines completely, and it is by far the leading company in that region. But according to a report submitted to the freight department of the Hocking Valley Ry. on Aug. 11, 40 of the 68 mines served by the road were then in operation. These were running either steadily or part time, and together averaged a total of 200 cars of coal a day. That is only five cars per mine—at most 250 tons, and probably much less. However, as the mines are small the tonnage shows considerable activity.

The brunt of the case against the Hocking Valley Ry. is being borne by the Sunday Creek Co., and it is felt that the idleness is only in part due to a lack of orders for coal. The Sunday Creek Co. is suspected by some persons of trying to fortify its argument by closing its mines. The New Pittsburgh Coal Co. has three of its five mines working; the Manhattan Coal Co. five out of eight; while the York Clay & Mining Co. has two mines and is working only one.

The North Hocking Coal Co. and the Standard Hocking Coal Co. have two mines each and all are working. The Hocking Block Coal Co. has three mines, all in operation. Out of 37 mines individually owned or coöperatively mined, 24 are running and 13 are closed. The Sunday Creek Co., with nine mines, is the only concern of any importance not operating at all.

Col. E. S. Bryant has promised to look into these figures. He could see no reason why a single company should be the only one unable to operate even part time. Especially does the idleness appear unnecessary when it is recalled that most of the mines in the Pomeroy district and in eastern Ohio are also operating.

Some of the Men Show Little Inclination to Work

In face of the continued refusal of the general public to get excited about the miners' situation, the adjutant-general's department is considering another method for relieving conditions. They have come to the conclusion that the man who refuses work to support his family should be prosecuted and sent to the stone pile.

A case at Corning, Perry County, gave rise to this trend of thought. Work in a brickyard, where some shale had to be blasted out, was offered to a miner who was in the habit of handling explosives. After he had been at work for several hours a representative of the union came along and inquired what the job paid. He was told $2 a day. He refused to allow the man to continue at work for that pay.

It is the opinion of state officials that such a man, unless he has other means of keeping his family, can be prosecuted for nonsupport. He will be cut off from receiving state aid.

Interstate Commerce Commission Will Do Nothing

Several Ohio operators and their attorneys recently conferred with the Interstate Commerce Commission at Washington, D. C., and pressed for a complete readjustment of coal rates in the Middle West. A number of railroads engaged in carrying coal were represented at the conference and operators in other states were also present.

The commission was loath to open the question which might involve a readjustment of rates throughout the country. It refused to arrange for a further conference on the matter. J. H. Winder and E. C. Morton, general manager and attorney, respectively, for the Sunday Creek Co., and W. K. Field, president of the Pittsburgh Coal Co., which holds the stock of the New Pittsburgh Coal Co., were among those attending the conference.

But despite the attempts to induce the Interstate Commerce Commission to grant lowered freight rates, the Sunday Creek Co. is pressing for relief from the Ohio Utilities Commission and has obtained subpœnæ duces tecum for all the records of the Hocking Valley Ry. bearing on the cost of transporting coal and assembling coal trains. Accordingly, on Aug. 17, when the Utilities Commission reconvened, the Hocking Valley Ry. presented several drayloads of undigested records. They could have supplied the summaries as worked out in detail by the auditing department of the railway company, but failed to do so.

It would require a whole year for experts to wade through the testimony furnished. The Ohio Utilities Commission appointed the men originally employed by the Sunday Creek Co. and Beman Thomas, a local accountant, as examiners. The railroad objected to its own accountants being used, saying they were biased, but the commission persisted in its course and an injunction was threatened by the attorneys for the railway company to prevent the experts from examining the books. It was claimed that application for the injunction would be made in the Ohio Supreme Court, but up to Aug. 21 no such action had been taken.

The Sunday Creek Co. filed an amended intervening petition asking that the investigation be extended to both the Toledo & Ohio Central and the Zanesville & Western Ry. The petition in the case of these roads is the same as originally filed by the U. M. W. of A. officials against the Hocking Valley.

John H. Winder, general manager of the Sunday Creek Co., announced that eastern Ohio operators have promised to enter the case soon. Thus all the coal freight rates in Ohio will be subjected to inquiry. On the other hand, the railroad companies will probably identify themselves with the cause of the Hocking Valley, and a battle-royal is promised.

After the appointment of the special examiners to go over the records of the railroad company the hearing was adjourned until Oct. 5. At that time it is hoped that the data desired by the attorneys for the coal company and the miners will be secured. These data relate to the costs of assembling trains, of transportation proper and of maintaining switching and terminal facilties.

The operators are determined, however, that the question of freight rates shall not be allowed to hide the important difference in wage scales existing between Ohio and West Virginia, which they feel is crowding the Ohio market to the wall. It is not the difference in the cost at the market which alone pinches; the cost at the mine is also in controversy.

The Difference in Wage Scales in Neighbor States

Walter R. Woodford, of the Rail & River Coal Co., with mines at Bellaire, has given out a statement saying that the price at the mine of West Virginia mine-run coal is 70c. per ton or even less. Mine-run in Ohio costs the operators 95c. per ton under normal conditions. He gives the following comparative scale after increasing the day rates in the Ohio region one-eighth so as to put the 8-hr. day rates on an even basis with the 9-hr. day scale of West Virginia:

	No. 8 Seam, Ohio	Kanawha, West Virginia
Pick mining	$0.678	$0.49
Machine loading	.39	.26
Machine cutting	.08	.065
Water haulers	3.195	2.05
Motor and machine runners	3.195	2.55
Tracklayers	3.195	2.43
Trackhelpers	2.93	2.00
Trappers	1.39	.89
All other inside day labor	2.93	2.00

These figures and others like them are making much stir in West Virginia, and statements are made to show that gross freight rates are higher from the West Virginia field than from Ohio, and that the West Virginia coal wins on its superlative merits. Moreover, it is said Ohio is a farming state and doesn't need any mines to secure its prosperity. West Virginia without mines would be a wilderness, whereas Ohio would be little the worse.

The mines in Ohio are said to be poorly equipped compared with those in West Virginia and are sinking gradually to a decline. This is doubtless true; but the inefficiency is not the cause of the misfortunes of the field, but rather the effect of higher wage scales as well as thinner, poorer coal and unfair freight rates.

Mr. Woodford questions the right of the state to ship men from the Hocking Valley to Cleveland to work on the streets and in other places at $1.75 per day when they refuse or are not permitted to work for an operator in Ohio at less than $2.62 or $2.84 per day.

Colorado Supreme Court Fails to Support Judge Hillyer

The Colorado Supreme Court has granted a writ of prohibition preventing Judge Granby Hillyer, of the Third Judicial district, from hearing the case against three men charged with murder in the Colorado coal strike. At the same time a writ of supersedeas was granted upon the application of John R. Lawson, international board member of the United Mine Workers in America, who had been assigned by the union to work in Colorado. He had been tried before a jury and found guilty of murder, being sentenced to life imprisonment. Justice S. Harrison White wrote the writ of prohibition, Justices Hill, Teller, Scott and Bailey concurring. Chief Justice Gabbert and Justice Garrigues dissented, but presented no written opinion.

The effect of the writ may be to prevent Judge Hillyer from trying any further cases. Two of the men he is not permitted to try are John Burke and Charles Haines, accused of killing Maj. P. P. Lester, of the National Guard during the battle of Walsenburg on Apr. 29, 1914. The third case is that of K. Uyada, a former striker accused of murder.

Hillyer for a Short Time a Company Attorney

Judge Hillyer before being placed on the bench by Governor Carlson appeared and argued in four strike cases, acting on behalf of the operators. The court felt that this might bias him in his judgments and may have prejudiced him in the trial of Lawson, even though he may have been honest in his determination to give the accused a perfectly fair trial. But it must be added that the employment of Judge Hillyer as an attorney for the coal companies was extremely brief. At one time the U. M. W. of A., through Horace N. Hawkins, desired to retain him, but he had given his word to Judge Northcutt that he would not accept a retainer from anyone else, though no names were mentioned as to the parties for whom Northcutt was retaining Hillyer.

Editorial reference will be made next week to the injunction proceedings in West Virginia and the anthracite region of Pennsylvania. These were brought to secure the freedom of speech and action on the part of members of the union who find that they are at variance with their paid leaders and representatives. In Pennsylvania, Thomas Butler ventured to take a stand on the mine-foreman certificate law different from that labeled orthodox. An attempt was made to dispossess him, and this the court has temporarily frustrated.

A New District No. 30 Erected by Disgruntled Union Men

Three locals out of four at Boomer, W. Va., have left the old district organization and formed a new district, which they have named District No. 30. They demand of the Boomer Coal Co. that the check-off be paid to them, and they have obtained an injunction restraining the company from paying the money to the officials of the old district.

The old union District No. 17 having so fiercely opposed all injunctions is ill-disposed by such judicial means to prevent the Boomer Coal Co. from paying the $500 in question to the unrecognized District No. 30. It has been their cry that the injunction is an unmitigated evil, and it would be a humiliating confession to make use of this instrument. It is said the Boomer Coal Co. is disposed to pay the money over to District No. 30, but it is hard to see how such an action can be justified, as its contract was made with District No. 17.

Strikes in West Virginia, Kentucky and Illinois

At Hartford, Mason County, W. Va., in the Pomeroy Bend district, 40 miners went on strike at the mine of the Jackson Coal & Mining Co. A miner desired to be changed from entry to room work, and on his being refused, his fellow-workmen quit for two days. Of course, the strike was a violation of the miners' contract. To begin with, the miners had no grievance and, secondly, if they had, the question by their agreement must be settled without a strike and in the manner provided.

At Harlan, Ky., 115 miners of the Catrons Creek Coal Co. were recently on strike for three weeks. They have returned to work without having gained the recognition of the union which they desired or the reinstatement of two men, the discharge of whom occasioned the walkout.

The Mt. Olive & Stanton Coal Co. has had a controversy with the United Mine Workers of America relative to the operation of the new $50,000 washer of the company. Nonunion men were employed on the work at the washer, but the water needed for its operation has been pumped from a nearby mine where union miners and a union engineer are employed. These men demanded that union men be engaged to operate the washer. If the plant was to be operated as a nonunion proposition, the men demanded that the union engineer should not be required to pump water for the jigs. By installing a pump at the washer the difficulty was successfully overcome.

The "Loss-Sharing" System in Coal Mining

In the issue of "Coal Age" of July 10, pp. 52 and 53, mention was made of the strong feeling of opposition among Illinois union men to the coöperative movement which may be better called the "loss-sharing" rather than the "profit-sharing" system. On Aug. 17, 12 men were charged with complicity in a plot to destroy the mine and buildings of the Granger Coal Co. at Winkle, Perry County, Ill. This mine is worked on a coöperative basis.

The preliminary hearing took place before Justice Fallon at Duquoin of that county. Two were held for the grand jury and the other ten were discharged. The two men held are David Richards, white, and William Hawkins, colored. They will be tried at the November term of the Perry County Circuit Court. Hawkins gave the authorities the information which resulted in the arrests. He said he was offered $200 to aid in blowing up the mine. Richards had dynamite caps in his pockets when arrested.

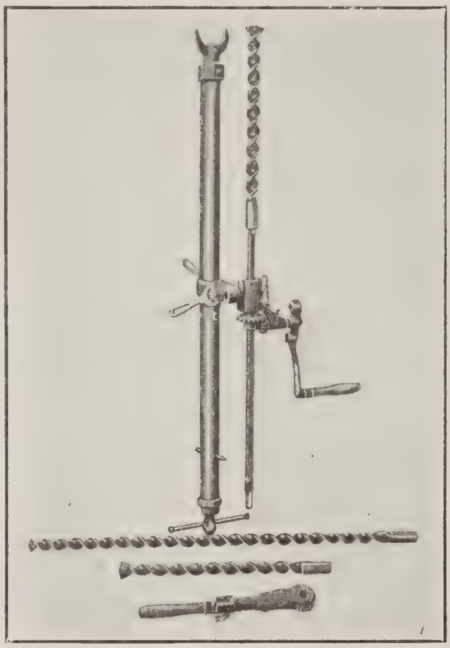
⁂

In the South Wales District and in Monmouth County, the county which adjoins South Wales but is in England, 60,345,295 short tons were produced in 1914. The whole tonnage of Great Britain was 297,520,193 short tons. So the South Wales field produced, roughly, 20.28 per cent. of the whole production of the United Kingdom. In 1913, 233,091 men worked at the mines of that district, of whom 35,003 were surface workers. Of course these figures have been seriously depleted recently by the recruiting sergeant's activites.

New Apparatus and Equipment

New Hand-Operated Post Drill

The Howells Mining Drill Co., of Plymouth, Penn., has recently placed upon the market a new post drill known as the "Spry Type C" machine. This drill is hand-operated and is designed for drilling coal and the medium hard rocks usually found in coal, fire clay and other mines.



THE POST DRILL SET UP TO DRILL VERTICALLY

The machine proper is mounted on a post light but sufficiently strong for the purpose. This post may be extended two-thirds of its normal length. Thus a 6-ft. post can be extended to 10 ft. in length. The boring head is carried on a yoke which encircles the post and may be readily clamped to it or moved from one position to another. The boring head also swivels on the yoke so that the auger or bit may be turned at any angle.

It may be thus seen that since the yoke may be turned completely around the post and the head swivels on the yoke throughout an entire revolution, the auger may be placed at any angle in either a horizontal or vertical plane or both and may be thus pointed in any direction whatsoever.

The vertical adjustment of the yoke on the post permits of holes being drilled within 5 in. of either roof or floor of a mine. The post will work with equal facility either end up. Augers are usually furnished varying in length by 2 ft., the ordinary set consisting of lengths of 2, 4 and 6 ft.

The ratio of the bevel gears transmitting motion to the drill is 1 to 2. Thus the auger makes one revolution to each two revolutions of the crank. The feed screw or bar which advances the drill may be furnished with 8, 10, 12 or 14 threads per inch so that if the operator turns the crank at the rate of 60 r.p.m. the advance of the auger would be $2^1/_7$ in. with a 14-thread bar or 3¾ in. with an 8-thread bar. For the 10- and 12-thread bars the advance would of course be 3 in. and 2½ in. respectively.

The illustration shows the drill equipped with a three-hole crank handle. An extension crank giving a variable sweep or a single- or double-acting ratchet handle may be employed. The sleeve within which the feed screw revolves is made in two pieces and may consequently be readily removed and replaced by a new one when the threads become badly worn.

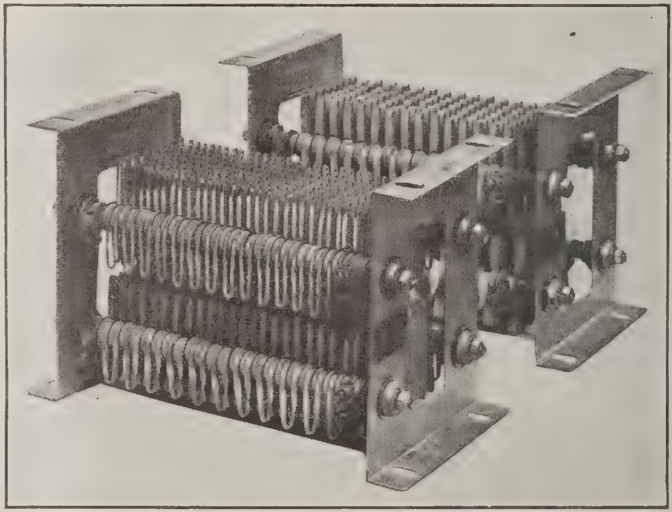
This entire machine, including post, yoke, crank, set of three drills, etc., weighs only about 65 lb. It may therefore be readily transported by one man. Although it was designed primarily for drilling coal preparatory to shooting down it may also be used to advantage in many mines for taking down top or lifting bottom. It is particularly advantageous where the top rock will permit of its use in drilling peg holes for suspending trolley wire. It may be set up in about one minute and with a 10-thread feed bar would put in a 6-in. hole in 2 min. if the crank were turned at 60 r.p.m.

This drill is now in successful operation in coal mines, both anthracite and bituminous, as well as in talc, gypsum and fireclay operations.

⁂

New Type of Grid Resistance

A new type of grid resistance for use in connection with direct-current motors is being placed upon the American market by the Ellcon Co., of 50 Church St., New York City. This is known as the E. M. B. unbreakable, jointless and rustproof grid resistance.



RESISTANCE FOR TWO 23-HP. 250-VOLT MINE LOCOMOTIVE MOTORS

Instead of building up a bank of grids, made of cast iron, and depending upon a tight surface contact at the bolt, to form the electrical connection between units, as is the ordinary practice with resistances of this type, the E. M. B. grid is made up of a continuous sherardized drawn steel wire. It is therefore not only extremely tough and may be subjected to severe abuse with impunity, but is rust-resisting as well.

The grids are composed of various sizes of steel wire to suit the current carrying capacity desired. At the point where the units of the ordinary cast grid come in contact, an extra loop of wire is employed. The tap or contact to the controller may consequently be easily and readily shifted or adjusted to secure proper acceleration.

The drawn wire of which the grid is composed entirely eliminates the possibility of weak or defective material entering into the construction of the grid. Heavy overloads do not seriously affect this resistance. The grids have been repeatedly subjected to a current which brought them to a white heat without warping or buckling the convolutions, which remained in as good shape as before except for the sherardizing.

The space occupied by these grids is about the same as that for the ordinary cast-iron resistance, they being assembled into sections or boxes of approximately the same dimensions, so that a change may be made from one type of resistance to the other without serious inconvenience.

This type of grid resistance is peculiarly adapted to heavy overloads or where the load is intermittent and severe, such as in steel mills, mine hoisting, traction work or mine haulage. Several mining locomotives used by various coal companies are now employing this type of grid with good results.

*

The Schaffer Poidometer

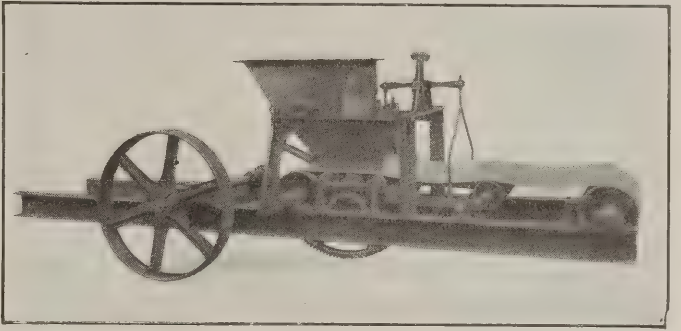
One of the most recent developments in continuous and automatic weighing machinery is the poidometer. This device is both a continuous weigher and a regulator. It is consequently of much advantage in many lines of manufacture where the machines can be arranged in batteries to automatically assemble a number of different materials in accurate proportion. These machines are thus of particular advantage at coke plants where it is necessary, in order to obtain best results, to mix several different kinds of coal.

In such a case each machine is arranged to handle a particular grade of coal at a given rate, and should any one of the machines run out of material to handle, it would not only itself stop, but stop the others.

The poidometer consists of an endless belt traveling over a head and tail pulley and supported in the center by a ball-bearing roller which is mounted on a scale beam. A system of levers attached to the scale beam operates a special gate mounted on rollers. These rollers travel on small tracks inclosed in a cast-iron housing, which is attached to the front of a special hopper, which is arranged for attachment to a bin.

The bottom of the hopper is fitted with gravity wearing shoes which are in contact with the belt. The opening in the bottom of the hopper where the shoes are attached is wider in front than it is at the back. Thus the belt in passing under it has the action of pulling the material away from the shoes and prevents it from dragging under. A subgate is placed in front of the hopper to prevent the pressure of the material coming against the regulating gate. The hopper is also provided with an agitator which prevents clogging of the machine.

The regulating gate is fitted with a double metal joint and is connected to the walking beam by pivoted points. The walking beam, the connecting-rod between the walking beam and the scale beam and the scale beam, are all mounted on knife edges, the scale beam also carrying the ball-bearing roller, which is located in the center of the distance between the last supporting roller under the hopper and the end pulley. This roller supports the belt and operates the regulating mechanism with the least possible amount of friction. The length of the scale beam and the weights employed are so proportioned that the weights will produce the number of pounds per foot of belt indicated by the figures upon them. These weights may be changed and adjusted so as to give any desired delivery within the limits of the machine. When any machine for any reason does not receive material it makes an electric contact and stops all the machines in the battery.



THE POIDOMETER

The regulating and recording device is attached to a measuring drum placed under the belt directly in front of the driving pulley. This drum measures off the exact travel of the belt and operates the counting and tabulating mechanism. It also actuates a device for automatically stopping the machines when a predetermined quantity has been delivered. The device may be set for different amounts or quantities of delivery. To facilitate assembling materials into batches, a controller is provided which will automatically stop and start the machines at intervals. Thus any predetermined number of pounds of different materials may be assembled into a batch containing the exact amount of each ingredient every time. The interval for the machines remaining stationary after the batch has been assembled can be regulated to suit the time that is desired between batches. After this time has elapsed the machines will automatically start and assemble another batch with the same number of pounds of each ingredient as before.

The machine is mounted on a steel channel frame which may be extended when necessary to suit conditions. The driving machinery is all mounted on this frame, and the speed reductions are such that the machines can be connected direct to a line shaft or motor. Where a number of machines are installed in a battery they may all be actuated from one central drive.

These machines are built in five different sizes, ranging from 14 in. to 36 in. in width, and the capacity range is from 1½ lb. per min. up to 5 tons per min. They are guaranteed to give an accuracy of 99 per cent. The poidometer is patented by J. C. Schaffer and is built by the Schaffer Engineering & Equipment Co., of Tiffin, Ohio.

Editorials

No Consignment Coal from Southern Illinois

In times past a great deal of consignment coal from southern Illinois mines was forwarded to Western distributing centers and sacrificed regardless of price. This coal was usually consigned to jobbers with instructions to effect disposition at any figure in order to obtain immediate cash for payroll requirements. Two companies guilty of this practice in past years have been obliged to shut down their operations, and the balance of the field has kept free coal absolutely off the market this season. This has been a most important factor, in the face of the dull summer demand, in maintaining prices for southern Illinois coals. The companies which indulged in the practice of shipping consignment coal are now bankrupt, because as a rule this was sold below the cost of production.

In some of these mining districts, when surplus coal is now accumulated, particularly screenings, it is dumped on the ground awaiting a favorable turn of the market for reloading and shipment against bonafide orders in hand. This maintains a much more healthy condition than was the case with the old method of shipping consignment coal to jobbers to be sold at any price.

⁂

Egyptian State Ry.'s Contract

American shippers would find it difficult to conform in all respects to the coal "specification" sent out by the Egyptian State Railways and Telegraphs. Besides the items noted in another column, summarized from the ten quarto pages of the pamphlet issued, there are certain stipulations that sound rather drastic. The strike clause, for example, gives the right either to cancel the unfilled portion of the contract or to compel the contractor later to make good the deliveries which would otherwise be made were no strike in force. Purchases in the open market can be made for account of the contractor when in the judgment of the buyer there is failure to deliver in season.

It is also interesting to note that the buyer reserves the right not only to reject coal at the loading port and to require cargoes to be loaded in daylight, but that if the cargo is made up from more than one colliery the inspector can have the coal from each colliery sampled separately and each regarded as if it were a separate cargo. The tests, however, are to be made before shipment. Only coals like those from the Fairmont, W. Va., district would be eligible, anyway, because of the volatile requirement. On the point of ash the specification is not so exacting.

It is almost amusing to observe that while chartered bottoms are to be loaded by the Welsh contractors "with the utmost possible dispatch," they must in any event load a 5000-ton steamer within 180 hr., or nearly 8 days if 24 hr. is a working day, "time occupied in bunkering not included!" With loading at Hampton Roads at the rate of 7280 tons of cargo and 189 tons for the bunkers in 2 hr. and 45 min. there should be no difficulty in meeting this condition.

With freights at $11@12 to Mediterranean ports, the deposit required is quite excessive. And with the further provisions that settlements are to be made "check on London" when cargo is discharged, payment of freight to be arranged by the shipper, and the limit as to size of ships, it seems unlikely that American shippers will be enthusiastic about this particular business in Egypt. In future years, if additions are made to the American steamers now being built for the Mediterranean trade, it may be that conditions will be modified and that American shippers will be successful competitors for such contracts.

⁂

Some Notes on the Western Coal Rates

The recent decision of the Interstate Commerce Commission grants advances in rates from Illinois mines to Northwestern points of 5c. to 10c. per ton. At the same time there is no provision for advances in rates on coal moving from the docks at the head of the lakes to the same points. It is thought that some of the railroads, recognizing the unfortunate results of checking in these advanced rates, may feel inclined to waive their privilege unless such advances can be made to apply on competitive coal from all other districts moving into the common Northwestern markets. It is currently reported that most of the carriers serving the mines in Franklin and Williamson Counties have informally told the operators of those districts that they will not take advantage of these increased rates, for the time being at least.

The prices received in later years for fine coal from Illinois mines bring much more revenue to the coal companies than formerly, when slack was practically without a market. The carriers have never received proper compensation for hauling any grades of coal, and the commission apparently believes that they should now be favored in a substantial way. They hold to this opinion irrespective of the competition from lake coal and the fact that the Northwestern States are the more logical market for southern Illinois coals than the Eastern product from West Virginia, Pennsylvania and Ohio moving via the docks. Inasmuch as Commissioner Daniels dissented vigorously from the decision of the other members of the commission and states in substance that the question was not decided upon its merits, it is strongly hinted in certain quarters that a rehearing of the whole case is not only possible but necessary in fairness to Western coal producers.

This is the second advance in freight rates on coal moving from Illinois mines to Northwestern points in the last three years, and most of the Illinois operators would not object to the recent increase, and think it would do no damage, if the carrying charges on dock coals were advanced proportionately. A close analysis shows that the average increase is a fraction less than 10c. per ton. The territory affected is that west from Chicago to the Rocky Mountains, except South Dakota points. As the case now rests, a large amount of business to Northwestern points will be absorbed by the docks and taken away from the Illinois and Kentucky mines. The decision is of some benefit to the Iowa producers who ship coal into outlying points of Iowa, southern Minnesota and Nebraska.

The Reduction in Anthracite Freight Rates

The recent order of the Interstate Commerce Commission directing the coal-carrying roads to reduce the rates of freight on anthracite seems to have been based by them on their finding that "anthracite coal is a low-grade commodity" compared with other classes of freight. Of course it is not likely to find all interests in agreement on this point, but inasmuch as the commission has spent three years in arriving at this conclusion, it is certainly reasonable to suppose that they have gone into the question with greater care than anyone else except the railroads, and for that reason their finding must be given its just valuation.

It is extremely difficult to forecast the probable effect of the decision, for the reason that its provisions will not likely be operative for a few years. That the order will be appealed, goes without saying. As a matter of fact, the various railroads concerned have already met to determine jointly what action they will take. There are some who will even criticize as collusion the fact that the attorneys of the various roads have dared to meet and discuss this subject among themselves. However, when it is remembered that the action for a reduction of rates was brought against the railroads jointly it will be seen that there was practically no basis for any such adverse comment.

The source of appeal on a point of law is to the United States Supreme Court and the manner of the appeal is the only question to be considered by the railroads, and it is not at all certain that the railroads will be a unit on this point. This is because the order affects some roads to a very much greater extent than others. For instance, the Delaware & Hudson and Ontario & Western R.R. declare that the proposed rates as affecting their respective companies are so drastic as to be practically confiscatory, and it is on this ground that they are likely to make their appeal.

In making its decision the Interstate Commerce Commission probably had in mind the order of the recently created Pennsylvania Public Service Commission, which a year ago ordered the railroads to make a reduction of 40c. per ton on anthracite to Philadelphia and vicinity. As is well known any order of the national commission has no effect on intrastate traffic, and the present order of the interstate body seems practically to equalize the intrastate and interstate rates. For this reason the supporters of the Pennsylvania commission point to the order of the Interstate commission as confirmation of the Pennsylvania action. The Pennsylvania decision is in abeyance at this time, having been appealed by the coal companies, but those who favor it are now satisfied that it will be upheld.

The people who are apparently most satisfied with the rate orders are the coal dealers and the individual operators. The former declare that their present profit is so small as to almost preclude the possibility of putting the retail coal business on a basis commensurate with other profitable mercantile enterprises, while the individual operators claim they will now have a fair field in competition with the railroad-controlled companies who produce approximately 80 per cent. of all the anthracite coal now being mined.

This leaves the consumer entirely out of the calculation. It is barely possible should the new rates really become effective that he will be benefited, but it is also absolutely certain if the drain on the carrying roads by reason of the new rates should be such as to financially hinder them the consumer will be the man to bear the burden—not in a feeling of revenge, but because of absolute necessity; for it is no more possible to operate a transportation line without an adequate income than it is to run the ordinary corner grocery without any return.

For the time being, so far as the consumer and retail dealer are concerned it is a waiting game; but for the others it is a time of incessant action. It is possible that pending the appeal the retail dealer may receive some rebate on all freight paid from the time the new order becomes effective. This was the course followed in the appeal from the decision of the Pennsylvania Public Service Commission. The railroads entered bond to repay the difference should the rates be decided to be in accordance with law.

This latest decision is only another proof that the transportation business of the country is in a transitory state, and it is sincerely hoped by everyone concerned that the end of the unrest is in sight and that the final adjustment will be such as to conduce to the equity and satisfaction of all concerned.

The Shake-Up in the Middle Western Freights

Anthracite shippers are uncertain as to the results which will follow the recent decision of the Interstate Commerce Commission in which an advance of 25c. in the rate to Chicago territory was approved. So far no changes have been made in prices, but some jobbers look for an early advance on the part of the wholesalers to absorb the increased freight rates.

The outcome of the recently developed bituminous rate situation is also problematical. This increase becomes effective Sept. 30. The docks will undoubtedly benefit from this decision as it now stands, but so far the Western carriers show no disposition to take advantage of the decision and advance rates, as to do so would mean a falling off in the heavy and increasing tonnage from Illinois and Kentucky mines.

The roads do not seem to know what course they are going to pursue, which has made future plans of the operators uncertain. The next six weeks should see a considerable volume of increased shipments at the lower rates now in effect. If these rates are effective beginning Oct. 1, Western operators will have a smaller selling zone, which means congestion of tonnage and lowering of prices. What readjustment will be the outgrowth of this verdict is problematical.

First-Aid Contest in Crowsnest District, British Columbia

By E. Jacobs*

For years instruction has been given in first aid in the coal-mining centers of British Columbia, and as a result there are at every operating coal mine many men competent to render first aid in any emergency. Last year Dudley Mitchell was appointed instructor in first aid for the Provincial Department of Mines. He has since that time aided in organizing first-aid classes, not only among metalliferous miners, but also among those working in coal mines. He has also given instruction in the use of oxygen-breathing apparatus and the pulmotor and has trained the corps in mine-rescue work generally.

FERNIE TEAM WHICH RECEIVED FIRST PRIZE

FERNIE TEAM OF BOYS LIFTING PATIENT OVER OBSTACLE

This team won the first prize for juvenile contestants and did excellent work. Note how careful they are not to jar patient

Classes for instruction in first-aid have been organized at Corbin, Michel, Fernie and Coal Creek, in the Crowsnest district; at Merritt, in the Nicola district; and at Ladysmith, Extension, South Wellington, Nanaimo, Cumberland and Bevan, all on Vancouver Island. Between 300 and 400 persons, in all, attended these classes, and more than one-half of those who took the full course afterward passed the prescribed examination entitling them to the certificate of competency of the St. John Ambulance Association, which certificate is recognized in all parts of the British Empire.

For some time past active interest has been taken in the first-aid movement by W. R. Wilson, of Fernie, general manager for the Crow's Nest Pass Coal Co., and the superintendents and other officials of that company's many coal mines and coke-oven plants. About three months ago a first-aid contest was arranged to be held at Fernie early in July, and representatives of the Coal Creek and Michel collieries and the coke plants at Michel and Fernie met and adopted rules under which this contest should be held. Meanwhile the first-aid men practised zealously, and enthusiasm spread throughout the three camps, until when the various contests were held there was an attendance of 800 or more to witness the efforts

EXECUTIVE COMMITTEE, ST. JOHN AMBULANCE ASSOCIATION, CROW'S NEST PASS CO.

TEAMS OF FERNIE AND MICHEL MINERS CONTESTING AT FERNIE, B. C., IN A FIRST-AID MEET

of the competitors, and this, too, notwithstanding that the weather was rainy.

Michel sent four adult teams, and Coal Ceek three and also one of boys, while Fernie was represented by four teams of men and one of boys. As each team consisted of four competitors and a patient, there were 55 men and 10 boys taking part in the contest.

MEN'S CONTEST

The men's teams representing Michel colliery were captained respectively by A. R. Stacy, R. L. Spruston, J. Touhey and J. March; those of Fernie by J. Hamer, W. Hunter, J. Monks and J. Taylor, and those of Coal Creek by E. Harrison, J. Caulfield and R. Johnson. A first prize of $50 and a second of $25 were offered for competition by these teams. A Fernie team consisting of J. Hamer, captain, C. McNey, A. Bunch, W. Whalley, and R. D. Winstanley, patient, won the first prize.

COAL CREEK TEAM CARRY PATIENT UPSTAIRS

Notice the interest shown by the "kiddies" in the rear, showing how popular is first-aid

For the second prize the competition was so close that the judges decided that one of the Michel teams and one from Coal Creek were equal, so each was awarded $25. The members of these teams were as follows: From Michel, A. R. Stacey, captain, C. J. Tyler, W. J. Spruston, W. Touhey, and J. Horrocks, patient; from Coal Creek, E. Harrison, captain, Isaac Haile, J. Millburn, W. M. Branch, and James Young, patient. The judges for this competition were Doctors Bonnell, Burnett, Corsan and Moore.

BOYS' CONTEST

A first prize of $25 and a second of $15 were offered for competition by boys' teams. There were only two entries—one team from Fernie and one from Coal Creek. The first prize was won by the Fernie boys, who were: A. Woodhouse, captain, C. Stockwell, H. Quince, A. Rees, and T. Baker, patient. The second prize fell to the Coal Creek team, consisting of J. France, captain, A. Branch, J. Cartmell, H. Hartley, and H. Evans, patient.

After the contest, W. R. Wilson gave a dinner to all members of the first-aid classes of the St. John Ambulance Association; for the Fernie and Coal Creek men at Fernie and for the Michel men at their own home town. A concert followed the dinner at Fernie, and the day's proceedings terminated with a general resolve to make the first-aid contest an annual event.

The record of the employees who attended classes of the Crow's Nest Pass Coal Co. and passed the examinations in first-aid conducted by the St. John Ambulance Association is as follows:

	First Year (Certificate)	Second Year (Voucher)	Third Year (Medallion)	Fourth Year (Label)	Total Qualified
Michel..........	13	6	1	3	23
Fernie..........	59	2	1	1	63
Coal Creek......	42	7	1	3	53
Total........	114	15	3	7	139

Taking the total number of employees at approximately 2000, it will be seen that the result of this year's instruction is that there is among the company's workmen one man trained to render first-aid for every 14.3 men employed.

Workmen's Compensation and Coal Mining

A new method has been adopted by a group of well-known casualty-insurance companies for inspecting and rating the relative value of each hazard which goes to make up the total accident risk in a coal mine. Perfection of the method adopted has necessitated the establishment of standards for each separate safety measure which may be adopted in coal-mine operation. Every risk within the mine which is less imminent than the standard will earn a reduction in the base premium rate adopted for the state, and those operations in which the risks are more threatening than the standard will be required to pay a higher annual premium for the insurance of their workmen.

MAKING SAFETY PROFITABLE TO THE OPERATOR

In other words, coal-mine operators who are endeavoring to appraise their respective liabilities under workmen's compensation may change their unknown obligations in this regard into fixed known liabilities by insuring themselves against their risks. They will be given by the agencies of insuring companies a base rate. A careful and scientific inspection will then be immediately made of the mine by an experienced mine inspector, and he will rate each element of risk in the mine as being above or below the standard adopted. There will result therefrom a merit or schedule rating which may materially reduce the amount of premium that the mine owner will have to pay for insurance under workmen's compensation, or it may increase it, thereby offering the owner in the form of a premium reduction a monetary incentive to make his mine more safe.

It is evident that here is a new and benign influence in the mining industry which will increase safety in mining and make corporations realize that the price of safety must be expended whether in payment for insurance or in outlay for safety. This will make all companies face the question squarely and prevent operators who do not have a due sense of their duty from underbidding those who expend large sums to keep their mines in safe condition.

Department of Inspection and Safety Formed

As an evidence of good faith to the mining industry and to such mine owners as may insure with the associated companies, the latter have organized as their medium of doing business a department of inspection and safety, and as an evidence that this department is to be conducted on thoroughly scientific and practical lines and so far as possible in the interests of and in full coöperation with all elements of the mining industry, they have secured as director of the department the services of Herbert M. Wilson, formerly engineer in charge of the Pittsburgh experiment station, United States Bureau of Mines.

Mr. Wilson's long association with the late Dr. Joseph A. Holmes, director of the Federal bureau, his well-known interest in safety in mining, the coöperative spirit which he has heretofore shown in dealing with mine operators, mine workers and state inspectors, and his wide personal acquaintance with men interested in the mining industry assure the adoption of a system of mine inspection which should be of great assistance to the mine owner as an auxiliary to his own inspection and safety measures, as well as one which should develop the most reasonable premium rates commensurate with safe business practices.

This association proposes not only to inspect the mines of the insured for the purpose of fixing rates, but it proposes to reinspect these mines periodically for its own protection and that of the mine owner and so that it may give reduction in premium rates whenever they are earned by the operator's adoption of safer methods. Of equal importance to the insured mine owner is the assurance that the department of inspection and safety will advise him as to methods in which dangerous conditions may be eliminated.

Improvements Made Out of Insurance Savings

Under such a system practically and technically applied the mine owner will be enabled to earn such reductions in the premium rates that the cost of his improvements to assure safety will be returned to him within a year or two by reductions earned in his premiums. Some of the safety methods adopted by corporations, such as additional inspection, are believed to have resulted not merely in reducing accidents, but in improving the product and even in lowering its cost. So some, at least, of the expenditures for accident prevention and part of the cost of insurance will be offset by the economic advantages gained by the precautions taken.

As an evidence of the financial strength behind this movement and its resources for carrying out its work it is only necessary to recite the names of the ten powerful casualty-insurance corporations forming the "Associated Companies" which have pooled their interests for insuring coal mines in compensation states, namely: The Aetna Accident & Liability Co.; Aetna Life Insurance Co.; the Employers' Liability Assurance Corporation, Ltd., of London, Eng.; Hartford Accident & Indemnity Co.; London Guarantee & Accident Co., Ltd., of London, Eng.; Maryland Casualty Co.; the Ocean Accident & Guarantee Corporation, Ltd., of London, Eng.; the Standard Accident Insurance Co., of Detroit, Mich.; the Travelers' Indemnity Co., and the Travelers Insurance Co.

The above plans will be carried out only in those states which have enacted compensation legislation applying to coal mines and where the terms of legislation or regulations will permit stock insurance companies to do business, namely: Colorado, Illinois, Indiana, Iowa, Kansas, Maryland, Michigan, Montana and Pennsylvania.

The methods adopted by this association will not only follow closely the requirements of the best state mine-inspection laws, but also those safe practices which have been developed in the Bureau of Mines. It was with this object in view and in order that this work might be kept in close touch with the mining industry as well as with the Bureau of Mines that Mr. Wilson has fixed his office in Pittsburgh, Penn.

⁂

American Mine Safety Association

The impression seems to have been conveyed by articles appearing in the technical journals that the American Mine Safety Association has ceased to exist. President A. F. Knoefel and Secretary H. M. Wilson give the assurance that this is by no means the case, but that it is not only very much alive, but will be more active than in the past, though under another name.

The recent ballot concerning the amalgamation with the National Safety Council was almost unanimously in favor of such action, and it is said that the executive committee of the latter also favors taking over the American Mine Safety Association as the mining branch. The effect will be to practically centralize all safety movements within the National Safety Council.

The American Mine Safety Association will hold its annual meeting as contemplated in Birmingham, Ala., Sept. 3, and it is expected that it will take a recess to reconvene Oct. 20 at the annual meeting of the National Safety Council, in the Bellevue-Stratford Hotel, Philadelphia, as the mining section thereof. At that time there will probably be elected officers and committees of the mining section for the purpose of carrying on the activities of the American Mine Safety Association along lines identical with those heretofore followed.

In addition the members will receive the weekly safety bulletins of the National Safety Council and its correspondence service on safety subjects, and there will be a decided strengthening of the local branches through the opportunity to include in their activities not only safety in mining, but also in railways, manufacturing industries, public service, etc. Any mine-safety organization should be thus broadened, because the metal-mining industry desires an organization covering mills, smelters and railroads as well as mines.

We are further advised that persons taking out memberships in the American Mine Safety Association prior to the consummation of the proposed consolidation in October will have the privileges of membership in the larger organization for the ensuing year, but at the lesser rate of membership dues called for by the American Mine Safety Association.

Discussion by Readers

The Dr. Holmes Memorial

Letter No. 1—Referring to the editorial in *Coal Age,* July 31, p. 177, entitled "A Memorial for Dr. Holmes," I beg to say that I am heartily in accord with such a movement and believe something of the sort should be done.

Of the two ideas mentioned in your editorial, my preference would be for the book rather than the monument. The monument would be seen by comparatively few, especially of mining men who would be most interested. The book, on the other hand, would be available to every mining man sufficiently interested to want to possess one. The book would give the readers thereof an insight into the life, work, character and personality of Dr. Holmes, which many will be anxious to get and which would otherwise be unavailable. The book, I believe, would be an inspiration to all who read it. I vote for the book.

EDWARD H. COXE.

Knoxville, Tenn.

⁂

Labor in Mining

Letter No. 8—I read with much interest the able support of the United Mine Workers of America by Hugh Archbald, *Coal Age,* July 24, p. 124; but was surprised to find an efficiency engineer advocating a cause whose principles are the antithesis of efficiency in coal mining.

Direct contact with pit committees and the discussion of matters relating to this organization both with miners and operators, together with the reading of the United Mine Workers' *Journal,* technical magazines and comments of the general press, have fully convinced me that the recognition of the union as it is now managed is wrong in principle and against the interests of the operator and general public policy. My conclusions are based on the following four counts:

1. The organization, under its present management, assumes to usurp the functions of ownership of the mine and infringes on the rights of the individual miner.
2. Its tendency is to destroy the discipline of the mine and to hinder the enforcement of the rules and regulations designed to safeguard the work of mining.
3. The methods adopted by the officers of the union to secure their ends tend to foster discord among mine workers, the majority of whom are coerced to act in opposition to their better judgment.
4. The direct result of the application of these principles is a decrease in efficiency in the operation of the mines.

Referring to these counts, singly and in detail, the organization usurps ownership of the mine by depriving the owner or his agents of the right to hire and discharge their employees at will. Mines have been shut down by order of the union because a slate-picker was employed who was not approved by some influential members of the union. In another instance an entire division of the company's mines was closed down because the demand of the union for the discharge of the district superintendent was refused. The superintendent in question was a man of the highest technical ability and character. Other mines have been shut down for the discharge of members of the union for the willful violation of mining rules and regulations.

The organization infringes on individual rights by forbidding superintendents and foremen to make any agreements with a miner in their employ that is not sanctioned by the scale. For example, at a mine in the West under my charge the scale was $3.10 for an 8-hr. day. It so happened that the boarding boss—a man who had never been in a mine—was promised a job when a vacancy occurred that he could fill, and as a result was employed a little later as a car-greaser. His pay was $3.10 a day, according to the scale. Shortly after, the inside mechanic said to me: "It looks mighty hard for a man who has worked in a mine since he was eight years old to draw the same pay as that old plug who never saw the inside of a mine till yesterday." I replied: "Nick, what you say is true. The car-greaser's job is worth but $2 a day, and the man would be glad to take it at that, while your work is worth more than the scale paid. If I was free to do as I pleased, I should pay you $4 a day and the old man $2 a day, and everybody would be satisfied; but your committee says, 'Pay every man the scale, whether he is worth it or not.' "

Where the scale exceeds a minimum wage, the company must in self-defense make that the maximum wage; and as a result I have seen every man make a maximum day's loading. I remember a large mine where the turn was limited to four cars to each miner. When he had loaded that number, he could load no more. Mr. Archbald discussed this point in a previous article, *Coal Age,* July 10, p. 48. Absolute impartiality in all dealings with employees is a prime qualification of a mine foreman or superintendent, and plain justice demands that each and every miner be given an equal opportunity to load coal and that the scale should discriminate between the mining of pillar coal and the driving of rooms and entries.

In the fixing of a scale, regard must be had to the interests of the operator as well as those of the miner. The efficient operation of the mine requires that every miner be allowed to put out as much coal as he can load, the turn of cars being distributed so that each man is encouraged to make his time, skill and strength tell to the best advantage. The principle of equality of pay at a given mine can be applied only by holding back the steady, industrious and skilled workman so that he does not rise above the level of the one less steady and skillful. It would be a hard proposition to raise the latter person to the level of the former. The miners' organization does not attempt to do that.

In respect to the work of the organization destroying the discipline in a mine, it is only necessary to consider how the authority of the foreman or superintendent is curtailed by the fear of precipitating a strike by the discharge of an employee for suitable cause. Any abridgment of the power to discharge an employee seriously impairs discipline in any industry. By their opposition to many rules and practices designed to safeguard the work of mining or to the discharge of men for violation of rules, the organization has handicapped mine discipline. Such opposition has frequently rendered a good rule inoperative. According to statements in the press, the fines of members convicted of violating rules have in some cases been paid by the organization. Mines have been closed down because shotfirers did not fire shots that in their judgment were unsafe. The opposition by the organization to the use of permissible explosives is too well known to require more than passing mention.

In deciding the value of the organization to the miner, the question may well be asked, What has it done to advance his standard or to lift him to a higher level? The union displays no pride in the attainments of its members and makes no endeavor to raise the standard of vocational excellence. It does not attempt to increase the miner's earning power by increasing his knowledge and efficiency as a workman. It makes no effort to purge its rolls of the inefficient or vicious. Its membership card is no guarantee of the ability of the holder to perform work in the mine. Instead of striving for these attainments, its whole endeavor is simply to increase its membership, so as to enforce its demands by virtue of its numbers and not by merit.

Compare these conditions with the work that has been done during the past 20 years to raise the standard of technical excellence and personal integrity among mine superintendents, foremen and other mine officials. This work is still being pushed, and each year the standard is raised to a higher degree of excellence. Has the advancement of the miner during the same period kept pace with that of mine officials?

In considering further the right of the organization's claim to support, it is unnecessary to remark that no corporation can preserve its administrative power and divide its authority with another organization or committee. As a matter of public policy, any organization assuming to control industrial affairs to the extent that the United Mine Workers have attempted should be incorporated under the laws of the land, so that its acts may be subject to review by Federal boards and commissions, in the same manner as the railroads and other public utilities are controlled. All thinking men realize that the day of absolutism is fast passing, and the time is not far distant when labor unions will not be exempt as now from the application of trust laws. When labor unions become corporate institutions and claim no privileges not extended equally to organizations of capital; when they set up higher standards of vocational excellence and truer ideals of citizenship; when a union card bears some evidence of the fitness of its possessor; when union contracts are kept inviolate—then and only then will these organizations command the respect and support of the public and receive recognition by corporations.

Since leaving college, my life has been spent in mining camps, where I expect to stay. I have shared the bucket and bunk of the miner and know that many of the world's uncrowned heroes are to be found in his ranks. I am interested in the vocational excellence and skill of the miner as a fellow-workman and in fullest sympathy with every movement to increase his safety and comfort in the mine and improve his living conditions. I desire his uplift, both as an individual and as a class, but no plans to this end will succeed unless the man himself is reached and taught his individual responsibility and the value of his personal work and efficiency to the general community in which he lives.

Augustin, Ala.

Prohibition and Welfare Work

Letter No. 3—In reading the article entitled "Prohibition from a Miner's Viewpoint," *Coal Age*, July 17, p. 80, one is surprised at the question of its author. He asks, "Are we doing right by these miners?" At times I have been inclined to think that there is a certain amount of coddling indulgence permitted in our welfare work among the foreign-speaking miners.

The writer of the article to which I have referred has well suggested that "if you would put an end to a habit of any kind in men, women, or children, you must give them something in place of it." Among the foreign element in our mines the men worthy of uplift efforts in their behalf will suffer no hardships by reason of the prohibition movement that is so steadily gaining ground in many mining districts.

The thoughts and interests of this class of miners when they are deprived of their booze will seek another channel. The man who is worth while will not long regard as a loss what he knows never did him any good. He will be quick to embrace other diversions now offered in so many mining towns as a result of the earnest efforts of the Y.M.C.A. These diversions consist chiefly of reading rooms and classes, with the added attractions of bowling, billiards, ball and tennis grounds, swimming pools, etc., whereby he is enabled to pass his idle hours in a pleasant and and profitable manner. The associations thus afforded bring him in contact with forces that will educate and lift him to a higher level.

I do not mean to say that this will be the result in every individual case; but while some drift away, like "Steve" and "Martin," whose letters written from West Virginia to the Ohio superintendent have been quoted, men who are worth while will stick to their jobs and attract to the mine a better class of workers. It must be remembered that a smaller number of orderly, industrious, steady-working, sober men will prove more efficient and produce better results than a larger number of noisy, carousing men who are idle much of the time, and are sullen workers at the best.

It is rightly conceded by the author of the article that "West Virginia coal-mine operators have done much for the uplift and social betterment of the mine worker"; but, as he states, "much remains yet to be done." That the coal-mine operators of West Virginia consider statewide prohibition as the greatest stride yet made in welfare work is evidenced by the active interest they showed previous to the election that resulted in a dry vote being passed. And since the passage of this law they have made every effort to encourage the enforcement of the dry laws in their own communities.

Following up, as they have, this master stroke of state prohibition with the steady development of many uplifting agencies, such as first-aid teams, athletic teams, prize gardens, night schools, etc., instituted by individual companies, the West Virginia coal operators are not likely to experience much difficulty in obtaining a higher and more permanent class of labor. In closing, I desire to quote a paragraph from a recent issue of the *Journal* of the American Medical Association, which states clearly the average coal operator's conception of general welfare work. It is as follows:

> Human life is gradually becoming recognized as a business asset. This is a new fact in the development of the race. Life insurance companies are realizing that they can increase their dividends faster by cutting down the death rate than by increasing sales or by reducing expenses. Employers of large numbers of human machines are realizing the surprising fact that as a cold business proposition it pays—not in sentiment but in dollars—to take good care of their employees. Business men are learning that well-fed, well-clothed, contented men and women, working in well-lighted, well-ventilated quarters and on schedules arranged in accordance with our modern knowledge of psychology and physiology, actually turn out more work and better work than underpaid, discontented help, working under unhealthful and uncomfortable conditions. Therefore large corporations are spending money liberally in playgrounds, restrooms, libraries, gymnasiums, sanitary lunchrooms, moving-picture shows, safety devices, ventilating systems and similar devices for the well-being and enjoyment of their employees.
>
> If one asks these men why they are doing these things, they will disclaim any charitable or philanthropic motives. "This isn't charity," says one firm; "we want that clearly understood. This is simply good business management and common-sense. A well man is worth more to us than a sick man. A happy, contented woman turns out more work and better work than an unhappy one. Therefore, anything we can do to make the people who do our work feel at ease in mind and body we regard as good business management, just as we regard fire insurance, improved machinery and labor-saving devices." The firms that have realized the enormous importance of this discovery are already reaping the benefits. The conservation of the health of employees will be a fundamental principle of good business management in the future.

The foregoing citation from an outside source shows the appreciation of others for the efforts of the operators in the state.

⁂

Mining Laws and Legislation

Letter No. 9—Referring to the controversy between Thomas Hogarth, Letter No. 4, *Coal Age,* June 5, p. 988, and I. C. Parfitt, Letter No. 6, July 31, p. 183, as to the relative responsibility of the mine foreman and his assistants, I agree heartily with Mr. Parfitt that the mine foreman is and should be responsible for the acts of his assistants. I believe this to be true whether the assistant in performing any specific act is doing so as a result of specific instructions or otherwise.

Speaking of the foreman, Mr. Hogarth says, "He can be held responsible only for the orders he issues and for the employment of those he believes to be competent men to act as his assistants." I would take strong exception to this statement; first, because I believe the foreman should be responsible not only for the orders he issues, but also for the carrying out and enforcement of those orders to the extent if necessary of removing an assistant who fails to do so; and second, because one of the requisite qualifications of a good foreman is that he shall be a good judge of human nature, and if in the employment of an assistant whom he believes to be competent he errs in his judgment of the man, he and no one else should be held responsible for his error of judgment.

Every one around a mine has certain responsibilities, and every employee in a measure shares the responsibility of his immediate superior, but in my humble opinion the ultimate responsibility for the safety of the men and the enforcement of the law rests wth the foreman, who is or should be responsible for every act of every man he appoints to a position of trust or authority, whether or not such acts are the result of specific instructions. In like manner the superintendent is responsible for the acts of the mine foreman he appoints, except in matters for which the law holds the foreman responsible—a responsibility he cannot escape.

Knoxville, Tenn.

⁂

Education in Mining

Letter No. 2—I have noticed many references to the need of the education and training of miners, but it seems to me that there is not sufficient attention given to the working out of a practical scheme. Since the letter of A. M. Iner, *Coal Age,* June 26, p. 1112, I have seen no practical method suggested for interesting the great mass of miners in the matter of their own education and training, by means of which they could do better work and increase the safety of mining. Some good suggestions have been made in discussing welfare work—and recently the question was raised as to whether the coal companies, which are spending large amounts in this direction, are receiving adequate returns for their efforts.

In discussing the question of education, various reasons are generally given for its necessity, such as the reduction of mine accidents, the securing of more efficient workmen, more regular work, increased output of coal and greater harmony of operators and employees resulting in the avoidance of strikes and lockouts.

One point that has not been mentioned, however, seems to me an important one. I have observed that the educated miner will generally do quite willingly what he is told and will do it promptly like a trained solder or seaman whose duty it is to obey orders. In the same way, a good citizen, a member of the community, must obey the laws and bear his share of the common burdens. On the other hand, I have observed that the uneducated and untrained miner fails to realize his personal responsibility as one of the mine workers, and if he does at all what he is asked or told to do, it is because of compulsion.

Ask an educated miner to stop loading a car and set some timber where it is needed to support the roof, and the chances are nine out of ten that he will do so at once, and you can pass on to the next place without feeling that you must return to see that your orders are obeyed. But the uneducated and untrained man, when ordered to set timber in his place, will tell you he does not have to, or if he promises to set the post, he will delay doing so, making it necessary for the foreman to watch him and stay around until the work is done.

The educated miner is a successful and independent worker, relying on his own ability as a miner. The untrained man is prone to regard himself as one of an organization of workers whose welfare will be protected by union contracts, which are his main reliance. Reference has been made to the fact that many coal miners are prone to regard every effort of the company that is put forth in their behalf as an attempt to further their own ends by securing more work from the miner. They are unwilling, for the most part, to think that these efforts are unselfish and intended for their good. The large majority refuse to attend the night schools that are established and supported by many coal companies, explaining their indifference by many reasons.

The endeavor to improve mining conditions through the channels of education and training of mine workers meets with more success among the children. For this reason, our greatest efforts should be made in their behalf. Even here, objection is frequently made by the parents that they need the help of their children to support the family and that their small earnings will not permit them to send the children to school. In a few cases the claim has been made that the miner wants nothing free, but is able to pay for all he gets and will not send his children to a free school. But observe that if a charge was made for tuition at a school supported by the company, it would be styled by the same men as "robbery." So the work among children is not an easy proposition, and yet it is more hopeful than that among the older classes.

In this connection I want to suggest that there might be a system of education undertaken by the state, independent of the coal companies, which are always regarded as working from an interested standpoint. In the agricultural field the Government undertakes the education and training of farmers, generally, by sending men out through the country to demonstrate the best methods of growing grain and other products and of preserving the qualities of the soil by the rotation of crops. Why should not the coal-mining industry be entitled to similar benefits designed to educate and train mine workers. The coal-mining industry is entitled to its share of benefit at the hand of the Government as well as the agricultural interests of the country. In making this suggestion I do not want to be understood as not appreciating the efforts made by individual coal companies. I simply want to suggest what might prove a more effective method of dealing with the indifference shown by mine workers to their own education and that of their children.

Speaking of the education of children, if they could be instructed in the science and principles of technical mining, up to the age of 16 years, we might confidently expect that they would enter the mines as efficient and safe workers, and the need of night schools for older men would disappear in a few years. It would be a grand thing if young men could enter the mines as trained workers and know how to lay a shot, handle a safety lamp, understand its construction, know the use of the barometer and other instruments, and understand how to put up sights in a mine or figure out a problem in ventilation. Let our efforts be put forth to work out this problem in a successful way.

OSTEL BULLOCK.

Cleaton, Ky.

Study Course in Coal Mining

BY J. T. BEARD

The Coal Age Pocket Book

Relation of Drop in Temperature to Altitude—Approximately, the fall in temperature (t), in the atmosphere, varies as the 1.4 root of the height (h) above the sea level; thus,

$$\frac{t_2}{t_1} = \sqrt[1.4]{\frac{h_2}{h_1}}$$

Applying this principle and assuming a temperature drop of 6 deg. at an altitude of 1000 ft. above sea level, the mean average temperature (t), for any altitude (h), expressed in thousands of feet, can be calculated approximately thus:

$$t = 60 - 6\sqrt[1.4]{h} + \frac{2}{(h-2)^2}$$

This formula assumes a normal sea-level temperature of 60 deg. F., which is the first term in the second member of the equation. The second term of this member accounts for the fall of temperature corresponding to the increase of altitude; while the third term expresses the effect of the radiation of heat from the earth, which varies inversely as the square of the altitude factor h—2, probably owing to the influence of clouds or vapor in the lower atmosphere.

Example—Let it be required to find the temperature, at an elevation of 8000 ft. above sea level, corresponding to a normal temperature of 60 deg. at sea level.

Solution—In this case, the altitude expressed in thousands of feet is h = 8; which substituted in the formula gives:

$$t = 60 - 6\sqrt[1.4]{8} + \frac{2}{(8-2)^2} = 33.5 \textit{ deg. F.}$$

The mean observed temperature for this altitude as given in the table is 32 deg. F.

Average Temperature of Air Column—The average temperature of the air column extending from sea level to any altitude h expressed in thousands of feet, can be calculated with close approximation by the formula

$$\textit{Average temp.} = 60 - 3\sqrt[1.28]{h}$$

The mean average air-column temperature, as calculated by this formula, can be used to find the corresponding normal atmospheric pressure by substituting its value in the formula

$$p_h = 14.696\left(1 - \frac{1}{53.28\,T}\right)^h$$

The use of this formula will require a table of seven-place logarithms or more. In the solution of the following example, a ten-place logarithmic table was employed.

Example—Find the mean average air-column temperature corresponding to a sea-level temperature of 60 deg. F., for an elevation of 12,000 ft. above the sea.

Solution—In this case, h = 12, which gives for the mean average air-column temperature

$$\textit{Average temp.} = 60 - 3\sqrt[1.28]{12} = 39 \textit{ deg. F.}$$

The absolute temperature is 460 + 39 = 499 deg. F., abs.

The Coal Age Pocket Book

Example—Calculate the normal atmospheric pressure for an altitude of 12,000 ft., using the mean average air-column temperature found in the last example, T = 499 deg. F., abs.

Solution—Substituting the given values in the formula gives for the normal atmospheric pressure at this altitude,

$$p_{12,000} = 14,696\left(1 - \frac{1}{53.28 \times 499}\right)^{12,000} = 9.359 \textit{ lb. per sq.in.}$$

The Differential Method—The pressure of the atmosphere, per unit area, at any altitude x is due to the weight of air column above such point of observation. Air being compressible, any increment of pressure (δp_x), causes a corresponding minus increment of height (—δx); and, calling the unit weight of air w_x at the altitude x, we have

$$\delta p_x = -w_x\,\delta x \qquad (1)$$

But the unit weight of air varies with the pressure it supports. Hence, calling this unit weight and pressure at sea level w_0 and p_0, respectively, and that at any altitude x, w_x and p_x, we have

$$\frac{w_x}{w_0} = \frac{p_x}{p_0}\text{; and } w_x = \frac{w_0}{p_0}\,p_x \qquad (2)$$

Substituting this value in equation 1 and dividing both members of the equation by p_x, gives

$$\frac{\delta p_x}{p_x} = -\frac{w_0}{p_0}\,\delta x \qquad (3)$$

But, the differential of a quaitity divided by the quantity is equal to the differential of its Naperian logarithm.

Hence,
$$\delta \log p_x = -\frac{w_0}{p_0}\,\delta x\text{; or } \delta x = -\frac{p_0}{w_0}\,\delta \log p_x \qquad (4)$$

Then integrating between the limits x = 0, and x = h, remembering that when x = 0, $p_x = p_0$; and when x = h, $p_x = p_h$, and subtracting the lower integral from the higher,

$$h - 0 = \frac{p_0}{w_0}(\log p_0 - \log p_h) \qquad (5)$$

But the unit weight of dry air at sea level, normal atmospheric pressure (lb. per sq.ft.), is

$$w_0 = \frac{p_0}{53.28\,T}\text{; and } \frac{p_0}{w_0} = 53.28\,T \qquad (6)$$

which, substituted in equation 5, gives for the altitude corresponding to any pressure, under normal conditons,

$$h = 53.28\,T(\log p_0 - \log p_h) \qquad (7)$$

Or, expressed in comon logarithms,

$$h = 122.68\,T(\log p_0 - \log p_h) \qquad (8)$$

For normal atmospheric pressure, at sea level, p_0 = 14.696 lb. per sq.in., and log 14.696 = 1.1672; hence

$$h = 122.68\,T(1.1672 - \log p_h) \qquad (9)$$

Or,
$$\log p_h = 1.1672 - \frac{h}{122.68\,T} \qquad (10)$$

Inquiries of General Interest

Standards in Analyzing Coal

Is there a recognized system of analyzing coal, and if so, where can a copy or outline of such method be obtained? In an analysis of coal, do the percentages of the different constituents refer to the weight of each constituent in the coal? What is meant by the heating value of the coal?

R. T. M.

Terre Haute, Ind.

It is generally conceded that the United States Government has worked out a system of analyzing coal that may be properly called a "standard of coal analysis." This system is described by F. M. Stanton and A. C. Fieldner, in Technical Paper 8, Bureau of Mines, entitled "Methods of Analyzing Coal and Coke." Poole's "Calorific Value of Fuels" may also be considered a standard work on this subject. Stillman's "Engineering Chemistry" and Olsen's "Quantitative Chemical Analysis" each give good workable methods for the analysis of coal.

To use any of these outlines, however, one must possess a good knowledge of chemistry. For this reason, I submit the following clear, concise method of analyzing coal, which will prove valuable to those not having a full knowledge of chemistry. In preparing this outline I have omitted all unimportant matters.

PRACTICAL SCHEME OF COAL ANALYSIS

Reduce the sample of coal to be analyzed to a fine powder that will pass through a 60-mesh screen.

Moisture—A gram of the powdered coal is weighed in a platinum dish and placed in a hot-air oven for 1 hr., at 105 deg. C.; then weighed again. The difference is the loss of moisture, and this weight is calculated to percentage.

Volatile Matter—A gram of powdered coal is weighed in a platinum crucible and heated under a bunsen burner, under standard conditions, for seven minutes and weighed again. The difference of loss is the volatile matter plus the moisture; subtract the moisture first found above, and the result is the volatile matter, which is calculated to percentage.

Ash—The gram of coal used for the moisture determination is placed over a bunsen burner and burned down to ash or constant weight. Subtract the weight of the empty dish from this weight and the result is the weight of the ash, which is calculated to percentage.

Fixed Carbon—Add the percentages of moisture, volatile matter and ash and subtract their sum from 100 per cent. The result is the percentage of fixed carbon.

Sulphur—Mix 1 gram of powdered coal with 2 grams of "Eschka mixture," consisting of two parts of magnesium oxide (MgO) and one part anhydrous sodium carbonate (Na_2CO_3), in a large platinum crucible. Cover this mixture with a layer of the Eschka mixture and heat slowly over an alcohol flame for 30 min. Then stir the mixture gently with a glass rod and heat to redness until all the black particles are burned away. Allow the crucible to cool and when thoroughly cold dissolve out the sulphates in hot water and filter the solution. Now precipitate the sulphur as barium sulphate ($BaSO_4$), by adding barium chloride to this solution. Wash the precipitate thoroughly and weigh. Then calculate the weight of sulphur as 0.137 of the barium sulphate precipitate and reduce this result to percentage of the gram of coal taken.

Heat Value (B.t.u.)—This is the only determination not reported as percentage. This value is found by means of a calorimeter, of which perhaps the best standard type is the Atwater-Mahler bomb calorimeter. A British thermal unit is not percentage; but is the amount of heat necessary to raise 1 lb. of water 1 deg. F., at its point of maximum density.

The foregoing determinations will be more easily understood by the lay mind, and though not scientific in some details, they are yet sufficiently accurate for all commercial purposes.

All commercial analyses of coal, except the determination of its heat value, are based on the weight of the sample analyzed, and the weight of each constituent found is calculated as a percentage of the original weight of the sample.

The heat value, or the calorific value, of coal is given in heat units, per unit weight of the coal. For example, a pound of coal having a heating value of 14,000 B.t.u. contains sufficient heat to raise 14,000 lb. of water 1 deg. F. or 140 lb. of water 100 deg. F., assuming there is no loss of heat in the operation.

⁂

The Coefficient of Friction of Treated Belts

Can you give any data showing the effect of treating belts with "Cling-surface" to increase the friction?

ENGINEER.

Cleveland, Ohio.

In answer to this inquiry N. G. Near writes as follows:

In connection with Robert Thurston Kent's recent tests on belts, where he used a belt treatment on one belt and none on the other, I have made computations for the coefficient of friction under both conditions from the old belt formula

$$Log\,\frac{T_2}{T_1} = \pm 0.4343\,\mu a$$

where μ = the coefficient of friction; a = arc of contact; T_2 = tension on tight side; T_1 = tension on slack side.

Tests were made with arcs of contact of 125°, 135°, 153° and 180°.

Without treatment the average coefficient of friction is $\mu = 0.127$. With treatment the average value is $\mu = 0.163$.

The tests were static in nature. Power was not transmitted at the time of the test.

Examination Questions

Suggested Questions Relating to Breathing Apparatus

Ques.—What is the object of the breathing apparatus?

Ans.—It is designed to supply the wearer with a perfectly respirable air entirely independent of any communication with the outer atmosphere, for a period of two hours, thus enabling the wearer to penetrate (using due precaution) an atmosphere that is dangerous to life and will not support combustion, such as results from explosions or fires in mines.

Ques.—Name the principal features of the apparatus.

Ans.—1. The method of supplying the wearer with sufficient oxygen from a steel cylinder containing 10 cu.ft. of pure oxygen at a pressure of 120 atmospheres, or nearly 2000 lb. per sq.in., through a reducing valve, which reduces the pressure to normal breathing pressure and regulates the supply of oxygen to 2 liters or 122 cu.in. per min., which is the quantity necessary when performing strenuous work.

2. The method of absorbing the impurities, carbon dioxide and moisture, given off or exhaled from the lungs, is by the use of caustic potash or caustic soda, which takes up the carbon dioxide and moisture. The nitrogen of the air, being set free, circulates with the oxygen supplied from the cylinder at 2 liters per minute and thus furnishes the volume of fresh air that is necessary for free breathing.

Ques.—How would you prove that the apparatus is in a safe working condition?

Ans.—First, I would observe the gage or meter to see that the proper supply of oxygen was contained in the oxygen cylinder and fix the cylinder in the proper place on the apparatus, and prove by water gage or meter that 2 liters per min. of oxygen are being delivered.

Second, if the Draeger or Westfalia apparatus is used, I would remove the seals from the connections of potash cartridges and shake each cartridge to see that it is loose and rattling freely, when I would consider it in good working condition. This is the only test left for regenerator to the wearer, and is uncertain. If Proto or Fleuss apparatus is used I would examine the breathing bag to see that it is clean and that the inhalation and exhalation passages are free from obstruction and clean and the breathing tubes air-tight; also, that the proper amount of caustic soda (4 lb.) is placed properly in the bag, two pounds on each side. Then adjust all attachments together firmly, making the joints secure and air-tight. Now, apply the oxygen supply tube to the meter or water gage to determine that the proper supply of oxygen, 2 liters per min., is being delivered to the wearer. Being satisfied, put on the apparatus, inflate the breathing bag from the outside atmosphere, turn on the oxygen supply and go into a smoke-laden chamber for a short period of time and again determine that there are no leaks and that breathing is normal before entering a mine.

Ques.—What quantity of air must the apparatus be capable of supplying per minute?

Ans.—This is an indeterminate quantity, as the amount of air necessary depends on the amount of work being done, which is a vital point that the student should thoroughly understand. Haldane, in his tests, says, "In heavier work, such as ascending an incline or running, the oxygen consumed may amount to 3 liters per min. (183 cu.in.) while the volume of air breathed runs up to over 100 liters per min. (6102 cu.in.)." For ordinary work, 50 liters, or 3051 cu.in., of pure air per minute will suffice, while wearing a rescue apparatus. It is important, therefore, to see that the pipes, valves, etc., are of such a size that this amount of air can be comfortably obtained. Any undue resistance to the breathing would cause great distress and might be a source of danger.

Ques.—What quantity of oxygen must the apparatus supply per minute?

Ans.—The amount of oxygen arranged for by the makers of the apparatus is a constant supply from a steel cylinder of 2 liters, or 122 cu.in. per min. This should be regarded as a minimum when a man is walking about or performing moderately hard work. The store of oxygen carried should also be sufficient to maintain this supply for two hours, or for whatever period the apparatus is meant to be used.

Ques.—What quantity of carbon dioxide does a man produce during heavy work in two hours?

Ans.—That depends on the physical energy exerted, or the amount of work done. The Draeger apparatus must be capable of completely eliminating the 94 liters (3⅓ cu.ft.) of carbon dioxide exhaled by a man doing work, during a period of two hours. After some severe tests with the Proto or Fleuss, it was shown that with an oxygen consumption of 2 liters per minute, about 220 liters, or nearly 1 lb., of carbon dioxide would be produced in two hours. This would convert nearly 1 lb. of pure caustic soda into bicarbonate or 2 lb. into carbonate. The tests indicate that 5 lb. of caustic soda would be a safe amount for work underground. The extra quantity is useful in diminishing heating. Since 1 cu.ft. of air (60 deg. F., 30 in. barom.) weighs 0.0766 lb. and the specific gravity of carbon dioxide is 1.529, the space occupied by 1 lb. of this gas at normal temperature and pressure is

$$\frac{1}{0.0766 \times 1.529} = 8\tfrac{1}{2} \textit{ cu.ft.}$$

Ques.—What would you do if you found a feeling of suffocation coming on during work, while wearing the apparatus?

Ans.—I would stop work, inform those with me of my condition, use the bypass if there is one, and if doubtful as to the cause I would then retire to fresh air as quickly as my condition would allow. The cause may be insufficient supply of oxygen due to obstruction in valves or tubes; potash or caustic soda unable to absorb the carbon dioxide exhaled, due to a poor quality; defective breathing bag, or a leaky joint. Collapse may take place before I would be able to retire, and it may be due to overexertion; in which case rest and do less work.

Coal and Coke News

Harrisburg, Penn.

Chairman W. B. Ainey, of the Public Service Commission, has directed the Philadelphia & Reading Ry. Co. to install, within 30 days (from Aug. 17), passenger train service upon the Middle Creek branch, between Swatara Junction and Newton.

The railroad company claimed that the branch was constructed as a mine lateral, and not for the purpose of carrying passengers and that, therefore, the commission was without authority to make any order. Further objections were: Lack of necessity for its service; that the expense thereof would be too great, and that the passenger train would be run at a loss.

Chairman Ainey overruled all of these objections and held that, though the branch might have been built for the purpose of carrying coal, the Act of Assembly creating the branch railroad placed no such limitations upon it and that, therefore, it lawfully might carry passengers.

The decision is regarded as of much importance for the further point decided—which was that it is not an answer to a demand for passenger service to show that the particular train would be operated at a loss. "The first duty of a railroad," the Commission said, "is to perform its proper corporate functions, and, if carrying passengers is one of them, it must perform such duty or give up its charter privileges."

The expense of operating a particular train, involving a loss, may be of more or less importance in determining rates to be charged, but of itself will not justify a railroad in refusing to give to any community reached by its lines such service as may be needed and reasonably demanded by the public.

Can the Surface be Protected?

It will soon be determined whether there are resources in the law for the protection of public property from cave-in damages that are not available for the protection of private property, or whether the law has means of general protection that have not yet been revealed.

The case to be determined comes from the Scranton district. The state armory at that place is endangered by mining. The state armory board has made an investigation and has found that conditions were as represented, due to mining of the coal under the building.

Renewed effort is being made to find some means whereby a remedy may be secured from the cave-in menace. It has been held by some lawyers that public property is in a different class than private property, that notwithstanding deed stipulations, that the surface can be damaged, because the people who purchased the surface built upon it with the stipulation that the owner of the mineral rights be absolved from all liability, coal companies are obliged to protect school houses, streets, etc., the pipes supplying public utilities, and so on. It has also been held that the police powers of the state not yet thoroughly applied in test cases are ample to safeguard the people.

The case submitted to the Attorney General by the state armory board will be awaited with much interest.

Some Reports have been Filed

Considerable interest is being shown in the filing of the first reports of anthracite coal production under the new act (1915). August 20 was the day set for the filing of reports of the July output and a number of the largest anthracite producers did not file. Some leeway will be given by the Auditor General on the filing.

Some objections to the filing by the 20th have been made, because of the contention that the prices are not known much before that time. The contention has also been advanced that dredging is not washing coal and that coal dredged is not taxable, but the state officials take the other view.

It is probable that some stipulations regarding the coal tax assessment will be filed before many weeks.

PENNSYLVANIA

Anthracite

Nesquehoning—The payment of wages to the employees of the Lehigh Coal & Navigation Co. last week was the biggest for a long period, as the miners had been making full time.

Lansford—The employees of the Lehigh Coal & Navigation Co., in the collieries in the Panther Creek Valley are disinclined to accept the provisions of the workmen's compensation act which becomes effective with the first of the year. They claim that the new act is not nearly as favorable as the present code under which they are working.

Jeddo—In the villages of Jeddo, Oakdale, Highland and Harleigh, where collieries are operated, the G. B. Markle Co. is erecting transmission lines to supply electric current for the inhabitants.

Port Clinton—Coal shipments via the Schuylkill Canal, which have been growing less each summer, have now practically ceased. Heavy rains throughout the anthracite region have almost closed the channel with culm and it will take several weeks to restore the canal to navigable condition. It is reported in some quarters that it is the intention to abandon the canal entirely.

Hazleton—The collieries at Black Ridge, which have been operated for over 15 years by the Hazle Mountain Coal Co., have been abandoned, as the company no longer found it profitable to operate them, the veins having been worked out.

Scranton—Officials of the Delaware, Lackawanna & Western Coal Co. recently announced that workmen were still working day and night in an effort to discover the fire which is supposed to be burning in the old workings of the Bellevue mine under Luzerne Street in West Scranton. It is the intention to discover the cause of the hot waves which have been penetrating the other workings of the mine during the past two weeks. Search for the fire is hampered by the many subsidences encountered. It is possible that the fire if it exists, has burned itself partly out, but the intention is to continue the search until the cause of the heat is discovered.

The Hyde Park colliery of the Delaware, Lackawanna & Western Coal Co., will close down for a period of about 10 days while repairs are being made. The Taylor mine will also close down for the same length of time and for the same purpose. The other collieries of the company are working full time, and it is anticipated that this condition of affairs will exist for a considerable time to come.

Coaldale—The Lehigh Coal & Navigation Co. is preparing to remove the water from its No. 9 mine. This mine was flushed last December to extinguish a fire. When cleared of water it will furnish employment for about 100 men.

Bituminous

Johnstown—Highwaymen were foiled recently in their attempt to steal the $10,000 pay-roll of the Greenwich Coal Co. Ordinarily the money was sent by express from here, but owing to the train being late the paymaster, Frederick Vinton, took the money in an automobile. On the same road over which Vinton passed in safety, a short time later the highwaymen attacked the driver of the express wagon and, of course, failed to get the money. The bandits, three in number, were afterward rounded up by two state policemen, one of whom, Daniel Duckler, was badly wounded by being fired upon by one of the men.

Jennerstown—The Berwind-White Coal Mining Co. is beginning to produce coal to be shipped to Italy as a part of the big 300,000-ton order recently awarded to the concern. The Consolidated Coal Co. is also mining for an Italian order.

Connellsville—Complete returns of the 1915 garden competition among the employees of the H. C. Frick Coke Co. were made public on Aug. 20, by the committee of judges. They reported that 6819 heads of families employed at the company's 56 plants, had taken advantage of the offer to cultivate company property, raising vegetables to the value of $186,585. Only 270 of the plots available were not used, and the judges expressed the belief that some of this ground was so sterile as to make its cultivation unprofitable. The coke company buys these vegetables at the current market price.

Shipments of coke from the Connellsville region recently amounted to 378,000 tons per week, the shipments exceeding production. Merchant coke production has risen to nearly 150,000 tons weekly. This is a greater output than at any time since the first half of 1913.

Greensburg—Coal operators in the Greensburg region are reported to have taken all the orders for coal that they can fill between now and Christmas. It is said that every available miner in the district will be given work and all mines will work six days a week. Some mines closed down for years will be opened.

Uniontown—Options on 1300 acres of coal, including the greater part of the unsold coal land in Luzerne Township, Fayette County, have been closed by Pittsburgh interests for $2,500,000. The option will expire on Sept. 10. The coal optioned is surrounded by some of the largest coal and coke interests. On the north are the holdings of the W. J. Rainey Co., on the northeast is the acreage of the Republic Iron & Steel Co., on the east is the land of the Tower Hill Coal & Coke Co., on the south are the holdings of J. V. Thompson, and on the west are the H. C. Frick operations. The coal, according to analysis, contains less than 1 per cent. of sulphur and is considered the best coking coal in the entire region. The options are on the following properties: Miss Adelaide Van Kirk, 65 acres; Mr. and Mrs. G. L. Hibbs, 115 acres; Misses Fannie and Laura Swan, 125 acres; W. J. Stewart heirs, 325 acres; Newall A. Porter, 140 acres; Columbus Porter, 187 acres; Mrs. James Chalfant, 160 acres; James West, 90 acres; Mrs. Sharpnack, 100 acres.

Pittsburgh—More than a dozen coal mines in the Monongahela River-Pittsburgh district have been speeded up during the past week. Coal production is now said to be at a higher rate than at any time this year. The shipments to Lake ports have increased, the steel trade as a whole is taking tonnage fully equal to the busiest season of 1913 and other industries not affected by the European war, have enlarged their consumption so that the demand is rapidly approaching a point where the mines will have difficulty in meeting it promptly. Exports of coal from the district, while rare because of the long rail haul to the seaboard, have actually taken place the last few days. While operators say the export trade will never directly affect this territory it will benefit it by broadening the home market as the demand from abroad will keep eastern mines too busy to supply the domestic markets adequately. According to estimates recently made, 7500 men have been added to the working forces of the coal mines in the district in two weeks, all on full time.

WEST VIRGINIA

Charleston—The following delegates have been appointed by Governor Hatfield to represent West Virginia at the American Mining Congress, to be held in San Francisco, Sept. 20-23: Edward Schoenebaum, George T. Watson, W. H. Koch, A. J. King, Edward O'Toole, E. E. White, Clyde Hutchinson, James Elwood Jones, George S. Patterson and R. P. Maloney.

J. H. Nightingale, commissioner of weights and measures, recently directed that all coal companies operating in West Virginia, pay the miners for the actual coal loaded. Heretofore a limit of 5000 lb. has been fixed as a carload, and all over that amount has been credited to the coal operators. On the other hand, it has been the custom to dock the miners for any shortage found on the cars.

Examinations for certificates as mine foremen and fire bosses will be held throughout the State of West Virginia at the following places and dates: Welch, Sept. 21-22; Logan, Sept. 28-29; Grafton, Oct. 5-6; Mt. Hope, Oct. 12-13; Charleston, Oct. 19-20.

Carlisle—Paul Nowack and John Balko, miners in the employ of the New River company, were discovered some time ago smoking their pipes in the company's mine at Carlisle. They were tried by a justice and fined $20 and costs each. Since Feb. 6 last, the mines have been worked with safety lamps exclusively. On February 6 an explosion occurred killing 21 men. The flagrancy and persistence with which some miners take all kinds of risks in spite of the warnings and rules of the Mine Inspection Department is the cause of much chagrin and disgust to some of the department officials.

Fairmont—The action of the Baltimore & Ohio R.R. Co., in going into the market for additional coal carrying cars and locomotives, has been favorably commented upon by the operators in this section. It is stated that there is now beginning to develop a shortage of cars in the Fairmont district, where all the mines are in full operation, despite the labor shortage which for a time affected some of the operations. It is thought possible that a shortage of cars is not far distant. While railroad officials state that there are still plenty of cars, the surplus stock is rapidly disappearing; consequently large orders have been placed for immediate delivery.

Clarksburg — The Madeira-Hill-Clarke Coal Co. has received sufficiently large orders for export coal to keep the three mines of the company working at full capacity for several months. These mines have been working part time for a considerable period.

Huntington—The Huntington mine rescue car will make a 10 months tour over West Virginia. The object of the tour is to train mine rescue and first aid crews, and to carry the propaganda of safety to the mines. The trip will cover the Chesapeake & Ohio and Kanawha & Michigan lines, and the itinerary of the car will be ready for publication in a few days.

VIRGINIA

Norton—The coke ovens of the Colonial Coal & Coke Co. at Dorchester, and those of the Stone Gap Colliery Co. at Glamorgan are now all in full operation six days per week, while all mines are operating full time, turning out their full capacity.

ALABAMA

Montgomery—The lower house of the Legislature recently passed by a vote of 66 and 31 a bill which, if eventually enacted, would prevent the state after Jan. 1, 1918, from leasing any convict serving a sentence of five years or less to any corporation, and would further after Jan. 1, 1920, prevent the leasing of any convict under any sentence whatsoever. There has been much agitation over the leasing of convicts to coal mining companies, and it is estimated that the result if the action of the House is sustained by the Senate, will be to remove the convicts from the mines and put them to work in farming and road-building in various sections of the state.

KENTUCKY

Logmont—Extensive improvements have been made in the plant, mine equipment and camps of the Luke & Drummond Coal Co., which were taken over some time ago by the Crystal Coal Co. Thirty new houses are being built for miners and all the existing houses have been put in good condition. Fifty new cars have been put into service thereby giving the loader a full turn and more cars will be added. A new fan house has been constructed and all the air-ways and brattices put in order. The incline to No. 3 mine has been double tracked, boilers overhauled and the railroad track extended so as to hold about 25 cars. The commissary will be enlarged and the stock extended. The company has advertised for coal loaders and is pointing to separate schools, a well-ordered camp, payment on the run-of-mine basis, etc., as inducements to labor. The Poplar Lick vein has been opened and will be developed in the near future, it is stated, the vein running from 4 to 6 ft. in thickness. The old Sagamore Coal Co., formerly operated this vein. The Crystal company is under the same management as the Climax Coal Co. at Edgewood. Hiram Silvers is superintendent and Frank Clutts mine foreman.

OHIO

Columbus—The New Method Coal Co. of Columbus, which is developing a stripping proposition in Jefferson County, Ohio, is progressing satisfactorily in the development work. Two large steam shovels have arrived and are being installed. It is hoped to start loading coal by Oct. 10 at the latest.

Millfield—Fire, caused by a gas explosion was discovered in Mine No. 6 of the Poston Consolidated Coal Co. early Aug. 21, and all efforts of the local officials to extinguish it failed. As a result the Ohio Mine Department was notified and J. M. Roan, Ohio Mine Inspector, left on the mine rescue car at noon, Aug. 21, to take charge of the situation.

Bridgeport—Seven thousand dollars were distributed among 3500 miners of this section recently, giving $2 each on what is known as the "unemployment fund" of the miners' organization. Since the scale was signed work at the mines has not been plentiful. The 3500 men have been idle ever since the strike was declared.

Cambridge—The work of pumping out the Kings mine of the Akron Coal Co. has been started and it is planned to resume operations. The mine has been idle for several years and it was filled with water. The mine formerly gave employment to 200 miners.

INDIANA

Boonville—The Big Four Coal Co. is installing electrical and new shaft equipment, to cost $75,000. The coal will be hauled by motors two to three miles underground.

ILLINOIS

Belleville—The shaft of the Summit coal mine, owned by the Summit Coal Co., on the Louisville & Nashville R.R., near here, caved in recently, causing a loss of between $1000 and

$2000. The foundation of the tipple sank 30 ft., the tipple collapsed and the shaker house was thrown out of plumb. The shaft had just been retimbered, the work requiring three weeks. The cave-in was caused by the removal of dirt around the timbers and the heavy rains. The shaft may have to be rebuilt entirely. Nobody was hurt, but it will be several weeks before work can be resumed at the mine.

Millstadt—A contract is about to be closed for the removal of 100,000 carloads of earth from the Northern Coal Co.'s Fischer strip-mine near here and used in the construction of part of the East St. Louis levee. Since the Northern Coal Co. began operating the strip-mine the dirt removed from the top of the coal vein has accumulated until it is a miniature mountain. Three steam shovels are to be used in loading it and six extra trains on the Mobile & Ohio R.R. will carry it to the levee. When the accumulated dirt is removed the steam shovels will uncover a further area of coal and load the cars at a single operation.

IOWA

Des Moines—The Maple Block Coal Co. has opened a new mine at the outskirts of the city. The shaft is 140 ft. deep and 200 men are employed. The daily output will be about 700 tons. The vein is from 3½ to 4½ ft. thick. John Schuler is president of the company.

OKLAHOMA

McAlester—About 150 coal miners at Savanna have been reemployed, and the output of the McAlester coalfield increased approximately 400 tons per day by reason of an agreement concluded between the Savanna mine and the Savanna Mining Co. The latter firm takes over the operation of the Savanna property which formerly belonged to the Dow Coal Co. which went into bankruptcy last February.

WASHINGTON

Spokane—Anthracite coal, of good quality, and in quantities to make it of interest to the commerce of the Pacific Northwest, has been found on patented claims in Whatcom County, owned by Alexander Polson, of Hoquiam. Mining engineers have made an investigation for Mr. Polson, and it is reported that 3,000,000 tons are already blocked out by these experts. Furthermore, it is stated that this 3,000,000 tons is but a small fraction of the total deposit.

FOREIGN NEWS

London, England—It is reported unofficially that the main demands of the Welch coal miners for higher wages has been granted by Walter Runciman, president of the Board of Trade, with whom representatives of the mine workers have been conferring.

PERSONALS

J. O. Hobby was appointed treasurer of the American Locomotive Co. at a recent meeting of the directors of that firm.

E. C. Lee has been made an inspector of coal mines for the associated insurance companies with main office in Pittsburgh, Penn.

J. J. Strickler, of Lansford, Penn., employed by the Lehigh Coal & Navigation Co. as a foreman, has announced himself as a candidate for the office of mine inspector of Carbon County.

Juan Garcia, 51 years of age, is the oldest employee in point of service on the payroll of the Colorado Fuel & Iron Co., in Colorado. Garcia works at Rouse and has been employed continuously at that camp since 1885.

H. C. Campbell, for 10 years in charge of the mines of the Central Coal & Coke Co., of Kansas City, Mo., has resigned. Mr. Campbell was recently elected president of the Campbell Glass & Paint Co., the interests of which firm demanded his entire time.

James M. Page, of Strong, Colo., superintendent of the Sunnyside Coal Mining Co., recently made an inspection trip through the Routt County coalfields, paying particular attention to equipment and methods of preparation of coal throughout that section.

H. H. Henderson has been placed in charge of the Pittsburgh office just opened by the Goulds Manufacturing Co. in the Oliver Building of that city. Mr. Henderson has been representing the company in northern West Virginia and southeastern Ohio. E. C. Wayne has been appointed assistant manager.

W. J. Hamilton has retired from the William J. Hamilton Co., a concern which he established several years ago, and which is located in the Schultz Building, Columbus, Ohio. He will continue in the coal jobbing business and is organizing the W. J. Hamilton Coal & Coke Co., and will have offices in the Columbia Building.

R. E. Hall, former manager of the Boston office of the Goulds Manufacturing Co., and W. E. Dickey, formerly of the New York office, and both vice-presidents of the company, have taken charge of the sales organization of the firm. Mr. Hall is now located at Seneca Falls, the home office of the firm, while Mr. Dickey has charge of all business in southern Southwestern and Southern Pacific states.

George M. Carpenter, formerly fuel inspector for the Nashville, Chattanooga & St. Louis Ry., now connected with the Clinchfield Fuel Co., of Spartanburg, S. C., will make the trip as representative of his company with the 5000 tons of coal which is to go as the first shipment on the contract his company has with the Buenos Aires & Pacific Ry. While in South America he will investigate conditions in an effort to find a market for American coal.

OBITUARY

John L. Phillips, aged 47, for several years mechanical engineer for the Mount Morgan Coal Co., was found dead in bed at Williamsburg, Ky., recently. He had been a sufferer from heart disease. His mother and sister survive.

John C. M. Day, widely known as a coal, timber and railroad man of eastern Kentucky, died recently at his home in Winchester, Ky., following a long illness of Bright's disease. For several years, until his health failed, Mr. Day was president of the Mountain Central R.R. and was also interested in numerous coal and timber projects in the eastern Kentucky field. Mr. Day was born in Breathhitt County in 1859. He is survived by his wife and four children.

RECENT COAL AND COKE PATENTS

Grate Bar. E. C. Clark, Nutley, N. J. 1,145,349, July 6, 1915. Filed Oct. 10, 1912. Serial No. 724,907.

Grate Bar. C. W. Hopes, Glen Falls, N. Y., 1,140,158, May 18, 1915. Filed July 21, 1914. Serial No. 852,176.

Coal Cleaner. J. R. Montgomery, Frankfort, Kan., 1,140,999, May 25, 1915. Filed May 25, 1914. Serial No. 840,807.

Fuel Feeding Apparatus. G. L. Swift, Chicago, Ill. 1,140,207, May 25, 1915. Filed June 16, 1910. Serial No. 567,149.

Furnace Fire Grate. J. Carew, Liverpool, Eng. 1,147,605, July 20, 1915. Filed June 12, 1913. Serial No. 773,306.

Coal Jigging Plant. Christian Simon, Essen-Ruhr, Germany, 1,144,735, June 29, 1915. Filed Apr. 17, 1914. Serial No. 832,627.

Gas Producing Furnace. F. C. Hamilton, Kansas City, Mo. 1,145,892, July 13, 1915. Filed Apr. 26, 1913. Serial No. 763,734.

Steam Boiler Furnace. I. C. Dakin, West Newton, Penn. 1,147,216, July 20, 1915. Filed Apr. 7, 1914. Serial No. 830,197.

Tunneling Machine. W. W. Giggey, Netherland, Colorado, 1,140,673, May 25, 1915. Filed Mar. 13, 1912. Serial No. 683,520.

Combustion of Fuel. P. O. Perkins, Salt Lake City, Utah. 1,146,732, July 13, 1915. Filed May 6, 1915. Serial No. 26,222.

Mining Machine. J. E. Flexner and E. O'Toole, Gary, W. Va., 1,143,897, June 22, 1915. Filed July 8, 1912. Serial No. 708,122.

Electric Motor Driven Coal Cutter. R. Martin, Irvington, N. J. 1,145,331, July 6, 1915. Filed Jan. 27, 1912. Serial No. 673,927.

Smoke Consumer. G. O'Neill, Moncton, New Brunswick, Canada. 1,145,504, July 6, 1915. Filed Jan. 18, 1915. Serial No. 2870.

Process for Burning Powdered Fuel. H. L. Doherty, New York, N. Y. 1,145,356, July 6, 1915. Filed Dec. 31, 1909. Serial No. 535,844.

Device for Detecting Incomplete Combustion. A. E. Carr, Liverpool, Eng. 1,143,889, June 22, 1915. Filed Mar. 13, 1913 Serial No. 753,928.

Coke Oven. F. Peiter, assignor to Gas Machinery Co., Cleveland, Ohio. 1,146,442, July 13, 1915. Filed Feb. 24, 1913. Serial No. 750,228.

Electrically Operated Mine Door. W. W. Murray and J. F. Dillon, Dearing, W. Va. 1,145,787, July 6, 1915. Filed July 31, 1914. Serial No. 854,294.

Process for Converting Fine Coal Into a Marketable Fuel. J. Evans, Melbourne, Australia, 1,140,735, May 25, 1915. Filed Aug. 14, 1913. Serial No. 784,718.

Method of Operating Gas Producers. H. Koppers, assignor to H. Koppers Co., Chicago, Ill. 1,146,627, July 13, 1915. Filed July 27, 1914. Serial No. 853,349.

Bit Holder for Mining Machines. N. D. Levin, assignor to Jeffrey Mfg. Co., Columbus, Ohio, 1,140,173, May 18, 1915. Filed Jan. 8, 1909. Serial No. 471,298.

Apparatus for Manufacturing Coal Gas. H. Bruce, assignor to Bartlett-Hayward Co., Baltimore, Md. 1,144,977, June 29, 1915. Filed Jan. 7, 1914. Serial No. 810,723.

Boiler Flue Cleaner System. F. W. Linaker, assignor to Vulcan Soot Cleaner Co., Pittsburgh, Penn. 1,144,553, June 29, 1915. Filed Mar. 8, 1915. Serial No. 12,793 .

INDUSTRIAL NEWS

Pittsburgh, Penn.—The Pennsylvania coal dock at Wanatah, Ind., has been placed in service, although the work of construction is still in progress and it will be some time before the dock will be completed.

Fairmont, W. Va.—The Consolidation Coal Co. recently closed a contract with the Egyptian Rys. for the delivery of 60,000 tons of coal in the near future. This company is now preparing to load approximately 140,000 tons of fuel on vessels either in port or expected to dock shortly.

Bluefield, W. Va. — Two electric locomotives recently brought a train of 70 cars containing something over 5000 tons of coal, to this city. This is believed to be the largest train ever brought in by electric locomotives. The previous record for number of cars was 68. Trains containing 65 cars are a common occurrence.

Cleveland, Ohio—It is stated that every railroad entering Cleveland is now storing coal in large quantities or making preparations to store it, in anticipation of a possible coal shortage this winter and the coming spring. This action follows that of the Pennsylvania Lines which have been storing considerable quantities of coal in Pennsylvania.

Pittsburgh, Penn.—The Distribution Branch of the United States Immigration Service recently received a call from the Quemahoning Coal Co., Somerset County, Penn., for 200 coal miners. The New River Association, which operates mines in Fayette County, W. Va., also asked for 300 men. This is regarded as an indication of the improvement in industrial conditions in the above-named districts.

Washington, D. C.—The Interstate Commerce Commission has allowed the increase of 25c. per gross ton in anthracite coal rates from Pennsylvania to Chicago, and other Illinois points covered by the Chicago rates; also to St. Louis and points in the same district. The tonnage affected is about 2,500,000 tons annually, and the principal railroads to benefit are the Erie, Lackawanna and Lehigh Valley.

Steubenville, Ohio—The directors of the LaBelle Iron & Steel Co. have awarded to the H. Koppers Co., of Youngstown, Ohio, a contract for the construction of a byproduct coking plant of 96 ovens, which will cost about $2,000,000. The plant will be constructed on the West Virginia side of the Ohio River, opposite the company's plant on the Ohio side, and will be connected with the present plant by a bridge.

Hazard, Ky.—The Buffalo Creek Branch of the Lexington & Eastern R.R. from Lothair 5 miles up Buffalo Creek, and the First Creek Branch into new coal fields surrounding Hazard are nearing completion. Both will open extensive new coal fields where a number of operating companies are at work getting into readiness to begin shipping coal. It is expected that both branches will be completed within 30 days.

Des Moines, Iowa—Three suits have been started in the Polk County district courts to test the validity of the new workmen's compensation law. The latest is Charles Severline against the Economy Coal Co., in which the plaintiff claims $625 for injuries. The plaintiff was not under the compensation act at the time of the accident. The law removes "common law" defenses such as contributory negligence, assumption of risk and fellow-servant rule, whenever an employer fails to come under its provisions. In the cases now on the docket the coal companies will attempt to have this part of the statute declared invalid.

New Orleans, La.—Coal will shortly be brought from the Pennsylvania, West Virginia, Alabama, and other fields, in barges and boats to New Orleans. It is estimated that the increase in rates on coal granted the railroads from these fields will mean $150,000 a year added expenditure for consumers here. A company is in formation to transport the coal in barges to this port, by way of the Mississippi, Ohio and other rivers.

Columbus, Ohio—The supreme court of Ohio will be asked to enjoin the examination of the books of the Hocking Valley R.R. by the Sunday Creek Coal Co. experts, who were appointed as special employees of the state by the Utilities Commission. A motion has been filed that the Commission vacate its order directing these experts to make the examination. The objection made is that the experts appointed to act for the state are not disinterested.

Cincinnati, Ohio—It is reported that during the recent past, the Pennsylvania R.R. has put into commission every available engine and car along its lines. This has been due to the heavy orders for coal transportation from the mines to the eastern seaboard. It is said that within the recent past more than 1,400,000 tons of coal has been contracted for by coal mining companies in western Pennsylvania for France, Italy, Spain, Portugal and Egypt.

Washington, D. C.—The coal-carrying railroads which are affected by the decision of the Interstate Commerce Commission reducing the freight rates for the transportation of anthracite, are expected to decide shortly as to the course of action to be pursued with the view of contesting the findings of the commission. It has been estimated that the nine coal-carrying roads will lose approximately $8,000,000 per year in earnings under the new rates which become effective Oct. 1 next.

Chicago, Ill.—The Illinois properties of the Dering Coal Co. at Westville and West Frankfort, have been sold under foreclosure to the Producers Coal Co., of which F. S. Peabody is president. The transfer of these properties has already been made. No disposition has yet been made of the Indiana holdings of the Dering Coal Co. Mr. Peabody will have entire charge of the management of the new company, and is negotiating with J. K. Dering of the J. K. Dering Coal Co., to continue handling the product of these mines.

Pottsville, Penn.—A section of one of the first, if not the first, railroads in the United States was unearthed on Aug 21, by Foreman Nelson Clayton, of the Pottsville Water Co., who had a gang of men excavating in Coal St. It is a narrow-gage railroad, and was originally used to bring coal to the Schuylkill Canal, when that waterway ran into the heart of Pottsville. Now the old canal is filled with coal dirt and culm for a distance of 25 miles from here. It is said the railroad was laid prior to 1830. The rails and sills are in an excellent state of preservation.

Philadelphia, Penn.—It is reported that shipping men and freight brokers of Philadelphia have received inquiries for shipment of cargoes of coal to Liverpool, England. For some time past, England has been unable to supply coal to her allies, and the price of coal abroad has risen in some instances to as high as $27 a ton. Inquiries from England itself are a surprise here although it has been known for some time that the output of English mines has been decreased decidedly on account of the enlistment of miners and because of labor troubles.

Baltimore, Md.—Suit has been entered in the U. S. district court at Baltimore by the Consolidation Coal Co., in which it seeks to recover $105,000 damages from the Munson Steamship line, a New York corporation, for alleged breach of contract to transport 12 cargoes of coal from Baltimore to ports in Italy. The European war and the attendant dangers to trans-Atlantic vessels, occasioning a shortage in the number of available freighters, is believed to have caused the alleged breach. Since Apr. 1, it is asserted, the defendants have failed to comply with their agreement to transport one cargo monthly.

Shoshoni, Wyo.—It was reported here recently that H. O. Barber, general manager for the Poposia Coal Co. at Hudson, has offered to build a grade from Shoshoni to the Shot Gun coal fields, providing the Northwestern R.R. would lay the steel for a railroad to that point. The Shot Gun fields lie about 43 miles west from this point and are said to contain the best coal in the state. In this field there are five or six out-croppings, which show for a distance of about three miles. These veins run from 4 to 26 ft. in thickness and the indications are that these veins eventually combine in one large vein.

Coal Trade Reviews

General Review

Full winter schedule on anthracite now at hand and business will slow down pending cooler weather. Indications of a stiffening in bituminous. Foreign inquiries from Great Britain. Retail buying gaining momentum at interior points.

Anthracite—Buying showed the customary month-end spurt, and it is noted that more inquiries are appearing as the season advances. The movement continues slow, however, and with the full winter's schedule now in effect, it will require some evidence of winter weather to inject any activity into the market. The domestic grades are in plentiful supply and are inclined to heaviness but the steam sizes are fairly strong although any demand for these is easily met. The unusually attractive terms offered retailers, as regards credit and prices during the summer, has resulted in heavier stocking than is usually the case. The strong position of the independent operators, as indicated by the increased price cutting is causing no little concern.

Eastern Bituminous—The large export trade and rigid curtailment in mining operations are tending to keep supplies down to a healthy basis with the result that prices are fairly well maintained in spite of the fact that the maximum dullness of the season is apparently at hand. The request for bids from a large Eastern railway system and from the Panama Canal R.R. are two important inquiries now pending. Some observers see a slight but well defined stiffening in the demand for coal which is being reflected in the firmer attitude operators are taking as regards prices for future delivery. There is hardly any doubt that industrial conditions are picking up slightly but operators are still actively canvassing for business, and minimum prices are the rule.

Export Trade—Many of the foreign inquiries on which negotiations have been in progress for some time, have been closed. In addition to this bunkering trade is showing a substantial increase, vessels now usually taking all the possible tonnage at this end because of the uncertainty as to obtaining supplies abroad. A feature of interest in export circles during the week was the receipt of several inquiries for shipment to England. The heavy movement to Italian ports still continues and some large cargoes have gone to South American points also. Vessel rates in the off-shore trade are slightly stronger, particularly to Italy, and with grain shipments soon to be competing for tonnage, the indications point to a still further advance.

Lake Markets—The situation in the Pittsburgh district is distinctly better. The railroads are taking slightly larger tonnages and the effect of the long continued improvement in the steel industry is at last beginning to be noticed. The demand is chiefly against contracts. The heavy rains in Ohio have had an adverse effect on the market although the general tone is slightly better. Retail buying continues light in spite of the advancing season and it is thought that this will cause an unusual rush for coal later to make up the deficiency. A great many companies are still obtaining their current requirements in the spot market but a moderate tightening of the situation will force them to contract. There is no improvement in the Lake movement which is proving a decided disappointment. In the Southern market the cotton mills are reported to be doing considerable buying which has stimulated some activity in that direction.

Middle West—Retail buying is gradually obtaining momentum as the season advances, and there is perhaps a slight improvement in the steam market, though not of important proportions. It is not believed that much further improvement can occur until some cool weather forces consumers into the market. The outlook in the Lake trade continues as discouraging as ever, but some favorable signs are noted in general industrial conditions. The enormous crops are having a decidedly beneficial effect on sentiment and some of the larger railroad systems are reported to be stocking up against a possible stringency in the market this fall.

A Year Ago—Heavy rail shipments in anthracite and business is moderately active already. Eastern bituminous situation still improving. Orders on shipments for foreign markets are being reported. Trade slowing expanding and will be active shortly. Lake shipping better.

BUSINESS OPINIONS

Boston News Bureau—It is certainly a most remarkable situation. The quickness with which the security market came back on request of the German ambassador that this country withhold action on the "Arabic" case until the German government has forwarded an explanation shows the sensitiveness of the situation. But the fact is that we as a people are growing immensely rich as a result of the foreign war. General trade, to be sure, is still chiefly confined to war orders, but the buying power is increasing enormously. Gradually the idea is permeating the country that the prosperity that is coming to us cannot be downed. There is more confidence appearing, therefore, in every quarter. With the harvests of the immense crops, now practically assured, our wealth will be prodigious, and this must find vent in new business enterprises and must naturally increase the investment ability.

Iron Age—That the Steel Corporation would buy pig iron has been persistently reported, but it is stated on the highest authority that it will not. It has seven Northern furnaces of modern calibre that can yet be put in, and the furnaces now active, 90% of the total capacity, are making larger outputs than ever. A Pittsburgh steel company has just bought 25,000 tons of basic iron for this year. Rails cannot now be had for early delivery. In the past week 30,000 tons were placed, of which 15,000 tons, which goes to Alabama, cannot be delivered before October. At Chicago a Western road has bought 11,000 tons of tie plates, and the price there has advanced from $27 to $28.

American Wood and Cotton Reporter—Scoured wools have been a feature of the wool market for the last week, including especially Australians. The large foreign orders have created a demand for these wools. Territory wools have been sold in large quantities, particularly Montana wools. The market is still very strong. In the woolen and worsted goods market the situation is very interesting, with the outlook continually becoming brighter for woolen goods producers.

Raleigh Coal & Coke Co.—Speaking strictly for ourselves, we consider that we are warranted in buying and stocking larger quantities and wider variety of materials than heretofore. More than 50% of our business associates are optimists.

Dun—International monetary complications and disturbances in the ranks of labor constitute the chief elements of uncertainty in the general situation. There is, however, nothing either unsound or disquieting in strictly domestic finance, and though further controversies between employers and wage earners have arisen, serious and protracted troubles have thus far been averted.

Bradstreet—Trade continues to broaden, industry to quicken and optimism to spread, without, however, diminishing conservatism or allowing sight to be lost of the unsettled aspect of international political matters. Orders given by visiting merchants are responsible for expansion in house trade, which might be greater were it not for cool, wet weather in the West and the belated movement of grain to market. Cereal crops, on the whole, promise excellent yields, prospects in the Northwest being particularly propitious.

The Southern Lumberman—With statistics compiled by the Southern Pine Association showing that yellow pine manufacturers have unfilled orders on hand for over 16,000 cars and that a net reduction in stocks on hand at mills in that association amounted to 3% in July, the optimistic tone to the yellow pine business that became manifest about the middle of July not only continues, but has been considerably enhanced during the past week. Reports from both producing and distributing centers are practically unanimous that business is better. The improvement has also been reflected in the demand for hardwoods.

Marshall Field & Co.—Wholesale dry goods distribution has been lighter in volume than during the same week a year ago. Unseasonable weather continues to effect retail selling adversely.

ATLANTIC SEABOARD

BOSTON

Hampton Roads coals very dull. Railroad asks for bids on supply for part of 1916 and thereafter. Georges Creek demand light and Pennsylvania grades stagnant. Water freights quiet, with steamers now available. Discussion of anthracite possibilities tends to help trade.

Bituminous—The Pocahontas and New River market seems to have reached the apex of dullness for the season. Prices are apparently unchanged either f.o.b. or alongside Eastern points, and shipments on contract have been about normal for this season. The Boston & Maine R.R. is soliciting proposals for transportation for one year and for five years beginning Sept. 1, 1916 and Nov. 1, 1917, and for 720,000 tons of bituminous either f.o.b. loading port or alongside Boston for one year, or 3,000,000 tons for five years, beginning Apr. 1, 1917. It will be interesting to see what shippers are willing to discount the future to that extent.

There would probably be concessions in price among certain of the Pocahontas and New River coals were there any inquiry, but as it is the export trade, in conjunction with curtailed mining, is keeping down the volume of coal standing at the loading piers. Most of the shippers are doing a fair current business and at this writing are perhaps showing less anxiety over the future of the market than since the beginning of 1915.

The demand in New England for Georges Creek is very light just now. The more prominent shippers of this grade have made special efforts to interest the trade in their Pennsylvania coals and each year the tonnage of Georges Creek is likely to diminish in this territory.

Only occasional spot sales relieve the stagnation in the Pennsylvania grades. Prices continue on a minimum basis, and operators are actively canvassing for winter business. Certain of them have named prices a year ahead, subject to advances in wages and tolls.

Water Freights are still nominally 75c. Hampton Roads to Boston, on 3000 tons upward. Steamers are available at the same rate, but so far there have been no takers. Because of dispatch requirements steamers will have to accept less before they are freely chartered in competition with barges.

Anthracite—There has been some discussion of the effect of the recent 15c. reduction in tolls, but it is pretty well understood now that more than that will have to happen to make coal cost any less in New England. Whether there will be any pronounced shortage of labor during the fall and winter is a more pressing matter. There are different views on this and much will depend on how the fall trade starts.

Boston retail prices were advanced 25c. on all sizes, effective Aug. 16. This makes the present basis $7 for broken, $7.75 for egg and stove, $8 for chestnut, and $6 for pea.

Bituminous prices at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$0.85@1.40	$1.15@1.60	$1.67@1.77	
Philadelphia*	2.10@2.65	2.40@2.85	2.92@3.02	
New York*	2.40@2.95	2.70@3.15	3.22@3.32	
Baltimore*			2.85@2.95	
Hampton Roads*				$2.70@2.85
Boston†				3.55@3.68
Providence†				3.45@3.68

* F.o.b. †On cars.

NEW YORK

Month-end spurt creates some activity in anthracite. Considerable interest evidenced in the labor outlook. Slight improvement in bituminous and the outlook regarded as encouraging. Bunkering and export trade active.

Anthracite—With the approach of September a slight improvement is evident in the anthracite market. Not that there is much more coal being shipped but there are more inquiries and sales are now more regular. Even if the retailers have no immediate sale for the coal they will have the boats towed to their plants and discharge as soon as it is possible.

Mining is still restricted to three or four days each week. All of the inactive sizes are going into stock and the storage plants of the various railroads are becoming so filled that capacities will soon be taxed.

The labor situation will soon begin to take definite shape. The general activity in the industry this year will benefit the companies in that they have been able to place so much fuel in stock. The miners are strengthening their forces by more thorough unionizing and Pres. John P. White of the United Mine Workers of America is reported to have promised the men that he will obtain recognition of the union and the eight-hour day if they unionized one hundred per cent.

Stove is the leading domestic size in demand with egg second. There is very little call for chestnut which is still selling at from 30 to 40c. off circular. Pea has bettered its condition moderately and is commanding slightly higher figures. Buckwheat is still long. Rice and barley of the better grades continue in fair demand with loading delayed from two to three days.

The average quotations of the week follow:

	Lower Ports		Upper Ports	
	Circular	Individual	Circular	Individual
Broken	$4.95		$5.00	
Egg	5.20@4.70	$4.90@5.20	5.25	$5.00@5.25
Stove	5.20	4.90@5.20	5.25	5.00@5.25
Chestnut	5.45	5.00@5.45	5.50	5.10@5.50
Pea	3.50	3.00@3.15	3.50	2.75@3.00
Buckwheat	2.75	2.00@2.25	2.80	2.10@2.35
Rice	2.25	1.70@1.85	2.30	1.90@2.10
Barley	1.75	1.45@1.70	1.80	1.65@1.80

Bituminous—There is a slight improvement over last week and sales agents are more cheerful. The usual contract tonnage is moving uniformly with mining being restricted to that amount; consequently there is little spot coal and there are not so many bargains to be picked up as was possible a fortnight ago. A few sales of West Virginia coals have been reported during the week at sacrifices. As many of the manufacturing plants along the Sound and throughout southern New England are making extensive additions the prospect for increased tonnage to these establishments seems good. The holders of the present contracts will no doubt have the first call on the new business but price counts and keen competition is bound to occur.

The bunkering tonnage increased this week as the number of steamers in the harbor was greater than at any time since early in the month. Then too, vessels must take on all coal possible owing to the uncertainty of being able to replenish their supplies abroad. The export business continues to gain strength. Inquiries made last month are rounding into actual business and some large orders have been placed with the leading operators.

Current quotations are on the following basis:

	South Amboy	Port Reading	St. George	Mine Price
Georges Creek Big Vein	$3.20@3.30	$3.20@3.30	$3.20@3.30	$1.75@1.85
Georges Creek Tyson	2.90@3.00	2.90@3.00	2.90@3.00	1.35@1.45
Clearfield:				
Medium	2.65@2.80	2.55@2.65		1.10@1.25
Ordinary	2.55@2.60	2.55@2.60		1.00@1.10
Broad Top Mountain				1.10@1.45
Cambria County:				
South Forks	2.90@3.05			1.35@1.50
Nanty Glo	2.75@2.80			1.20@1.25
Barnesboro	2.65@2.70			1.10@1.15
Somerset County:				
Quemahoning		2.70@2.85	2.70@2.85	1.20@1.30
Medium	2.65@2.70	2.60@2.65	2.60@2.65	1.10@1.15
Latrobe	2.45@2.55			.90@1.00
Greensburg	2.75@2.80			1.10@1.15
Westmoreland	3.15@3.20			1.35@1.45
West Virginia Fairmont ¾		2.60@2.70	2.60@2.70	.80@ .90
Fairmont mine-run		2.45@2.55	2.45@2.55	.75@ .85
Steam		2.45@2.50	2.45@2.50	.90@ .95
Western Maryland		2.40@2.45	2.40@2.45	.85@ .90

PHILADELPHIA

Anthracite slightly improved, although trade continues very dull and little buying being done. Stove plentiful with egg in fair demand, while chestnut lags hopelessly. Pea weak, with other small sizes fair. Bituminous is quiet, with good future and the exports growing stronger.

Anthracite—Probably there have never before been so many coal dealers in Philadelphia away at one time as there has been no one with authority to buy coal. However, despite this condition it is at least possible to report a slight improvement, due in part to a few regular dealers who buy a little toward the end of the month to save the 10c. advance.

Stove is considerably more plentiful, and it is barely possible that the unsettled condition in the tidewater freight rates has had an effect. Egg is still in fair demand, especially since the New England market continues to take quite a tonnage of this size. Chestnut lags hopelessly, as it has for some time, and pea has not stiffened any. Several fair sales of this latter size are reported at $1.60, with an adjustment of 10c. a ton to equalize the freight rate. The other steam sizes are fairly strong, but the demand is easily met, even with the collieries on reduced time, besides which there are several idle washeries that could be worked in case the call for these sizes should become greater.

Practically all dealers are apparently carrying capacity stocks. The condition of the market, from the standpoint of the retailer, has been such as to make the policy of stocking heavily a sure thing, especially since most of it has been done with the operators' capital. Owing to the large supplies on hand it is extremely difficult now to induce them to take in more coal, even if they had room for it.

However, it is only a matter of a very short time when some of this coal will begin to move.

The recent and continued price-cutting has made the large operating companies realize the growing strength of the individuals and it will not be surprising to see some unusual efforts put forth by the sales agents of the big companies early this fall. It is known that this question has been given considerable thought and consideration during the summer and it is likely that the plans will be developed in a short time, although the recent rate decision may have a tendency to modify any arrangement to this end.

The circular prices, to which should be added the Pennsylvania State tax of 2½% per ton, are as follows:

	Line	Tide		Line	Tide
Broken	$3.40	$4.65	Pea	$2.50	$3.25
Egg	3.65	4.90	Buckwheat	1.25	2.25
Stove	3.90	4.90	Rice	.85	1.75
Chestnut	4.05	5.15	Barley	.50	1.50

Bituminous—While the trade is still quiet there are indications that an increased demand will soon be in evidence. Additional furnaces and steel plants are going into operation and increased time is noted at other plants. The trade was quite surprised at inquiries being received from England the past week and these together with the continued requests from other foreign lands is keeping the export business brisk, with prices good and showing indications of doing better.

In the domestic trade there has been no change in prices but with a labor shortage becoming more apparent weekly many of the small operators are inclined to accept business at a reduced price rather than have their operations shut down and their force scattered. Formerly in time of need the operators could send a representative to meet incoming immigrant ships and secure all the labor needed, but all of this is now changed. Slack coal still continues in active demand, but without any perceptible change in price.

The ruling prices are:

Georges Creek Big Vein	$1.65@1.75	Fairmont gas, mine-run	$1.15@1.25
South Fork Miller Vein	1.50@1.60	Fairmont gas, slack	.70@ .80
Clearfield (ordinary)	1.00@1.20	Fairmont lump, ordinary	.85@ .95
Somerset (ordinary)	1.00@1.15	Fairmont mine-run	.75@ .80
West Va. Freeport	.85@ .95	Fairmont slack	.55@ .65

BALTIMORE

Trade slowly stiffening. Fall outlook most encouraging. Orders increasing. Car shortage more evident, and lack of labor being felt.

Many buyers are now feeling out for more coal. Mine operators are showing less inclination to sell at recent prices, at least in any quantity. Low grade coals of West Virginia and Western Maryland go at less than 80 and 85c. now, while the more ordinary products of Pennsylvania are holding at from 90 to 95c.

Reports of a car shortage are coming in. A number of operations along both the Pennsylvania and Baltimore & Ohio reported not more than 20 to 50 per cent. of their apportionment delivered during the week. With the demand on contract now coming closer to normal and new business developing, some embarrassment was occasioned. Growing scarcity of labor is worrying many operators, also. Thousands of miners have returned to the old countries, while others have been drawn to more lucrative lines. The labor situation is likely to be an important factor this fall and winter.

Export business, which suffered a relapse the second week of the current month, picked up again the past week, when a total of 52,194 tons was loaded here for foreign ports. With the large number of charters announced recently it is expected that this business will more than hold its own.

HAMPTON ROADS

Week's movement shows up well. Prices unchanged on standard grades. Foreign demand continues heavy. Occasional shortages of coal.

During the week all of the piers have been well supplied with vessel tonnage which has been taken care of promptly. In the case of the Chesapeake & Ohio Ry. at Newport News they have been compelled to put into operation again their old wooden pier No. 12 where considerable barge and schooner tonnage has been taken care of.

In addition to the export movement to Italian ports there has been some large cargoes to the South American market, while the coastwise shipments have shown up well and the government has also taken some cargoes. The American steamer "Newton," which has heretofore been in the Eastern coastwise trade, loaded a cargo of about 7000 tons for the government for delivery at San Francisco.

Although the quantity of coal on hand appears somewhat excessive it is noted that a number of the larger shippers are having considerable difficulty keeping sufficient coal at Tidewater to take care of vessel tonnage as fast as it arrives.

The demand for coal for prompt movement foreign is still holding up well with every indication of continuing so. Prices are practically unchanged on the standard grades of mine-run coal.

The outlook is bright for record dumpings by the Chesapeake & Ohio Ry. during the month of August, while those for the Virginian Ry. will also be heavy but it is difficult at this time to make an estimate on the Norfolk & Western figures although it is not believed that this road will go above its July dumpings.

Railroad Tonnages—Dumpings over the local piers for the past several weeks compare as follows:

	Week Ending				
Railroad	July 24	July 31	Aug. 7	Aug. 14	Aug. 21
Norfolk & Western	197,913	188,593	135,357	171,252	....
Chesapeake & Ohio	96,627	84,018	110,861	83,390	129,826
Virginian	86,523	39,335	64,397	63,066	77,136
Totals	381,063	311,949	310,515	317,708	206,962

OCEAN FREIGHTS

A number of steamers to load coal for South American, Mediterranean and West Indian ports have been chartered during the past week; freight rates to these destinations are stronger than a week ago, especially to West Italy. The grain competition is increasing and the general impression is that rates on coal will advance rather than decline.

The freight market is now quotable as follows:

To	Rate	To	Rate
Havana	$2 75@3 25	Bermuda	**$3.00**
Cardenas or Sagua	3.00@3.50	Vera Cruz	3.25@3.75
Cienfuegos	3.25@3.50	Tampico	3.25@3.75
Port au Spain, Trinidad	3.50	Rio	8.28@8.40
St. Lucia	3.25@3.50	Santos*	8.40@8.64
St. Thomas	3.00	Montevideo	**8.04**
Barbados	3.50	Buenos Aires or La Plata†	**8.04@8.16**
Kingston	3.00@3.50	Rosario	**8.40**
Curacao	3.25	West Coast of Italy	9.84@10.08
Santiago	3 25@3.50	Barcelona**	8.66@9.00
Guantanamo	3.25@3.50	Valparaiso or Callao	7.00
Demerara	4.50@5.00	Marseilles	9.00@9.24

Note—Rates noted in **bold face** type are only approximate.

* Consignees paying dockage dues. ** Spanish dues for account. † Quotations on Plate coal by British steamers; neutral steamers are more difficult to obtain and the rates are always higher.

W. W. Battie & Co.'s Coal Trade Freight Report.

Note—Charters for Italy, France and Spain read: "Lay days to commence on steamer's arrival at or off port of discharge. 24c. per net register ton per day demurrage."

OCEAN CHARTERS

[2] New River Coal Co.

LAKE MARKETS

PITTSBURGH

Market decidedly improved, with heavy line demand, and operations up to fully 60% of capacity. Free coal stronger and contract coal higher.

A much more cheerful tone pervades the Pittsburgh coal market. With the continued improvement in steel mill operations as well as some improvement at foundry and machine shops, the line demand is fully up to normal. The railroads are taking slightly increased quantities of coal. Lake shipments are as poor as formerly, and nothing better is now expected of the Lake trade than perhaps a slight spurt toward the close of the season.

The increased demand for coal is chiefly against contracts and the market for free coal has not improved materially, though prices lately quoted in these reports are now being adhered to very strictly. For contract coal the market is definitely stronger, there being practically no sellers at less than $1.15 for mine-run to Apr. 1, representing a total advance of fully 10c. per ton in the past 60 days in the case of contract.

Coal output has increased slightly in the past fortnight, and it is conservatively estimated that the Pittsburgh district is now operating at fully 60% of its capacity, some estimates being considerably higher than this.

The market for free coal is strong at the following figures: Slack, 50@60c.; nut and slack, 90@95c.; nut, 95c.@$1; mine-run, $1.@1.05; ¾-in., $1.10@1.15; 1¼-in., $1.20@1.25, per net ton at mine, Pittsburgh district. On contracts to Apr. 1 the market is firm as follows: Slack, 85@95c.; mine-run, $1.15; ¾-in., $1.25; 1¼-in., $1.35.

BUFFALO

Still a small improvement in bituminous, just enough to make the dealers anxious. One encouraging point is in better railroad activity. No increase in Canadian demand. Anthracite still quiet.

Bituminous—The movement increases week by week, but the volume is not yet very large. A good many business men are away for the summer which is delaying buying; they will buy coal when they return if the general conditions still improve and if not they will wait. There is complaint here and there of dullness but a quiet trade is the best, for it does not stimulate production unduly.

There is more buying on the part of the railroads than there was and this is expected to continue for some time; the roads have not had much of a supply for a long time and they will need more if they are to move the fall crops. Some of them are also anticipating labor troubles in the spring, though this is to early to buy for anything of that sort.

There is much report of the Canadian trade just going to settle down to a normal activity, but so far it has failed to do so. As it looks now the Canadian trade is not going to be of much consequence for the time being at least. The wheat crop there is large, but it is not stimulating business. There is not much coal on track here at present. Some of the worst delinquents in that line are reporting that their coal is all sold before it reaches here. Quotations remain on the basis of $2.70 for best Pittsburgh lump, $2.55 for three-quarter, $2.45 for mine-run and $2.25 for slack.

Anthracite—The consumer is not ready to buy yet. All reports agree that there is much less coal in the home bins than usual, but the consumer has an idea that he can get his supply the same day he orders it, even if he waits till late fall. Shippers anticipate a clamor then that has not been equaled lately. The mines have not increased their running schedules and will not do so till there is more buying. If the demand then exceeds the supplies there will have to be a large increase of storage capacity provided on the Upper-Lake docks.

The rail lines are not moving much coal and the lake docks are not as active as they were a year ago, which means that there will be a shortage when the season closes, in spite of the congestion at storage centers. Lake shipments for the week were 112,500 tons.

COLUMBUS

Fairly good demand for steam grades and prices well maintained. Domestic trade slow, due to the excessive rains. The tone of the market is only fair and future prospects are not bright.

The domestic demand has been rather sluggish in Columbus and central Ohio territory during the past week. The heavy rains have affected the trade both in cities and rural districts. Buying on the part of dealers is restricted because of fair stocks and they are loath to invest any more than is necessary. Rains in the country have prevented farmers from hauling their winter's supply of fuel. Threshing has been long drawn out and the amount of coal required is not as large as formerly. Retail trade is slow, though prices are well maintained.

Steam business is better as manufacturing appears to be on the up grade. Munitions factories especially are active and a considerable amount of coal is required to keep them running. As a result of the better demand contracts are being looked after more closely and there is not so much cheap fuel offered on the open market. Strength is shown in the small sizes as there is still a better demand than can be supplied by Ohio operators.

Lake trade is slow and not much improvement is expeced for the time being. The docks of the upper lake ports are still congested and the movement to the interior is slow. A large part of the tonnage going to the Northwest is from West Virginia mines.

There is still a good demand for anthracite in Columbus territory; the consumption is much larger than usual. Coke trade is also showing some signs of increased activity.

Prices in Ohio fields are as follows:

	Hocking	Pomeroy	Kanawha	Eastern Ohio
Rescreened lump	$1.45	$1.50		
Inch and a quarter	1.35	1.35	$1.30	$1.25
Three-quarter inch	1.25	1.25	1.25	....
Nut	1.15	1.25	1.15	....
Mine-run	1.05	1.10	1.05	1.00
Nut, pea and slack	65	.65	.65	.55
Coarse slack	55	55	.55	.45

Mines have been working at about the following percentages of full capacity:

	Week Ended					Week Ended			
District	July 31	Aug. 7	Aug. 14	Aug. 21	District	July 31	Aug. 7	Aug. 14	Aug. 21
Hocking	15	25	25	30	Cambridge	30	30	35	35
Jackson	20	20	20	20	Masillon	25	25	30	50
Pomeroy	35	25	40	40	Eastern O.	50	30	55	55
Crooksville	20	30	30	30					
					Average	29	30	33	34

CINCINNATI

Demand poor but a car shortage has helped to strengthen prices. Heavy domestic buying is expected to begin at any time.

Slightly better prices are noted in spite of the fact that buying is very light on both sides of the market. The improved strength is due to the shortage of cars, which was reported nearly every day. The retail trade is still holding off, and the domestic market, in consequence, remains extremely dull. Inasmuch as stocks are known to be low everywhere, however, it seems certain that buying for the usual winter demand must begin soon, and this should strengthen the market very materially. At the same time, it is also probable that an increased movement of the prepared grades will weaken the steam market, on account of the increased production of screenings. The general industrial situation is not improved, and the grave danger of European complications has not helped it any.

TOLEDO

Conditions improve at Toledo considerable coal going up the Lakes. Wet weather delays buying.

The improvement noted here for several weeks is holding. Hard coal is moving a little better and domestic business is expected to increase shortly. Smokeless coal, including the Pocahontas variety is not holding as firm as was expected and there is some shading of prices in order to secure business. Lake shipments continue but are by no means as heavy as usual for this season of the year. Steam coal continues rather weak, although factories are beginning to run better and it is expected that the first of the year will find many of the factories again contracting.

CLEVELAND

The market has been dragging for more than a week. Stocks large. Lake business begins to show signs of improvement.

All last week there was an excessive supply at this point; companies that have not paid car service for several weeks were caught last week. With 400 cars at the opening of last week the market was not cleaned up by Saturday night and 300 cars arrived over Sunday. Monday night about 160 cars of coal were on track unsold. Prices were maintained in spite of the large amount of spot coal, but this was due principally to the fact that there was no one to accept the coal even at a cut.

The Lake business is beginning to improve. Some shippers who own boats have enough coal to load all their ships due here this week. This is unusual as none of the fleets have had a full tonnage of coal in any week since spring. All of the ships that were at dock have been fitted out or are now being fitted out. Two ships left Lorain last week with cargoes of coal loaded last winter.

The real excitement on the lakes is the large tonnage of ore handled during the last thirty days. Not since 1907 has so much ore been offered to the ships the last half of the season. Shippers Monday sought out the ship managers to give ore contracts but few of these fleet operators can carry any more ore than is now under contract.

Though the Lake coal traffic has been dull this season, there is reason to believe it will be practically normal the rest of the year. Stocks in the Northwest are small although the upper lake docks are full. The movement to the interior is growing larger and as the dealers must stock against a miners strike next spring, there will be a larger movement to the interior than has been predicted.

Quotations for shipment to jobbers are as follows:

	Pocahontas	Youghiogheny	Fairmount	Bergholz	Ohio No. 8
Lump	$3.70			$2.30	
Lump, 6-in.				2.30	
Lump, 1¼-in.				2.10	$2.10@2.15
Lump, ¾-in.		$2.15@2.20	$2.00	2.00	2.00
Egg	3.70			1.95	
Mine run	2.70	2.10@2.15	1.90	1.85	1.80@1.85
Slack		1.55	1.70	1.50	1.50

DETROIT

Quantity of consignment coal much reduced and the market steadier. Stocking by consumers considerably less than normal.

Local manufacturing establishments and retail yards have made little apparent effort to stock up for future requirements. Until about two weeks ago steam and domestic coal was being shipped into the local market in such quantities that large amounts of both remained on railroad tracks coming to forced sale at prices which unsettled the market in all lines. The steam users, by buying judiciously have been able to supply their requirements whenever the necessity arose at low figures. The quantity of consignment coal arriving is not excessive now and a steadier trend has developed in prices. The steam coal users are now buying in small lots, evidently hopeful that new opportunities will arise to get cheap coal. Shippers find encouragement, however in the fact that the small orders are numerous.

Neither domestic sizes nor anthracite are being bought liberally. Retail dealers say their customers are doing very little in the way of putting in winter supplies and that they do not care to accumulate excessive stocks. In the Lake trade, freighters carrying down iron ore and grain are making the upbound trip from Lake Erie ports without cargo, more often than with coal. The sluggish conditions in the Lake trade is the result of the delayed movement from the head of the lakes.

LOUISVILLE

Better movement but not much change in prices. Some increased demand from cotton mills.

A better movement of Kentucky coal is noted though this is not accompanied by much, if any, stiffening in prices. As has been the case for several weeks, however, there is said to be more coal moving at the higher price levels. The present movement is due to the retailers trying to get their supplies in before the large movement begins next month; at least the operators hope it will develop, though heretofore this year all signs have generally failed.

Inclement and abnormal weather has limited the farmers' stocking movement which was getting under way. The steam coals are somewhat quicker, the Southern cotton seed mills being in the market for a considerable volume. Prices are not much, if at all changed, the block coals for the most part ranging from $1.25 to $1.50, with the especially fancy coals from $1.80 to $1.90, and the bulk of the best nut and slack going at from 50 to 55 cents, all prices f.o.b. mines.

COKE

CONNELLSVILLE

Furnace coke still dull and inactive but with hopes of better prices later in the year. Foundry coke demand improved further. Production and shipments slightly increased.

The furnace coke market seems to be under less pressure from surplus coke, but prompt is still available at $1.50 in limited tonnages at least. Shipments have increased on several contracts, in cases in which the furnace interests recently asked for a curtailment on account of the stacks working badly and not requiring their normal tonnages, but in several instances contract shipments are still below the normal. There is scarcely any inquiry for furnace coke for shipments over the remainder of the year. Some inquiry has developed for the first six months of next year but so far as known the operators have refused to quote for that delivery. They still seem to expect that however unsatisfactory the market has been in recent weeks there will be a firming up before the end of the year.

Foundry coke demand has increased still more. There is heavier buying of prompt lots and shipments on regular contracts have been increased in many cases. Shenango Furnace No. 4 at Sharpsville has just gotten into blast, using coke produced at its own works in the Ligonier district. Claire and Fannie, in the Shenango Valley, are expected to blow in shortly. The market is quotable as follows: Prompt furnace, $1.50@1.55; contract to Oct. 1, $1.65@1.70; contract to Jan. 1, $1.85@2; prompt foundry, $2.25@2.60; contract foundry, $2.30@2.60, per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Aug. 14 at 374,413 tons, an increase of 7573 tons, and shipments at 378,865 tons, an increase of 9140 tons.

Buffalo—There is not much change in the situation. Some shippers are not very enthusiastic over the outlook; they say that the reports are hardly borne out by the actual improvement. While the trade is more active than it was in the spring the prices are not much higher. At present the quoted price is on the basis of $4.25 for best Connellsville foundry and $3.30 for stock coke.

Chicago—The metallurgical coke market seems to have hardened somewhat because of the steadily increasing demand. Byproduct sizes have gone forward in increasing volume. Quotations are as follows: Byproduct foundry, $4.85@5.10; byproduct domestic, $4.60@4.75; Connellsville, $4.75@4.85; Wise County, $4.75@4.85; gas coke, $3.75@3.90.

MIDDLE WESTERN

GENERAL REVIEW

Market shows some strengthening in spots. Rate decisions cause a general hesitancy. Screenings steady. Some betterment in anthracite buying.

The situation shows no backward tendencies and has some encouraging aspects. There is more booking of small orders at fair prices, which in the aggregate amount to a considerable tonnage. Retail buying is gaining more momentum, and there is a broader market for steam coals. The buying is less spotty and the trend slowly upward.

Domestic sizes have moved in moderately increasing volume. The decline in screenings seems to have stopped, and they have hardened somewhat during the past week, selling on an average of 70c. to 75c. Business conditions in the Northwestern markets are improving; the crops of this section are showing substantially better than an average yield, and the depression in that territory seems to be about over. The demand from Northwestern interior points shows a steady increase, and there should be a stronger call for bituminous coal for threshing and domestic uses very shortly.

Lake trade is slow, and there seems to be no hope of improvement in the immediate future. Congestion on the docks of Upper Lake ports is still reported, and movement of dock coal to interior points is very slow. In the Middle West farmers do not seem to be buying coal as readily as in former years. This may be due to the excessive rainfall which has delayed their work and prevented them from hauling their usual supply of winter fuel. Some of the larger railroad systems are stocking up to guard against emergencies. Outside of Kentucky production, there is less cheap coal offered at the present time than ever before, and although the average running time of all mines is still only a little over three days per week, prices are well maintained.

CHICAGO

Price advances announced for Sept. 1 stimulate some month-end buying. Threshing demand has been disappointing. Eastern coals heavier. Anthracite moving better.

Franklin County domestic lump prices have ranged from $1.35 to $1.60 during the week, but it is said that most shipments have been going forward at around $1.40, and very few at the circular of $1.60. The demand is steady, and egg and nut have been moving a little better for the last few days. It is expected that an advance of 10c. a ton will be announced Sept. 1 on domestic sizes. Carterville domestic lump is in steady demand at as high as $1.60, and No. 1 washed has been strong at $1.65. Williamson County prepared sizes are moving forward at around $1.50, and the demand has bettered slightly.

Railroad shipments from the Springfield district have increased slightly during the past week. The decline in screenings has ceased and the forwarding of domestic sizes has slightly improved.

Some improvement is apparent in the demand for Indiana coals. The retailers are beginning to buy domestic sizes for early fall trade. Domestic shipments for threshing trade are about over and the volume of this business was much less than in previous years. Steam coals seem to be picking up due to more activity in the iron and steel industries. Screenings have been in fairly good demand.

Knox County operators have been shipping more steam coal than anything else, and as a consequence mine-run and screenings have been stronger than domestic sizes; screenings have been selling as high as 85c. and 90c.

Sullivan County mines have been working close to three days this week. Clinton County mines are producing mainly steam coal, and the call for domestic sizes is very slow. Screenings are a little stronger.

An easing off has occurred in the demand for Pocahontas and New River prepared sizes. A record-breaking business was done in July both in prices and tonnage, but the Western territory did not respond to present efforts to stimulate shipments. Orders were large toward the end of the month in anticipation of the price advance on Sept. 1. Splint is improving. Nut and slack is in good demand, while mine-run is very weak. There seems to be little free nut and slack on the market. Some jobbers during the last week have forced lower quotations on spot business, but there is still firmness shown in the prices quoted by standard operators for free coal.

The Kentucky situation is slightly better, but there is still plenty of free coal sacrificed at low prices.

Anthracite as a whole has been moving in better volume. The country business has improved, dealers showing more of a disposition to take the coal they ordered earlier.

Quotations in the Chicago market are as follows:

	Williamson and Franklin Co.	Springfield	Sullivan	Clinton	Knox and Greene Cos.

	24,332	28,204	25,227	23,068
August total	71,612	113,460	115,803	79,167
Season total	451,011	340,700	417,515	415,475

INDIANAPOLIS

Seasonable improvement in the volume of trade, especially in domestic lump. Screenings in good demand at top prices of the season. Retailers pushing sales, anticipating foreign demand.

The Indiana coal situation shows the usual improvement over summer conditions, due to the approach of fall though the increase is not large. In past years it has been customary for retailers to make their first price advances in September and this usually stimulates buying of domestic grades in August. In other departments the improvement is caused by the opening of plants that pack tomatoes, corn, beans, etc.

The wet weather has prolonged the threshing season and so the demand for lump continues from that direction. Slack is still moving well at the recent better prices, 70 to 80c. for Nos. 5 and 6 and 85 and 90c. for No. 4. Some of the large operators are temporarily out of the market, having covered their output.

ST. LOUIS

Movement light and demand below normal for this period. Full winter circular in effect Sept. 1.

The market the past week has been listless and the movement light. There has not been the improvement in the demand that the middle of August usually brings. Prices are gradually advancing on lump and egg. By Sept. 1, when the full winter circular will be restored, the situation should begin to improve. However, dealers are said to be fairly stocked and not much change is expected until the consuming public begins to call for heavier deliveries.

Prices are as follows:

	Wilm. & Frnk. Co.	Sparta	Mt. Olive	Standard
6-in. lump	$1.35@1.50	$1.20	$1.50	$1.00
2-in. lump	....	1.10	1.35	.90
3-in. lump	....	....	1.35	....
3x6 egg	1.35@1.50	....	....	.90
No. 1 nut	1.25	....	....	....
No. 2 nut	1.10@1.15	....	....	.75
No. 1 washed	1.65	....	1.50	....
No. 2 washed	1.35	....	....	....
No. 3 washed	1.25	....	....	....
No. 4 washed	1.20	....	....	....
No. 5 washed	.80	....	....	....
Screenings	.55	.55@ .60	....	.55

KANSAS CITY

There has been very little change in the prices in Kansas City in either the retail or the wholesale market during the past month. There has been a slight decrease of a few cents in some grades with the market running very slow. The companies believe that the prices are due to increase next week and are looking forward to the beginning of a better business then.

PRODUCTION AND TRANSPORTATION STATISTICS

PENNSYLVANIA RAILROAD

The following is a statement of shipments over the P. R.R. Co.'s lines east of Pittsburgh and Erie for July of the current year and the seven months of 1914 and 1915, in short tons:

	July		Seven Months	
	1915	1914	1915	1914
Anthracite	653,020	693,545	6,076,487	6,347,822
Bituminous	3,668,146	3,966,357	23,929,923	27,521,539
Coke	1,091,344	847,135	6,090,263	6,075,020
Total	5,412,510	5,507,037	36,096,673	39,944,381

I, C. C. DECISIONS

Investigation and suspension docket No. 344—Coal rates from Oak Hills, Colo.

This proceeding is supplementary to that reported in 30 I. C. C., 505. The carriers having published the joint rates therein fixed by the Commission failed to agree upon the divisions thereof. The initial line thereupon petitioned the Commission to make an order prescribing the just and reasonable divisions of such joint rates to be received by each carrier party thereto. Divisions prescribed.

Investigation and Suspension Docket No. 458—Anthracite coal rates to Chicago, Ill., and other points.

Following "Rates for Transportation of Anthracite Coal," 35 I. C. C., 220, the proposed increase of 25c. per gross ton on anthracite coal, "prepared sizes," from Pennsylvania mines to Chicago, Ill.; to points taking Chicago rates; to connecting points between eastern and western lines near Chicago, such as Joliet and Kankakee; and to the other connecting points, Peoria, East St. Louis, and St. Louis, justified.

Investigation and Suspension Docket No. 569—Bituminous coal and coke rates from mines and ovens in Alabama, Illinois, Kentucky, and Tennessee to Mississippi River crossings and various junction points in Tennessee, Mississippi, and Louisiana.

1. Proposed increased rates on coal to New Orleans, La., Memphis, Tenn., Greenville, Natchez, and Gulfport, Miss., Baton Rouge, La., and certain other points in Mississippi and Louisiana justified.

2. Proposed increased rates on coal to Jackson, Vicksburg, Newton, and certain other points in Mississippi and Tennessee not justified. Increased rates to Vicksburg from Illinois and Kentucky justified.

3. Certain increases as shown herein to Meridian and other Mississippi points, and to Jackson, Milan, and other points in Tennessee, justified.

4. Increased rates on coke to Mississippi Valley points justified.

FOREIGN MARKETS

GREAT BRITAIN

Aug. 13—The coal industry is still hampered to a great extent by the Price of Coal (Limitation) Act and the licensing regulations. The latter, it will be remembered, apply to allied as well as neutral countries on and after today (August 13), and it will probably be some little time before the trade adjusts itself to the restrictions now imposed upon it. For the moment the amount of new business passing is not large, either in the inland or the shipping branches of the industry. The Board of Trade returns show that our exports of coal, coke and patent fuel last month were no more than 3,732,000 tons, as compared with 7,275,000 tons in July, 1913; but the total value has not fallen off proportionately, for the average value per ton last month was $4.18, whereas in July last year it was only $3.26. At the same time, our receipts from the export trade were only 22 millions sterling in the seven months now completed of this year, as compared with 31 millions in the corresponding period of 1913. The bunkering business has also fallen off during the same period from 12 million to 8,500,000 tons.—"The Iron & Coal Trades Review."

Exports—British exports for July and the first seven months of the past three years were as follows:

[1] Includes Azores and Madeira. [2] Including Anglo-Egyptian Sudan. [3] And dependencies. [4] And Canaries. [5] West Africa.

Note—The figures in the above table do not include Admiralty and certain other shipments.

Coal Contracts Pending

The purpose of this department is to diffuse accurate information of prospective purchases and prices with a view to affording equal opportunity to all, promoting market stability and inculcating sound business principles in the coal trade.

For the official advertisements of bids wanted see the Contracts-to-Be-Let Section on Page 12.

✚Indicates contracts regarding which official information has been received.

Recast

In the following table we give a list of all old contracts coming up for consideration during the ensuing week. The table gives our contract number, the name of the purchaser, city, tonnage and page on which the detail notice appeared.

No.	Purchaser	City	State	Tonnage	Page
1134	Board of Education	Butte	Mont.	3,000[1]	198
1135	Louisville Provision Co.	Louisville	Ky.	2,400b	198

a Indicates anthracite coal. b Indicates bituminous. [1] Per year. [2] Per month. [3] Per week.

Supplemental Notes

Under this heading additional or supplemental information regarding old contracts appears, together with the page number of the original notice.

1090—Columbus, Ohio—Bids on this contract (p. 117), which provides for furnishing the Public Service Department with coal have been received as follow: SCIOTO RIVER pumping station, approximately 3500 tons. Elk Coal Co., Columbus, Hocking mine-run $1.44, Cambridge mine-run, $1.46, West Virginia mine-run, $1.42; New York Coal Co., Columbus, Hocking mine-run, $1.60; Fletcher-William Co., Columbus, West Virginia mine-run, $1.45; Gem Coal Co., Nelsonville, Hocking mine-run, $1.53; Victoria Coal Co., Columbus, Hocking mine-run, $1.48. MUNICIPAL LIGHT plant, 10,000 tons. Victoria Coal Co., Columbus, Hocking nut, pea and slack, $1.19; Fletcher-Williams Co., West Virginia nut, pea and slack, $1.12. GARBAGE REDUCTION plant, 3000 tons. Fletcher-Williams Co., Columbus, Hocking nut, pea and slack, $1.19½, West Virginia nut, pea and slack, $1.12; Victoria Coal Co., Columbus, Hocking nut, pea and slack, $1.19. City hall, Schiller Park, water-works shop, State St. yard, Goodale Park and the Recreation department, approximately 1000 tons delivered. Franklin Builders' Supply Co., Columbus, various bids of $2.29; $2.05,; $2.60 and $2.10 for Hocking lump; J. Rapp & Co., Columbus, Hocking lump, $2.30 for all places; M. A. Suydam & Co., Columbus, $2.17½ for all places, forked lump. This is the second opening of bids on this contract. All former proposals being rejected because of the reduction of 15c. on the freight rate from the Hocking Valley field which would affect the delivered price. There was some reduction in the bids as a result. The contract will be awarded within a short time. Address Clk. Paul B. Kemper, Public Service Comr., Columbus, Ohio.

1249—Ellwood City, Penn.—Bids will be received on this contract (p. 284), which provides for furnishing the fuel requirements of the local Board of Education until 8 p.m., Sept. 7. Address Secy. W. J. Moore, Bd. of Edu., Ellwood City, Penn.

✚1174—Canton, Ohio—Bids on this contract (p. 243), which provides for furnishing the local Board of Education with coal during the ensuing year will be received until noon, Aug. 23. Bids are requested on Pittsburgh No. 8 three-quarter coal or its equal. All bids must be accompanied by a certified check for $100. Address Clk. W. C. Lane, Bd. of Edu., High School Bldg., Canton, Ohio.

✚1176—Topeka, Kan.—The tonnages involved in this contract (p. 243), which provides for furnishing the local Board of Education with coal during the ensuing year, are as follows: 200 tons of lump; 200 tons of slack; 2000 tons of nut coal. Bids will be received until 5 p.m., Aug. 31. Address Clk. M. C. Holman, Bd. of Edu., Topeka, Kan.

New Business

✚1301—Pewee Valley, Ky.—The Confederate Home has advertised for bids for its winter supply of coal delivered at the home. Proposals on mine-run, lump and nut are required. Address Commandant Henry George, Pewee Valley, Ky.

✚1302—Wilbur, Wash.—School District No. 59, at this place will receive sealed bids until Sept. 1, for furnishing 75 tons of steam coal to be delivered to the high school building. Address Clk. H. E. Jones, School Dist. 59, Wilbur, Wash.

✚1303—Johnstown, Penn.—The Borough of Oakhurst will receive bids until 7:30 p.m., for furnishing a good quality of mine-run coal as may be required during the ensuing year. Address Secy. J. P. Orner, Oakhurst, Johnstown, Penn.

✚1304—Jackson, Ohio—The Lick Township Board of Education will receive bids until noon, Aug. 28, for furnishing and delivering coal to the various school buildings during the ensuing year as may be required. Address Clk. R. K. Schellenger, Bd. of Edu. Lick Township, Jackson, Ohio.

✚1305—Hubbard, Ohio—The Board of Education at this place will receive bids until noon, Sept. 3, for furnishing 1¼-in. screened coal delivered in the basement of the school building, as may be required during the ensuing year. Address Clk. Clyde Smith, Bd. of Edu., Hubbard Village School Dist., Hubbard, Ohio.

✚1306—Billings, Mont.—Bids will be received by School District No. 2, until 4 p.m., Sept. 2, for furnishing the coal as may be required during the ensuing year. Bids may be submitted f.o.b. cars at Billings or delivered to the school buildings. Proposals are also requested for delivery alone. Address Clk. A. J. Thorine, School Dist. No. 2, Yellowstone County, Billings, Mont.

✚1307—St. Louis, Mo.—Sealed bids were received until noon, Aug. 23, for furnishing the Water Department with approximately 37,000 tons of egg coal and 3400 tons of screenings to be delivered during the ensuing year. All bids were to be accompanied by a certified check for $500 and the successful bidder will be required to furnish a bond for not less than $5000, guaranteeing the satisfactory performance of the contract. The contract is to become effective Sept. 1, and will expire July 31 of next year. Address Supply Comr. Joseph B. Thomas, City Hall, St. Louis, Mo.

✚1308—Shoals, Ind.—The commissioners of Martin County will receive bids until 10 p.m., Sept. 1, for furnishing coal as may be required at the County Court House and jail during the ensuing year. Address Audr. L. D. Haga, Bd. of Comrs., Shoals, Ind.

✚1309—Cedar Rapids, Iowa—Sealed proposals were received until 10 a.m., Aug. 27, for furnishing the local City Government with approximately 300 tons of bituminous lump and 50 tons of anthracite coal. Address City Clk. L. J. Storey, Cedar Rapids, Iowa.

✚1310—Sidney, Ohio—Sealed proposals were received until Aug. 7, for furnishing the coal required at the local Water Works during the year beginning Sept. 1. Address Dir. C. B Deweese, Sidney, Ohio.

✚1311—Cheney, Wash.—The State Normal School at this place will soon advertise for coal to be supplied during the ensuing year. Address Superintendent, State Normal School, Cheney, Wash.

✚1312—Montevideo, Minn.—The County Board of Chippewa County received bids until 2 p.m., Aug. 20, for furnishing and delivering coal as required during the coming year. Bids are requested on Youghiogheny coal. Address County Audr. J. J. Stennes, Montevideo, Minn.

1313—Boston, Mass.—The Boston & Maine R.R. asks for bids on water transportation, on the coal delivered f.o.b. loading pier, and for coal delivered alongside Mystic Wharf, Boston, each for a period of one year from the dates of expiration of present charters and coal contract and for a period of five years from the dates. For previous purchase by this road see Contract 172, Vol. 7, p. 399. It is explained that the railroad now has a charter for a 7500-ton steamer carrying coal from Hampton Roads and Baltimore which expires Aug. 29, 1916, another charter expiring Oct. 31, 1917 and a contract for approximately 720,000 tons per year of locomotive bituminous coal which expires Apr. 1, 1917. Bids are asked at this time "in order to determine the most advantageous terms in contracts and charters to cover this business at the expiration of the present contracts. Bidders are asked to submit proposals on forms, in outline as follows: Schedule A: Steamer charter for one year and for five years starting Sept. 1, 1916. Schedule B: Steamer charter for one year and for five years starting Nov. 1, 1917. Schedule C: Contract for approximately 720,000 gross tons of bituminous, to be delivered on steamer at loading pier in one year commencing Apr. 1, 1917. Schedule D: Contract for approximately 720,000 gross tons of bituminous, to be delivered alongside Mystic Wharf, Boston, in one year commencing Apr. 1, 1917. Schedule E: Contract for approximately 3,600,000 gross tons of coal f.o.b loading pier, to be delivered in five years. Schedule F: Contract for approximately 3,600,000 gross tons of coal alongside Mystic Wharf, to be delivered in five years. All bids must be in by Sept. 10. Address B. S. Hinckley, Boston & Maine R.R., Boston, Mass.

✚1314—Wellston, Ohio—The Board of Education received bids until noon, Aug. 21, for furnishing and delivering No. 2 and No. 4 lump coal as may be required to the various school buildings during the ensuing year. Address Clk. C. L. King, Bd. of Edu., Wellston City, Ohio.

✚1315—Keytesville, Mo.—The County Court will receive bids until Aug. 30 for furnishing the local Court House and jail with Illinois coal, to be delivered before Nov. 1. Address County Clk. W. W. White, Keytesville, Mo.

1316—Minot, N. D.—Sealed bids were received by the School Board of Dist. No. 128 for furnishing coal for the Consolidated Schools during the ensuing year. Bids were received until Aug. 21. Address Clk. Thomas R. Drady, Burt School Dist., Minot, N. D.

✚1317—Hutchinson, Minn.—The Board of Education for Dist. No. 2 received bids until 8 p.m., Aug. 23, for furnishing 250 tons of Youghiogheny lump coal delivered at the local schools. All bidders were required to designate the heat value of the coal they propose furnishing. Address Secy. Henry Braun, Bd. of Edu., Dist. No. 2, Hutchinson, Minn.

✚1318—Carthage, Mo.—Bids will be received by Jasper County until Sept. 1 for furnishing the best quality deep shaft, lump, mine-run, nut and slack coal, as may be required at the Court House, County Jail and County Almshouse, during the ensuing year. Bids should indicate prices on the different grades of coal both on track at the railroad and delivered in bins at the places noted. Address County Clerk, Jasper County Court House, Carthage, Mo.

✚1319—Boise, Idaho—Sealed bids will be received until 2 p.m., Sept. 1, for furnishing the Idaho Soldiers' Home and the State Penitentiary with their annual fuel requirements during the ensuing year. The coal for the Soldiers' Home is to be Aberdeen, Castlegate or an equally high grade product; for the penitentiary 24 carloads of slack coal and four tons of nut will be required. Address Secy. Geo. R. Barker, Capitol Bldg., Boise, Idaho.

✚1320—Hamilton, Ohio—Sealed bids will be received until 10 a.m., Sept. 1, for furnishing the County Government with 600 tons of 3-in. West Virginia screened lump, 300 tons to be delivered f.o.b. cars at Hamilton during the month of September, and the balance to be delivered in the basement of the Court House during the same period. Address County Audr. W. W. Crawford, Hamilton, Ohio.

✚1321—Plymouth, Ind.—The Board of County Commissioners will receive bids until Sept. 7, for furnishing 280 tons of Pocahontas egg coal. Address County Audr. G. F. McCoy, Plymouth, Ind.

✚1322—Brownstown, Ind.—The Board of County Commissioners will receive bids until Sept. 7 for furnishing coal as may be required during the ensuing year. Address County Audr. Albert Luedtke, Brownstown, Ind.

✚1323—New York, N. Y.—The army engineers at this place will receive bids until noon, Sept. 24, for furnishing and trimming into the United States dredges in New York Harbor from 9000 to 25,000 tons of bituminous coal. The contract is to run over the period ending Sept. 30 of next year. For the list of bids on this business last year see contract No. 16, Vol. 6, p. 854. Address United States Engineer Office, Room 707, Army Bldg., 39 Whitehall St., New York City.

✚1324—Port Engles, Wash.—The School District No. 7 will receive bids until Sept. 1, for furnishing 100 tons of coal to be delivered to the new central building. Address Clk. Madge H. Nailor, Dist. No. 7, New Engles, Wash.

✚1325—Canton, Ohio—The Stark County Board of Commissioners will receive bids until 10 a.m., Aug. 30, for furnshing approximately 1500 tons of lump mine-run and slack coal. Quotations should be made f.o.b. Canton, Ohio. Address Board of Commissioners, Stark County, Canton, Ohio.

✚1326—Dalton, Ohio—Sealed bids will be received until 6 p.m., Aug. 28, for furnishing and delivering coal to the subdistricts of Sugarcreek township during the period ending Jan. 1, 1916. About 70 tons will be required altogether. Address Clk. Clayton L. Arnold, Bd. of County Comrs., Dalton, Ohio.

1327—Panama, C. Z.—The Panama R.R. Co. will receive bids until noon, Sept. 3, for furnishing their coal requirements during the twelve months ending Sept. 15, 1916. The estimated tonnage involved is between 500,000 and 600,000, although no quantity is actually guaranteed. For data in regard to previous letting of this contract, see "Coal Age," Vol. 6, pp. 814, 854. On the current contract it is provided that the best quality, steaming, semibituminous mine-run coal only is desired. When coal is delivered on cars alongside of steamer, 65% of it must pass over a ¾-in. square opening and at least 30% must pass over a 3-in. bar screen. It must not contain over 3% moisture in the delivered coal, 6½% ash in the dry coal, 21% volatile matter or 1% sulphur, and must contain at least 72½%, fixed carbon, and have a B.t.u. value of 14,700 on dry coal. All bids must be accompanied by a certified chack for $1000 and the successful bidder will be required to submit a bond in the sum of not more than $30,000. Bids on a portion of the tonnage only will be received and considered. There is a provision in the specifications by which bonuses will be given for coal exceeding the requirements as to analysis and also whereby the railroad may at its own discretion accept inferior quality by making a proportionate reduction. Address Asst. Pur. Officer, R. E. Rutherford, Panama Railroad Co., 24 State St., New York City.

✚1328—Jacksonville, Fla.—The County Commissioners will receive bids until 2 p.m., Sept. 4, for furnishing 3-in. screened lump coal as may be required during the ensuing year. The successful bidder will be required to give a bond guaranteeing the faithful performance of the contract. Address County Clk. C. A. Boruff, Jacksonville, Fla.

✚1329—Plainview, Neb.—The School Board of Dist. No. 5 will receive bids until Sept. 1, for furnishing lump and nut coal as may be required during the ensuing year. Address Secy. F. C. Holbert, School Bd. Dist. No. 5, Plainview, Neb.

✚1330—Sentinel Butte, N. D.—The Board of Directors of the Sentinel Butte School Dist. No. 2, will receive bids until noon, Sept. 1, for furnishing and delivering 100 tons or more of lignite coal to the local school as may be required during the ensuing year. Address Clk. John Gilbertson, Sentinel Butte School Dist. No. 2, Sentinel Butte, N. D.

✚1331—Fairpoint, Ohio—The Board of Education of Wheeling Township will receive bids until noon, Sept. 3, for furnishing coal as may be required to the various schools, deliveries to be completed before Oct. 15 of the current year. Address Clk. Addison Saffell, Bd. of Edu., Fairpoint, Ohio.

Contracts Awarded

Note—Successful bidders are noted in **bold face** type.

✚No. 787—Springfield, Ohio—This contract (Vol. 7, p. 1005), which provides for furnishing the Hospital Board with coal, has been awarded the **Beckley & Myers Co.,** at $2.60 per ton for West Virginia bituminous mine-run. About 25 carloads will be required. Other bids on this contract were: Springfield Coal & Ice Co., $2.45; Grube Coal Co., $2.45 and $2.60, the latter bid being on Red Jacket coal. Address Clk. William H. Mahoney, Board of Hospitals, Room 2, City Bldg., Springfield, Ohio.

No. 856—Kansas City, Mo.—Additional information regarding the awards on this contract (Vol. 7, p. 1085, Vol. 8, pp. 40, 158) has been received as follows: **J. T. Wellington** will furnish 3900 tons of Cherokee lump bituminous at $3.54 per ton and the **Sweeney Coal Co.**, 2900 tons of semianthracite at $5.20 per ton. On last year's business the bituminous cost $3.54 and the semianthracite $5.34. Address Pur. Agt. F. S. Casey, Bd. of Edu., Kansas City, Mo.

No. 885—Detroit, Mich.—This contract (Vol. 7, p. 1086), which provides for furnishing the Lighthouse Department with coal during the fiscal year ending June 30, 1916, has been awarded on the following basis: DETROIT DEPOT including light stations in lower end of Eleventh U. S. Lighthouse District was awarded to **J. & T. Hurley**, Detroit, who bid $3.50 on three-quarter lump trimmed in bunkers or forked and bagged and $8 on anthracite, the total estimated amount aggregating $15,000; the United Fuel & Supply Co. bid $3.48 in bunkers, forked and bagged at $3.64, anthracite stove $7.69 and chestnut $7.94. The contract for the DULUTH DEPOT was awarded to the **Northwestern Fuel Co.** at $3.97 for three-quarter lump trimmed in bunkers, $4.53 forked in bags, $8.79 for anthracite chestnut and $8.51 for egg and stove; the Pittsburgh Coal Co., bid $3.97 for three-quarter lump trimmed in bunkers, $4.53 forked in bags, $9.07 for anthracite chestnut and $8.79 for egg and stove. The contract for the SAULT STE. MARIE district was awarded to **George Kemp**, at $3.30 for three-quarter lump trimmed in bunkers, $3.60 forked in bags and $7.40 for anthracite in bags, all delivered at the Lighthouse depot, Sault Ste. Marie; the Perry Coal Co. bid on this same business $3.35 for three-quarter lump trimmed in bunkers, $3.70 forked in bags and $7.90 for anthracite in bags. The **C. Reiss Coal Co.** was awarded the contract for the ASHLAND, WIS., DEPOT at $4 for three-quarter lump trimmed in bunkers, $4.40 forked in bags and $8.80 for anthracite egg and stove size. Address Inspector Edward L. Woodruff, Eleventh Lighthouse District, Detroit, Mich.

+No. 892—Jacksonville, Fla.—This contract (Vol. 7, p. 1086, Vol. 8, p. 76), which provides for furnishing the U. S. Engineers' Office at this place with 5500 tons of coal, was awarded to the **Logan Coal & Supply Co.**, and the **Tampa Coal Co.** The former bid, $4.42 per ton for 4000 tons and the latter $5.75 for 1500 tons. Address, District Engineers' Office, P. O. Drawer 45, Jacksonville, Fla.

No. 984—Kansas City, Mo.—This contract (p. 41), which provides for furnishing Smith & Sons Manufacturing Co. at this place with coal during the ensuing year, has been awarded to the **Gray-Bryan Sweeney Coal Co.** While the price at which the business was done is not available, it is understood to have been less than last year. Address S. F. Smith, Lydia & Guinotte Aves., Kansas City, Mo.

+1034—Youngstown, Ohio—This contract (pp. 115, 243), which provides for furnishing the Local Board of Education with approximately 5000 tons of coal, has been awarded to the **Crystal Ice Co.**, at $2.70 per ton for 1½-in. lump, $2.50 per ton for nut and $1.75 per ton for slack. Address Dir. W. N. Ashbaugh, Bd. of Edu., School Dist. No. 20, W. Wood St., Youngstown, Ohio.

+1058—Plymouth, Mass.—This contract (pp. 116, 283), which provides for furnishing the county commissioners with 400 tons of egg and 100 tons of a high-grade bituminous coal has been awarded to the **E. P. Reed Lumber Co.**, of North Abington, who bid $6.40@6.60 on Lehigh egg coal and $4.95 on Pocahontas. Address, County Com. Lyman P. Thomas, Plymouth, Mass.

+1065—Kansas City, Kan.—This contract (p. 116), which provides for furnishing the Board of Education with 90,000 bu. of Cherokee lump, and 1000 bu. of slack coal have been awarded to the **Buchan Coal Co.**, of this city, at $3.25 for lump, and $3 for slack coal. The prices are slightly under the figures of last year. Address Pur. Agt. L. Friedman, Bd. of Edu., Kansas City, Kan.

+1068—New York, N. Y.—This contract (pp. 117, 243, 283, 323), which provides for furnishing the Department of Docks and Ferries with approximately 1500 tons of egg coal, has been awarded to **Pattison & Bowns**, at $5.33 per ton. Address Dock Com. R. A. C. Smith, Pier A, North River, New York.

1088—New York, N. Y.—Additional details regarding the award of this contract (pp. 117, 198, 325), which provides for furnishing the Department of Bridges with 250 gross tons of No. 1 buckwheat and 250 gross tons of mine-run bituminous, have been received as follows: As previously noted the contract was awarded to **Burns Brothers**, and was dated July 30, the consideration being $3.25 on the buckwheat and $3.30 per ton on the bituminous. Address Comr. F. J. H. Hracke, Municipal Bldg., New York City.

Contract Notes

Pennsylvania R.R.—Press reports are to the effect that the Pennsylvania R.R. is stocking coal heavily.

Chippewa Falls, Wis.—The contract to furnish the city with its winter's supply of coal was awarded to the **Clark Grain & Fuel Co.**

Valparaiso, Ind.—The Board of County Commissioners let the contract for 200 tons of Pocahontas coal to **M. Coash**, of this city, at $4.95 a ton.

Goshen, Ind.—The bids received by the Board of County Commissioners for coal for county uses next year were not satisfactory and new bids will probably be asked at the September meeting of the Board.

Cambridge, Ohio—The Board of Control has awarded the contract for furnishing coal for the city power and light house to the Puritan Coal Co. at $1.19½c. for run-of-mine and $1.29½ for three-quarter-inch coal. The National Coal Co. bid $1.20 for mine-run and $1.30 for three-quarter inch.

Bear Creek, Mont.—The Interstate Commerce Commission, acting on a complaint filed by the Bear Creek Coal Co., has ordered the railroad rate on screenings from Bear Creek, Mont., to Metaline Falls, Wash., reduced from $4.25 to $3.75 per ton. The screenings are used at Metaline Falls in the manufacture of cement.

Baltimore & Ohio R.R.—The Baltimore & Ohio R.R. has awarded its annual coal contracts. About twenty-five firms, whose names were withheld by the road, but with mines located along its lines, received awards which totaled 6,000,000 tons for delivery over the next twelve months. The Consolidation, New England Coal & Coke and Quemahoning Coal concerns are understood to have figured largely in the awards.

Hazleton, Penn.—It has been noticed that all of the large anthracite companies who have storage yards are filling them to their capacity at this time, with a possibility of a suspension in view. For some weeks past the Lehigh Valley R.R. has been placing large quantities of engine fuel in their storage plant at Hudsondale, and all of the other railroads seem to be taking the same precaution.

Oklahoma City, Okla.—Contract to furnish coal for Oklahoma City schools has been awarded the **M. B. Schofield Co.** of Oklahoma City, which agreed to furnish 700 tons of semianthracite at $3.35 per ton, for the high school and 2000 tons or more of Dewar coal at $3.75 per ton for the ward schools. Enforcement of this contract by the Board of Education has been enjoined on the application of Dr. L. Haynes Buxton, alleging a lower bid was submitted by Mgr. C. C. Buxton of the Garrison Coal Co., Oklahoma City.

Columbus, Ohio—No legal action has yet been taken in an attempt to abrogate the contract (p. 286), entered into by the trustees of the Ohio State University with the Lorain Coal & Dock Co. to supply the university with 15,000 tons of coal from the Logan County, W. Va., mine. The news of the award of the contract has raised a storm of protest because of the campaign which has been started to "use Ohio-mined coal." It may be that some steps will be taken to abrogate the contract but the method to be followed has not been outlined as yet.

St. Marys, Ohio—The contract for furnishing the electric light plant with coal during the ensuing year has been awarded to the **Avon Coal Co.** at 72½c. per ton for mine-run coal. The following is a complete list of bids submitted:

COAL BIDS RECEIVED JULY 21, 1915

Bidder	Nut and Slack	Mine-Run
The Chesapeake & Ohio Coal Co.	....	$0.75
West Virginia Pocahontas Coal Sales Co	$0.70	.87
The Carbon Fuel Co	.75	.85
The Reliance Coal & Coke Co	.64[1]	.87
The Colonial Coal & Supply Co	....	.80
The Black Diamond Coal Co	....	.97½
Kentucky Fuel Co. (no bond)	.75[2]	.60
Victoria Coal Co (no bond)	.45[3]	.80[4]
The Lorain Coal & Dock Co	.60	.80
The Seidenfeld-Hammond Coal Co.	....	.95
Hatton, Brown & Co	.75	.95

COAL AGE

Vol. 8 NEW YORK, SEPTEMBER 4, 1915 No. 10

Dust and its Allayment

Research has proved that every space in the universe is pervaded with dust of some sort. Cosmical dust is known to be continually falling upon the earth. A rift in the clouds shows a bar of sunshine and dust or vapor. A hole in the shutter admits a peep of sunshine and reveals a streak of dust. The atmosphere of machine shops where quantities of cast iron are being turned is pervaded with iron dust which sparkles in the gaslight, but is not otherwise visible. The dust of flour mills is also invisible or unnoticeable, but it is there all the same, and explodes under certain conditions.

The atmosphere of coal mines is notoriously addicted to dust, and to explosions attributable thereto. All explosions in mines are not traceable to coal dust; some are caused by gas, or by gas and dust combined.

The circulation of air necessary for proper ventilation compels also a circulation of dust which may accumulate in spots to such density as to become explosive. The admixture of gas may determine the explosive point. Anyway explosions occur, and it is not always known which is the detonating medium.

Increased ventilation would seem to be the rational remedy. But on the other hand increased currents of air stir up and circulate the dust in greater quantity. Spraying is recommended and practiced in some mines, but when plain water is used it soon dries and the dust becomes as bad as ever.

At the risk of "butting in," I would recommend a spray composed of fire clay dissolved in water to a consistency of milk, and applied by a barrel sprayer on a truck or coal car, which can be moved around wherever tracks are laid. Such a mixture would seal the dust to the walls, or precipitate it to the floor; and incidentally the spraying operation would pick up and concentrate much of the floating dust. If this were thoroughly done and kept well up to the workings the danger from dust would be lessened, and the ventilation would do the rest —perhaps.

It would be expensive to whitewash the whole interior of a mine; but so is an explosion, and of the two evils the lesser should be chosen.

Straight Line Ventilation

The experienced mine foreman, or superintendent, is probably the highest authority on the distribution of air in mines. Every miner and operator knows how disagreeable it is to work in a swiftly moving current of air. Therefore, the flow of air at the working faces should be as moderate as is commensurate with safety and health. But in a practical consideration the air must be forced with sufficient velocity and tension to carry it to the furthermost working point. Consequently the main lines of ventilation should be straight and direct, and the distribution conducted at right angles from the main, or possibly in a reverse direction.

In such a condition as this it would require less power to circulate a given quantity of air than in mines where the air courses run zigzag at numerous angles regardless of proper distribution. It is well known that a few right-angle turns knock the life out of a current of air, unless it has a powerful force behind it, hence the advantage in straight lines. The same rule applies to water in pipe lines.

It is frequently noted that some fans do not deliver half the amount of air for which they are rated. Others of identical construction, under favorable conditions deliver their rated capacity.

The roughness or unevenness of the walls mean much, but the main cause of the difference in fan deliveries is the indirect air courses.

The present fashion in higher speed fans is given the credit (to which they are entitled), for improved ventilation, but no credit is accorded the present better distribution of air. Mines are better planned and arranged now than formerly, and hence the ventilation improves year by year.

It is well known that all fans are not equally efficient. One of the most lauded ones at the last Paris Exposition would not blow a man's hat off, when in the direct current and with the fan at full speed. Yet this same fan has been copied in this country.

Actions speak louder than printer's ink, but printer's ink in some cases is the lubricant most used. It is not always the best, however.

By C. W. CRAWFORD

Uses for Underground Fans

By Henry Briggs*

SYNOPSIS—Underground fans may be used for main ventilation, for boosting or merely for cooling purposes. When used as the mainstays in ventilation, they permit the outside standby fan to be protected by doors and so increase safety. However, if they are electrically driven they introduce the dangers inherent in the use of that power.

Underground fans are already a familiar feature of British mining. They are being used, (1) as main ventilators, responsible for the whole ventilating current; (2) as auxiliary ventilators, otherwise known as "booster" fans, assisting the work of the surface fan in ventilating certain sections of a mine; and (3) as "closed-circuit" ventilators, whose purpose is to create a more rapid flow of air in specially hot parts of a mine.

In this last application the underground fan, which is usually small, does not add to the volume of air passing through the mine; it merely induces a closed circulation of air within the workings. The quicker local flow is, however, beneficial to workers in hot places.

UNDERGROUND FANS AS MAIN VENTILATORS

Not many mines go so far as to use underground fans as main ventilators. When they are so applied, a surface fan must be installed of a capacity sufficient to ventilate the whole mine in case of a disaster to the underground machines. The standby fan at the surface must also be arranged to allow of the air being reversed, provision for such reversal being compulsory in British collieries. Rare though it be, the utilization of underground fans as main ventilators has much in its favor, especially where several seams are being worked from the same pair of shafts.

Instead of adjusting the flow into the various seams by artificially impeding the current in the shorter and more greedy sections by means of regulators—the only method possible when one fan at the surface serves them all—regulation in the newer method can be provided by the adjustment of the speeds of the fans in the different seams or districts. The result is that to circulate given quantities of air in each of the sections less power is absorbed by several fans working in parallel than by a single surface fan.

The provision of a standby fan at the surface removes much of the weight of the objection that underground fans may be destroyed by an explosion. The question is, however, one worth examining a little further. When the regular ventilation of a mine is entirely produced by fans below ground, both the shaft mouths are normally open, and the standby is completely shut off from the mine by one or more steel doors.

If a large explosion were to take place, we must assume, to be on the right side, that every fan underground would become unworkable; yet the open shaft mouth and the protection of the steel doors render it less likely that the surface fan would be damaged than if it were in operation as the main ventilator. Hence it is permissible to conclude that the reëstablishment of the air current after an explosion would actually be easier when underground fans generate the entire normal air current.

BOOSTER FANS TO ASSIST MAIN VENTILATOR

The chief use of the underground fan at present is, however, as a booster, running "in series" with the main ventilator at the surface and assisting the latter in airing some section which requires an abnormal air supply or possesses abnormal resistance.

Disappointment has sometimes been expressed at the performance of an underground fan working in series with one at the surface, owing to the comparatively small increase in air volume resulting from that combination. The late Walton Brown was, I believe, the first to show that such a result was strictly in accord with theory. His analysis of the problem will bear repetition:

Let Q_1 and h_1 be respectively the yield in cubic feet per minute and the water gage generated by the main fan when running alone; and Q_2 and h_2 the equivalent yield and water gage for the underground fan also when working alone. Also let Q and h represent the yield and gage when the two fans work together and in series.

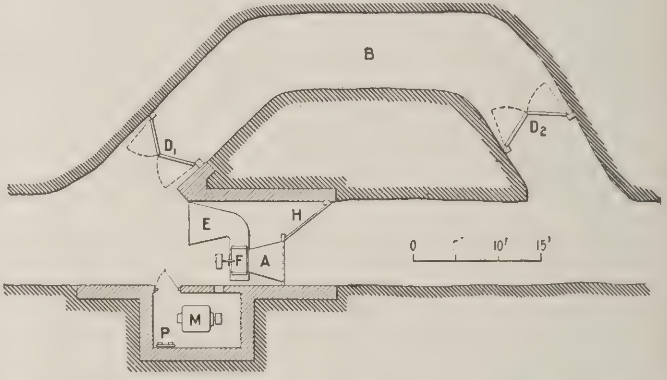

FIG. 1. ARRANGEMENT OF SIROCCO FAN AND MOTOR

The useful work done in moving air when the main fan runs alone is 5.2 $h_1 Q_1$ ft.-lb. per min., and when the underground fan works alone, 5.2 $h_2 Q_2$ ft.-lb. per min.

When the two operate together, the total useful work done will be 5.2 $(h_1 Q_1 + h_2 Q_2)$, and this, otherwise expressed, is 5.2 $h\,Q$.

Therefore

$$h\,Q = h_1 Q_1 + h_2 Q_2 \qquad (1)$$

But as the air circuit remains very nearly unchanged in character, whether the main fan of the auxiliary work alone or the two run together, the water gage is, by Atkinson's rule, proportional to the square of the volume of air, or

$$\frac{h}{Q^2} = \frac{h_1}{Q_1^2} = \frac{h_2}{Q_2^2} = a\ constant \qquad (2)$$

Now equation (1) may be rewritten

$$\frac{hQ^3}{Q^2} = \frac{h_1 Q_1^3}{Q_1^2} + \frac{h_2 Q_2^3}{Q_2^2}$$

---

*Professor Mining Department, Heriot Watt College, Edinburgh, Scotland.

and dividing through by the constant of equation (2) we obtain

$$Q^3 = Q^3_1 + Q^3_2 \qquad (3)$$

In practice the surface fan is the more powerful; that is, Q_1 is greater than Q_2. Even if the fans were to be made of equal power, making $Q_2 = Q_1$, the last equation would resolve into

$$Q = Q_1 \sqrt[3]{2} = 1.26\, Q_1$$

and the increase in air volume obtained would be only 26 per cent. of that of either fan running alone. It follows, therefore, that the quantity-increment due to placing one fan in series with another can never exceed 26 per cent. of the capacity of the more powerful of the two fans running alone.

We may take the investigation a step further than Walton Brown. By eliminating the quantity-factors between equations (1) and (2) we get a relation connecting the water-gages; namely,

$$h^{\frac{3}{2}} = h_1^{\frac{3}{2}} + h_2^{\frac{3}{2}} \qquad (4)$$

If the two fans were identical, h_1 would equal h_2, and equation (4) would become

$$h = h_1 \sqrt[3]{4} = 1.59\, h_1.$$

Hence it will be seen that the gage-increment due to placing two fans in series cannot exceed 59 per cent. of the gage-pressure generated by the stronger of the two working alone.

Experiment has well established the fact that the yield of a fan is directly proportional to its rate of revolution. This is a useful rule for the case we are discussing; for when the section of the mine served by the auxiliary fan becomes more extensive, it is necessary to meet the additional resistance or the additional demand for air by augmenting the speed of the fan.

The question then is, What increase of speed is required to bring about a given increase in air volume? Letting n_2 r.p.m. represent the required increased speed of the auxiliary fan and n_1 r.p.m. its speed when if operating alone it would circulate Q_2 cu.ft. of air per minute. By the rule stated, the auxiliary working alone at n_2 r.p.m. would produce $\frac{n_2}{n_1} Q_2$ cu.ft. of air per minute. Substituting into equation (3)

$$Q^3 = Q_1^3 + \left(\frac{n_2}{n_1} Q_2\right)^3 \qquad (5)$$

From this relation may be calculated the speed n_2 of the auxiliary so as to give a desired air-volume, Q, when the two fans run together.

METHODS OF INSTALLATION

Fans of the propeller type are rarely used in British colliery practice, although for setting in an underground roadway they have the advantage of giving a straight-line path for the air. Quick-running single-inlet centrifugal fans of the Sirocco class are most generally used in service below ground. Intakes being used for haulage, the fans are usually placed on the returns where they are out of the way of the traffic. Fig. 1 shows one such arrangement, the 40-in. single inlet fan *F* being driven by a belt from the motor *M*. Any required alteration of the speed of the fan is effected by changing the size of the pulley on the fan shaft.

The fan station must be well protected. In the case illustrated, the roof is supported by steel girders resting on side walls. The pass-by *B* is an essential provision, being needed by officials and others traveling the road, and is used when timber has to be taken past the fan or repairs made in the vicinity. The doors D_1 and D_2 are hung so that when *F* is running the pressure will keep them shut, yet should the fan stop for any reason, the doors will open by the suction of the main fan at the surface.

The partition *H* is of 1-in. tongued-and-grooved boarding, made so light as to act, with the doors, as a safety valve were an explosion to take place, the aim being to safeguard the fan itself as much as possible. By this arrangement, it will be noticed, it is necessary to turn the air, in passing through the fan, through an extra right-angle to gain the horizontal *évasé E*. Every such bend means of course some waste of power.

This difficulty is avoided by the arrangement illustrated in Fig. 2. This method of installation is convenient when the fan is placed in connection with an intake haulage road, allowing, as it does, of a straight-through passage for the haulage. When an underground fan is connected to a haulage road, doors unfortunately cannot be avoided.

PREFERABLE DRIVING POWER

Although power derived from falling water has been applied to small underground fans, ventilating "ends" in metalliferous mines, from a very early date, only two kinds of power—namely, electricity and compressed air—need be considered in discussing the modern application of these fans to collieries. If all the underground machinery at a mine is driven by compressed air, there is nothing more to be said; for any fan installed in the mine will naturally be similarly driven. But if the general power supply is electric, it is another matter.

One advantage of placing the fan on the intake is that an electrical drive is permissible. To run a fan on a return in airway in a gassy pit, however, and to drive it electrically when the motor room is ventilated by return air, is obviously impossible. It is risky even when the gas-content of the return air is normally well below 1 per cent. and when the motor and switch-gear are suitably protected.

Where safety is the paramount issue, we must reckon with the abnormal condition rather than with the usual. Gas may collect in dangerous amount through a temporary breakdown of the fan itself. In Great Britain the Mines Act requires the stoppage of electrical machinery should the firedamp content reach 1¼ per cent. Thus it might happen that a fan so driven would have to be stopped, to comply with the act, at the very time when it was most needed.

A successful way of circumventing this difficulty is to construct the motor room on the return, but at the end of a crosscut connecting with the intake, and to ventilate the place with fresh air carried in by a pipe. The end of the air pipe can conveniently be fitted with a shutter so that the air supply is under control. Should such a method be adopted, care must be taken to arrange matters so that every opening from the return to the motor room is on the inlet side of the fan, or else it would probably be found that, owing to the elevation of pressure caused by the fan, the air in the pipe ran in the opposite direction to that which is desired. The arrangement shown in Fig. 1, for example, would be faulty if the motor room were intended to be separately ventilated with intake air, for the openings to the room are all on the delivery side of the fan.

Another way of meeting the problem of driving a fan in the return of an electrically equipped colliery is to employ an electrically driven compressor in a neighboring intake and to lead the compressed air so generated to an engine working the fan. It is outside the scope of this article to discuss at all fully the pros and cons of inby compression. When it is adopted by mine superintendents it is not usually because they like it, but because there is no other solution. It means increased first cost, greater costs of operation, more trouble, and roughly twice the risk of breakdown to the fan or other machine which is being driven.

Negative Water Gage and Its Effects

I have just said that underground fans may cause a flow of air from a return back into an intake. This is owing to the fan heaping up pressure on its delivery side. Thus a water-gage reading taken between a point on the delivery side of an underground fan and a point in an intake close by may be negative. Hence, if doors were left open in a road connecting two such points, a closed air circuit would be set up and the intake would be flooded with return air. Moreover, the direction of leakage through stoppings or through the waste in such a neighborhood opposes the usual direction.

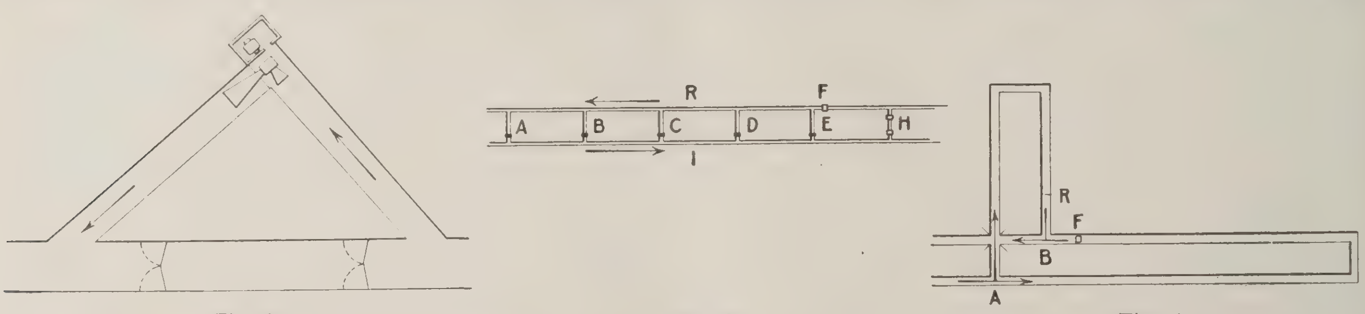

Fig. 2 Fig. 3 Fig. 4

FIGS. 2 TO 4. ILLUSTRATING SOME DIFFICULTIES ARISING IN THE OPERATION OF BOOSTER FANS

When Prof. J. Cadman, of Birmingham University, England, was investigating the ventilation of coal mines on behalf of the British Royal Commission on Mines (Government Bluebook, Cd. 4551, p. 9), he found just such an instance. A 40-in. Sirocco fan was in use on a return inby. A main intake in its vicinity was found to be considerably contaminated with return air, which made its way from the return at an air crossing and through certain stoppings and doors. Cadman measured the difference of pressure between the intake and return at a point close to the fan discharge. He got a negative water gage of $3\frac{1}{2}$ in. The return air near the fan contained 10 per cent. of blackdamp and $\frac{1}{2}$ per cent. of firedamp—"a very undesirable mixture to leak into the intake," as Cadman correctly remarked.

With an arrangement of roads similar to Fig. 3, it is evident, then, that special care must be taken to prevent leakage from the return *R* to the intake *I*. If it is considered necessary to have doors in one of the crosscuts, they should be placed at *H*, on the inlet side of the fan, rather than at *D* or *E*. The brick stoppings in the connections *E*, *D*, *C*, etc., should be well-built, recessed into the sides and coated over on their intake faces with mortar. Fine rubbish should also be banked up solid for 5 or 6 yd. behind each of them.

If there is an excess of pressure in the return at *E*, that excess will be less at *D* and less still at *C*. So that as we travel outby we shall sooner or later reach a neutral point, where there is a zero water gage. It is useful, even at some trouble, to find the whereabouts of that neutral point, by actual trial, in order to ascertain the extent of the zone over which special precautions against leakage must be taken.

Effect on Other Splits of Air

Fig. 4 shows diagrammatically two air splits of different lengths. Before the auxiliary fan was put in at *F*, the splits obtained an air supply depending in each case on the difference of pressure between the points *A* and *B*; and to increase the resistance of the shorter split and to prevent it taking more than its share of air, a regulator was placed at *R*. When the fan started to run, it created an increase of pressure at *B* and therefore a smaller difference of pressure between *A* and *B*, and the flow of air into the shorter split was checked. The larger split got an increased volume of air, it is true, but at the expense of a decreased supply to the shorter split.

This is exactly what was found to have happened when the late Walton Brown tested the ventilation of the Browney Colliery Co., Durham, England, after a Schiele fan had been installed underground to help the ventilation in one of the seams. His measurements showed that the air supply to the other seams worked from the same shafts had suffered a diminution (see *Transactions* of the Institute of Mining Engineers, Vol. XXXIV).

Now an influence of this character may not be harmful if small in magnitude, for it may be found possible—glancing once more at Fig. 4—to compensate for it by opening the regulator *R*; but if the fan is stationed close to *B*, that point may actually be within the zone of negative water gage. In that case the flow in the shorter split would be reversed and a closed-circuit current set up round the two districts.

A study of the underground fan therefore reveals that, useful though that machine may often be, it introduces a number of special problems and places some new difficulties on the shoulders of those responsible for the control and supervision of the ventilation of the mine.

⁂

At the Working-Faces, unless the coal is unusually brittle, there is not, generally speaking, sufficient dust to initiate an explosion. The dangerous accumulations of coal dust are almost exclusively confined to the main haulageways, and Professor William Galloway cites as the three main sources of dust: (1) Coal falling from mine cars which is ground by degrees into the form of dust by the traffic and carried by eddies and currents of air along the roadways. (2) Dust blown off the coal contained in the wagons during their transit from the working-places to the hoisting shafts. (3) Dust from the screens that is carried down the downcast in the descending air current.

New Style of Coke Ovens

Throughout the country the attention of coke manufacturers and others interested in coke or byproducts of coal is turned toward Chattanooga, Tenn., where the first Roberts coke ovens erected are being operated by the Chattanooga Gas & Coal Products Co.

The inventor claims that from the standpoint of quick conversion of coal into coke these ovens will prove more efficient than any other type used in this country or even in Germany, where the art of coking coal is conceded to be the highest attained, economy and expeditious work considered.

If Mr. Roberts' design proves successful, gas and coke manufacturers expect it to revolutionize the coke industry in this country, and numerous visits are expected from Northern manufacturers.

Heat was started on the ovens—for the Roberts ovens are fired from the top in a way never attempted before—about June 1, and it was fully 30 days later that a sufficiently high temperature was reached to permit coking.

CHATTANOOGA GAS & COAL PRODUCTS CO.'S PLANT

A perpetual-motion process of operation is incorporated in the Roberts ovens; that is, each charge of coal is carbonized by the burning of gas generated by former charges. This made it necessary for the Chattanooga Gas & Coal Products Co. to contract with the Chattanooga Gas Co. for the purchase of gas to bring the ovens to their first heat.

Use of Powdered Coal as Fuel

At the seventh annual convention of the International Railway Fuel Association, W. L. Robinson, supervisor of fuel consumption of the Baltimore & Ohio R.R., presented a paper outlining the advantages that might result from the use of powdered coal in locomotive furnaces, and from this article the following costs of pulverizing are taken.

The cost of preparing powdered coal will vary with the cost and moisture content of the raw coal. However, a general average from available data covering periods of the past five to ten years at cement and metallurgical plants has made it possible to present a conservative estimate, assuming the cost of the raw coal at from $1 to $2 per short ton, and that it will require crushing and have a moisture content of from 5 to 10 per cent. when placed in the drier. The plant capacity is given in short tons per 10-hr. day and the cost given covers all the items of expense in the preparation of a short ton:

Capacity	Cost	Capacity	Cost
20	25 to 50c.	50	14 to 35c.
30	20 to 45c.	100	12 to 30c.
40	16 to 40c.	250	10 to 20c.

The fuel required for drying the coal will average from 1 to 2% of the coal dried. The total cost is distributed approximately as follows:

Fuel for drying	10%
Power for operation	30%
Labor	30%
Maintenance and supplies	25%
Interest, taxes, insurance and depreciation	5%
Total	100%

The cost of preparing powdered coal should be more than offset by the ability to utilize mine refuse and sweepings, run-of-mine, screenings and slack grades of coal that cannot be used to advantage otherwise, and inferior grades of sub-bituminous coals, lignite and peat of relatively lower cost per ton than the readily salable commercial fuels.

To feed the coal into the furnace in a finely divided or powdered state is the most advanced method of producing perfect combustion. While a cubic inch of solid coal exposes only 6 sq.in. for absorption and liberation of heat, a cubic inch of powdered coal exposes from 20 to 25 sq.ft., which makes possible a more uniform gas production from the volatile matter in the coal and more prompt and perfect intermingling of gas and air, thereby improving combustion and reducing smoke. Furthermore, there is no cooling of the fire by heavy intermittent charges of fresh coal, as is the case with hand or stoker firing on grates.

Powdered coal may be burned by either of two generally defined methods—the long-flame method, constituting a progressive burning of the coal such as is employed in cement and openhearth furnaces, and the short-flame method, which is the latest development and is used in metallurgical and similar metal-heating work or under boilers where a similar furnace volume obtains.

Variable-Speed A.-C. Motors for Driving Mine Fans

By F. B. Crosby*

SYNOPSIS—Means of changing the speed and consequently the capacity or water gage of mine fans are highly desirable if power is to be conserved. Heretofore alternating-current motors driving mine fans have been mostly of the single- or double-speed induction type. A variety is now available, however, that may be readily and easily adjusted through a considerable range of speed and which possesses meanwhile efficiency characteristics at least as good as those of the induction motor.

With the increasing complexity of industrial society, intelligent provisions must be made for the artificial maintenance of those conditions necessary to life which in the open are amply provided by nature. Generally speaking, impure water and vitiated atmosphere are more likely to be encountered in the vicinity of human habitation than elsewhere; particularly is this true as the variety and magnitude of industrial activity increase.

The continuous supply of properly diluted oxygen of the requisite humidity for public buildings, hotels, theaters, offices, factories, etc., as well as for subways, tunnels and mines is at last receiving a much-deserved attention. The humanitarian and economic advantages of substituting normal and healthful for abnormal and injurious conditions are beginning to be appreciated.

In its simplest terms ventilation is merely the exhausting of depleted air from and the blowing of fresh air into a confined space. The details of design of suitable devices for moving the air in such a manner as to obtain the pressure and volume required at a given point remote from the source of supply, with a minimum expenditure of energy, as well as the problem of most efficiently distributing this energy, are beyond the scope of these remarks, which must be confined chiefly to certain typical requirements for underground ventilation, together with the several systems of control which have been developed to meet such requirements. Two general conditions must be considered:

A. Those requiring approximately constant pressure or volume, such as tunnels, and subways of fixed dimensions and resistance.

B. Those in which the volume or pressure, one or both, must be varied frequently because of one or more of the following reasons: Increasing length and resistance of airways; economy in power consumption during idle periods, nights or holidays; to meet emergency requirements for increased pressure because of airways blocked by falling rocks; a temporary increase in the working force; to clear the mine of powder smoke or to sweep excess gas from pockets, etc.

For Constant Conditions Use an Induction Motor

For condition A there is no question that a standard squirrel-cage induction motor direct-connected to a suitably designed fan affords the simplest sort of installation, possessing high efficiency together with minimum maintenance and operating charges.

A direct-current motor can of course be used equally well, but as compared with the squirrel-cage induction motor the direct-current machine is subject to the disadvantage of a less efficient distributing system, which is an important point when, as is usually the case with mine fans, the air shafts are far removed from the power house. The direct-connected motor is handicapped also by a somewhat more complex starting equipment, commutator and brushes, which are wearing parts and which are not present in the squirrel-cage type of motor. Furthermore, the direct-current motor cannot be guaranteed absolutely sparkless under all conditions. This in the presence of gas is a vital objection.

In applying squirrel-cage motors, however, especial care should be taken to ascertain whether such a motor will start and satisfactorily accelerate the fan to full speed. With modern fans of small diameter with small Wr^2 or flywheel effect this feature need hardly be considered, but for large diameter slow-speed belted fans the character of the torque curve of the squirrel-cage type of induction motor is such that even if a given motor has sufficient turning effort to start the fan from rest without prohibitive current from the line, the torque increases so rapidly near synchronism that the belt is liable to snap or jump off the pulley.

For such cases a motor with phase-wound rotor and secondary resistance should be used. This will permit a much higher starting torque and will also give much smoother acceleration.

In discussing the second group, B, it is only fair to say that among mine operators there are two opposing camps. The one makes sweeping claims that variable-speed motors are never required; that all necessary speed changes can be obtained by using belt drive and changing the diameters of the pulleys. The advocates of this policy will sometimes admit the desirability of a multispeed motor, that is one which has two or possibly three constant synchronous speeds depending upon the external connections for corresponding polar groupings.

The other side claims always an advantage for the variable-speed motor. In the writer's opinion neither is always right. Where conditions approximate A the constant-speed motor is desirable as it is efficient, cheap and simple. Most metal mines and some coal mines are practically free from gas, and in older workings, owing to opening new headings and closing old ones, the same resistance may remain nearly constant for long periods.

The power required to drive a fan usually varies somewhere between the cube and square of the speed; consequently a two-speed motor of the changeable-pole induction type if operated at half speed when the men are out of the mine will save considerable power. If operations are carried on the full 24 hours this feature loses weight. If conditions are such that the fan must be speeded up from time to time, but never in emergency, the changeable-pulley method will serve within obvious limits.

---

*General Electric Co., Schenectady, N. Y.

In advocating this method, however, the cost of extra pulleys, belts and larger fan house, the labor of changing pulleys (which of course can be done only when the men are out of the mines), as well as the inability to take care of the emergency requirements mentioned under B, must be borne in mind.

IN VENTILATION ALL PRECAUTIONS SEEM JUSTIFIED

Mining laws in many of the states are becoming more and more insistent on safety, the tendency being carried in some cases to absurd limits. In the matter of ventilation, however, all possible precaution seems fully justified, and to meet most satisfactorily the demand for absolute continuity of service at high efficiency under widely varying conditions of volume and pressure a variable-speed motor must be employed.

Until about three years ago it was necessary in such cases to resort to direct-current motors or motors of the phase-wound rotor induction type with variable external secondary resistance. The former is objectionable for the reasons mentioned. The induction motor with rheostatic control is chiefly objectionable because of its low efficiency at reduced speed.

The aggregate energy wasted in this manner throughout the country is enormous, as must be evident when the speed-torque characteristics of the induction motor are appreciated. There are in service today many large induction motors of capacities up to 1000 hp. driving mine fans, which have been in operation continuously with rheostatic control at from 30 per cent. to 50 per cent. speed reduction for periods of from 4 to 7 years. When operating at constant torque at reduced speed the input to an induction motor is practically constant and the secondary losses proportional to the reduction in speed.

If efficiency is plotted against speed and a straight line drawn from the point corresponding to full load efficiency and speed the efficiency for constant torque at any other speed may be read directly from the curve. With fan drives, since the horsepower varies roughly as the cube, and hence the torque as the square of the speed, the efficiency is still lower.

For very low speeds this may not prove serious from the standpoint of cost of energy, since though the efficiency is low the actual horsepower output is also low, but for ranges between 50 per cent. and 100 per cent. on large motors the excess cost of power over methods described below may easily amount to $2000 a year at the usual cost of power per kilowatt-hour.

In this connection it may be of interest to note that if

S = Slip in per cent. of synchronous r.p.m.,

$1 - S$ = Speed in per cent. of synchronous r.p.m.

Then regardless of whether the torque increases, decreases or remains constant as the speed is varied, the total secondary or slip energy of the motor dissipated as heat with rheostatic control is always equal to $\frac{S}{1-S}X$ shaft output expressed in horsepower or kilowatts.

The fact that an induction motor with rheostatic control has a series speed characteristic and tends to accelerate to synchronism when the load is thrown off is not usually a serious objection, since fan loads are ordinarily quite steady.

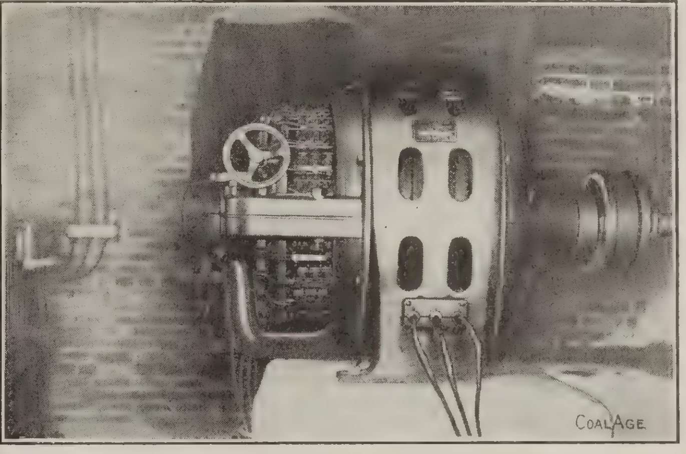
Much effort and expense were undertaken by electrical companies in the endeavor to devise an alternating-current motor or system of control for such machines which would have the desired high efficiency, high power factor with variable or adjustable speed characteristics. In the spring of 1912 the writer had the pleasure of describing before the mining section of the A. I. E. E. at Pittsburgh several possible methods of obtaining speed control for fan drives and particularly two methods which although at that time still experimental in this country had been successfully applied some years previous in Europe.

Since that time both these methods have been modified and developed to meet the demands of American practice and a considerable number of the type PCS (polyphase commutator brush-shifting) motors in capacities up to 150 hp. and also the so-called type PCR auxiliary speed-regulating sets for use with standard induction motors for driving mine fans up to 250-hp. capacity have been in continuous use for varying periods up to nearly two years. Each of these methods has proved successful, and is worthy of more consideration than can be here given.

CONSTRUCTION OF THE NEW TYPE OF MOTOR

The type PCS motor consists chiefly in a stationary part or stator with three-phase distributed winding similar to that of a standard induction motor. The rotor is similar to that of a standard direct-current motor, but is provided with a larger number of brushes so mounted that the entire supporting yoke can be rotated by means of a handwheel.

A FAN AND MOTOR HOUSE AT AULTMAN, PENN., CONTAINING A TYPE PCS MOTOR



A TYPE PCS MOTOR DRIVING A 100,000 CU.FT. FAN AT AULTMAN, PENN.

For convenience of design a series transformer is commonly used to supply current to the armature. A suitable oil switch with overload and low voltage features is usually combined with this transformer. The chief function of the transformer is to provide a low potential for commutation usually considerably less than 100 volts. This constitutes the entire control, which is by far the simplest ever devised for an electric motor excepting possibly the constant-speed squirrel-cage type of machine.

The motor is started, accelerated, stopped and reversed simply by shifting the brushes. This shifting is accomplished by means of worm gears and a handwheel conveniently mounted on the frame of the machine. If desired a small pilot motor can be used and the machine perfectly controlled from a remote point.

Since in effect the total number of ampere turns in the stator are equal to and in series with those of the rotor it is evident that with the brushes set in the same axis as the stator windings, the angle $a = 0$, and no field is produced by the line current. If the brushes are now shifted through an angle a, the balance between rotor and stator windings no longer exists, and the resultant ampere turns produce an excitation proportional to the current in both windings and to the angle of brush shift. The motor, therefore, will develop a torque proportional to the square of the line current and the angle of brush shift.

If the angle of brush shift is 180 deg., no torque is developed, since the stator field and rotor current are 90 deg. out of time phase. With brushes in this position, the magnetizing current only, which is about 10 to 15 per cent. of the normal full-load current is drawn from the line, and the main-line switch can be closed without starting or in any way injuring the motor.

If now the brushes are gradually shifted forward, the line current and motor torque increase slowly at first until the motor starts very gently. As the brush shift is increased the torque curve begins to rise rapidly, so that any desired value of starting torque within the limit of design of the motor in question is available. By actual tests some of these motors have started successfully and without appreciable sparking under 400 per cent. of normal rated torque. This value, however, is somewhat higher than could reasonably be expected in economical design.

Shifting the Brushes Controls the Motor

By merely shifting the brushes perfect speed control is obtained throughout, approximately 75 per cent. of the range from rated speed to stand still. In general 40 to 60 per cent. speed control is ample, and obviously a request for greater range should be avoided unless really necessary as the greater range means a more expensive machine except in certain cases like fan service, where the load falls off rapidly as the speed is reduced.

If the brushes are shifted beyond $a = 180$ deg. the motor will start in the reverse direction. In order to obtain the best commutation, however, it is necessary to interchange two of the primary phases. This reverses the rotating field of the stator, giving it the same direction of rotation as the armature. Commutation is sparkless from about 10 per cent. above to approximately 70 per cent. below synchronism.

The lower speed limit is determined by the torque characteristics rather than by commutation which is very good even to 90 per cent. below synchronism. In the higher range of speeds the torque increases rapidly for a given brush shift with any slight reduction in speed; consequently a slight change in the counter-torque of the driven device affects the speed but little. The converse is true, however, in the lower speed ranges so that the minimum permissible speed depends largely upon the torque characteristics of the load.

Efficiency and power-factor curves for a PCS motor as compared with similar values for an induction motor with rheostatic control show a material saving in power. Furthermore while the power factor of the PCS motor is lower at low speeds yet the apparent efficiency—that is, the product of efficiency and power factor—is much better at all speeds for the PCS than for the induction motor.

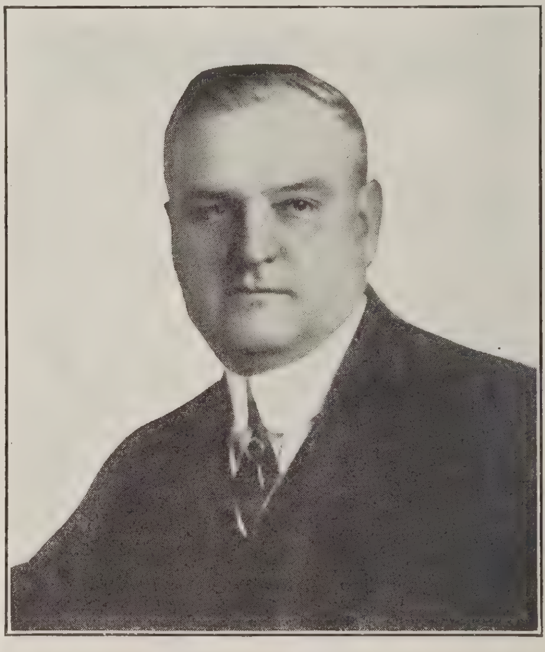
Unfortunately space prevents an adequate description of the PCR speed-regulating sets as applied to fan drives. Such a description will, however, appear in an early issue.

⁂

V. H. Manning is New Director of Bureau of Mines

On Aug. 27 President Wilson appointed Vannoy H. Manning director of the United States Bureau of Mines to succeed the late Dr. J. A. Holmes. A short sketch of the life and work of Mr. Manning is therefore interesting to the coal industry at the present moment.

Mr. Manning was born at Horn Lake Depot, Miss., Dec. 15, 1861. His father, Vannoy H. Manning, Sr., represented the Second Mississippi District in Congress.



VANNOY H. MANNING

The new director of the mining bureau is a graduate of the University of Mississippi, from which institution he obtained the degree A.B. He is married and has two children.

Mr. Manning is a member of the American Institute of Mining Engineers, the Washington Society of Engineers, Cosmos Club, National Geographical Society and the Delta Kappa Epsilon Fraternity. He is also a member of the Home Club of Washington, the Trowel Club and the Mississippi Society of Washington.

For more than 20 years Mr. Manning has been engaged in technical and scientific work under the Department of the Interior. From 1885 to 1910 he was engaged as a civil engineer with the United States Geological Survey, which work required his attention in nearly every state of the Union. In addition to his scientific work Mr. Manning has held a number of important administrative positions in the Government service.

When the Bureau of Mines was established in 1910 he was appointed to an administrative position in the bureau by Secretary Ballinger, and on Jan. 1, 1911, was made assistant director. In January, 1914, Dr. Holmes, who at that time was director of the mining bureau, was compelled to leave Washington and relinquish the active directorship of the bureau. At this time Mr. Manning was placed in immediate charge of the work, and from that time to the present he has served as acting director of the bureau.

During his service with the Bureau of Mines Mr. Manning has had charge of methods relating to appointments, expenditures and the conduct of investigations, loyally supporting Dr. Holmes in every effort to make the bureau of great service to the mining fraternity. Mr. Manning's attention to the details of the bureau enabled Dr. Holmes to devote his time to larger matters of policy and to the coördination of the work of the bureau with that of other Governments and private institutions whose efforts have been along lines of safety and efficiency in mining.

There is no doubt that the appointment of Mr. Manning to the directorship of the mining bureau is well deserved and will meet with the general approval of coal-mining people. His long years of service in Government administrative work and his popularity with his associates in the bureau and his friends outside qualify him to fill with entire satisfaction the important position to which the President has appointed him. The coal industry congratulates Mr. Manning on his advancement and assures him of its undivided support.

Production of Coal in 1914

The production of coal in the United States in 1914 was exceeded by that in only two previous years—1912 and 1913. In 1914 the total production of anthracite and bituminous coal amounted to 513,525,477 short tons, valued at $681,490,643, according to C. E. Lesher, of the Geological Survey. In 1913, the year of greatest production, the total was 569,960,219 short tons. In 1914 the value of both bituminous and anthracite coal decreased slightly more than the tonnage, but the decrease in anthracite, the more valuable output, was slight.

The production of anthracite in Pennsylvania decreased from 81,718,680 long tons (91,524,922 short tons), valued at $195,181,127, in 1913, to 81,090,631 long tons (90,821,507 short tons), valued at $188,181,399, in 1914.

The total production of bituminous coal and lignite decreased from 478,435,297 short tons in 1913, valued at $565,234,925, to 422,703,970 tons in 1914, valued at $493,309,244.

The decrease in the production of anthracite was due in part to mild weather during the winter in the area where it is used almost exclusively for a domestic fuel and in part to decreased exports to Canada.

The decrease in the production of bituminous coal was generally distributed over the country, but there were seven states in which the production in 1914 was greater than in 1913. Two of these states, North Dakota and South Dakota, produce lignite only, and make relatively small output. New Mexico's increase was due to ability to supply markets ordinarily furnished by coal from Colorado, which in 1914 suffered from a serious strike. The other states that showed an increase were West Virginia, Kentucky, Michigan and Oregon. The greatest decrease was in Pennsylvania, where output fell off almost 26,000,000 tons. The most notable decrease was in Ohio, where because of strikes the falling off in production amounted to more than 17,300,000 tons, or approximately half the total output of the state in the year 1913.

Ballads of a Coal Miner—VI

Written Expressly for Coal Age

The Question

By Berton Braley

I WONDER *if a miner guy like me*
Has really got a right to have a wife.
I sure would like to ask my girl; but, gee!—
I ain't got much to offer her in life.

If I spoke true I'd simply have to say,
"I love you, girlie—yes, I do, for fair;
Come be my wife an' share a miner's pay
(Which ain't an awful lot for you to share).

"Come be my wife, an' plan an' scrimp an' save
To keep the wolf from snarlin' at the door,
An' fret each day for fear a fire or cave
Will finish up my shift forevermore.

"Come be my wife—yer home a miner's shack,
The kind you see in every minin' town;
An' take yer chance of strikes an' times that's slack,
An' breathe the coal dust always siftin' down.

"Come be my wife—I'll love you true an' sure,
An' when the babies come I'll love them too;
But probably we'll all be mighty poor
An' have a cruel time in scrapin' through."

It ain't just fair, I know, to ask so much,
An' yet I want her; so I guess I'll try
An' maybe we won't meet hard luck, an' such,
For I might be a pitboss, by and by.

Scientific Humidification

By J. I. Lyle[*]

So far as I am aware no mine has yet been humidified on a scientific basis or in fact in any manner that has been successful. Of those installations regarding which I have accurate knowledge, a few fundamental laws necessary for success have been neglected.

The temperature of a mine is fairly constant, varying with the seasons, so that in winter it is a few degrees cooler than in summer, with but slight fluctuations from day to day or even from week to week.

Generally a mine has sufficient humidity during the summer months, because its temperature is much below that of the outside atmosphere. In winter, however, when the outside air carries but little water vapor and the mine temperature is much higher, the relative humidity is necessarily low.

In order that the air used for ventilation may be able to carry sufficient water vapor to humidify the mine, it must be heated, either by its contact with the mine walls or artificially. The temperature to which it is heated must be at least that of the dew point desired.

Take a mine, for instance, with a temperature of, say, 60° F., where a humidity of 80 per cent. is desired with the outside air at 20° F. and containing 1 grain of vapor per cu.ft. Air at 60° F. and saturated carries 5.75 grains per cu.ft. With 80 per cent humidity, therefore, each cubic foot would have to contain 80 per cent. of 5.75, or 4.6 grains. Now saturated air at 54° F. will just hold 4.6 grains per cu.ft. It is evident from this that it is necessary that the air should not be less than 54° F. when the additional water vapor is added. If at any lower temperature it could not possibly hold the required amount of vapor to give the 80 per cent. humidity.

It must be borne in mind that water cannot be evaporated unless heat is added; or to state it in another way, if water is caused to evaporate in the presence of air without heat being applied, the air will be cooled 8° F. for every grain of water evaporated per cubic foot.

This being true, if the air entering the mine at zero is raised to a temperature of 54°, the only way the necessary moisture can be added would be by blowing steam directly into it. It is well known that the introduction of steam directly into the air current without the production of fog is a most difficult matter, if it may ever be said to be successfully accomplished.

With the case under discussion, with the incoming air containing 1 grain of vapor per cu.ft. it would be necessary to add 3.6 grains per cu.ft., which if done without adding heat, as explained, would cool the air to approximately 28° F. To counteract this cooling effect we could heat the air to 82° F. and then bring it in contact with atomized water sprays and add the 3.6 grains per cu.ft., and as a result of the evaporation it would be cooled to 54°. At this temperature of 54° the air would be saturated, but as it traveled through the mine and its temperature was raised to 60° the humidity would be lowered to 80 per cent. Such a system properly installed would give good results without any fog or other objectionable results. A simpler and more practical method is to first pass the air used for ventilating the mine through a humidifier, where its temperature is raised and the necessary amount of moisture is added simultaneously. Such a machine is now being adopted in textile mills for cooling and humidifying the air.

Here the air passes through a dense and finely divided water spray, where it is saturated. The water used is circulated by means of a centrifugal pump and is heated by the introduction of exhaust steam. Eliminator plates at the outlets are used to separate the surplus water from the air, so that the air is left perfectly free of any fog or other small particles of water that have not been evaporated. Because of the recirculation of the spray water employed by this machine, the amount of water required is small and is equal to that evaporated. This would never exceed 1 gal. for each 12,000 cu.ft. of air used.

The exhaust steam required to heat the spray water (which in turn would heat the air to 54° F.) would be 1½ lb. per 1000 cu.ft. of air handled. Of course, with a large ventilating fan this amounts to considerable steam, but in most mines there is sufficient exhaust going to waste to fulfill the requirements.

To summarize: First, it is necessary that the moisture for mine humidification be injected into the air after its temperature has been raised to approximately that of the mine. Secondly, this moisture must be added in such a manner as not to cool the air below the temperature required to carry the desired vapor. Thirdly, the injection of steam into the air at or near the entrance of the mine is sure to produce fog and cannot add the amount of vapor required owing to the temperature of the air being too low to carry it. Fourthly, the humidity of a mine can be maintained uniformly at a desired point by a properly designed humidifier, with heated spray water, located at the air entrance to the mine.

Explosion in Somerset Field

The Orenda mine of the Merchants' Coal Co., at Boswell, Penn., was the scene of a disastrous explosion on Aug. 31. Boswell is located on Quemahoning Creek in Somerset County. A severe explosion killing five men occurred at Orenda No. 2 on Jan. 25, 1909. This more recent explosion caused the death of 16 men, most of whom were foreigners. It is said that, as in the previous explosion, it was gas, not dust, which exploded. There were 300 men working in the mine at the time.

It was hoped at one time that all had escaped, but it was found that the afterdamp had caused 14 deaths. Joe Mantok, however, was apparently killed instantly by the explosion. John Beegle, a motorman, died in a local hospital later in the day of injuries received, and three others who were badly burned are in a critical condition.

The C. F. & I. Co.'s Field Meet

Between three and four thousand coal miners and their families from all parts of southern Colorado attended the first annual field and track meet given by the Colorado Fuel & Iron Co. at Trinidad on Aug. 14. Two thousand miners took part in a parade. Walsen camp won the first-aid contest. The scores of the competing teams were: Walsen 99, Berwind 98, Morley 97 and Cameron 95. The contest consisted of four events.

Extension of Service of U. S. Department of Labor

Perhaps few of our readers are aware that the United States Government, through the Department of Labor, has inaugurated as a part of the Division of Information a country-wide employment bureau. It is the belief of those connected with the work that it will go far toward improving business conditions in the United States.

The underlying principle of the work is perhaps best expressed by the Secretary of the Department of Labor in the following words: "The Department of Labor has established distribution branches throughout the country for the purpose, on the one hand, of developing the welfare of the wage-earners of the United States and improving their opportunities for profitable employment and, on the other hand, of affording to employers a method whereby they may make application for such help as they need, either male or female, citizens or alien residents, and have their wants supplied through said distribution branches."

Comparative statistics show that there has been in some portions of the United States a surplus of labor, while in other portions there is a deficiency. It is believed that this condition will be almost, if not entirely, eliminated by this work. This will appear from the following explanation of the system under which the work is conducted. The United States has been divided into 18 sections, or "distribution zones," as they are called, and in each of these zones an employment office has been opened. These zones in nearly every case have been subdivided and branch offices opened under the jurisdiction of the controlling zone office.

Thus a large number of employment offices have been opened by the Government. At these places the employer who needs help, skilled or unskilled, can secure what he wants without any trouble or expense. No fee is accepted by the Government from those seeking employment.

Every postmaster in the United States is a representative of this employment bureau. At every postoffice will be found, on application to the postmaster, blanks for the use of employers in need of help and for unemployed persons seeking employment. These blanks are transmitted by the postmaster, free of charge, to the proper zone office, where they are registered. Proper help is then selected for the employer, either from applicants residing in the city in which the office is located, or from other applications on file. On the day the employer's application is received by the distribution office, a copy is sent to the Division of Information at Washington, D. C. At frequent intervals these applications are assembled and published in the form of bulletins, and distributed to all distribution offices, thereby making it possible for each office to know where help of any description is in demand and enables that office to furnish the information to anyone looking for work or workmen.

Economy in Ventilating Mines With Purchased Power

By Thomas A. Mather*

SYNOPSIS—The use of purchased current has brought to the attention of many coal mine officials leaks in power consumption before unnoticed. Particularly in opening new mines, money may be saved by installing temporarily small fans and motors of a capacity sufficient for the immediate needs of the development, putting the permanent fan in place only when the mine has been brought practically to its capacity of production.

The advent of central power plants, which have demonstrated their ability to furnish power cheaper than it can be made in small quantities, has forced the consumers of current to practice more rigid economy. The receipt of the monthly statement from the power company, with the paying out of hard cash for the amount of power used, has opened the eyes of power users to the necessity of installing the most efficient electrical machinery in order to slow down the wattmeter as much as possible. This is also true of the companies that generate their own power at central plants.

Coal companies have always practiced economy in the making and the use of power (or at least they have thought so) even when they were most extravagant. It is not many years ago that they thought it economical to use the cheapest kind of steam boilers, regardless of their efficiency, because they got the coal at first cost. When they began to charge their power plants with the market value of the coal consumed they saw the falsity of their old ideas of economy, and today the mines are equipped, except in rare and isolated cases, with the most improved and efficient type of steam boilers and power apparatus.

A gradual change is taking place with the coal companies that are using purchased power. Since they are buying power their attention is turned toward equipping their mines with the most economical and efficient electrically driven mechanical devices. Yet after all this is the same old economy of power clothed in a different garb to suit the changes and varying conditions through which we have passed.

Minimum Current Consumption Is a Problem

The most difficult problem to solve at a new mine where purchased or central station power is used is that of the fan to furnish adequate ventilation with a minimum consumption of current.

The old idea was to install as soon as the mine was opened a ventilating fan large enough to provide a sufficient quantity of air for the mine when it had reached its maximum output of coal and the highest water-gage or pressure on the ventilation. Take for illustration a modern mine which will eventually require from 150,000 to 200,000 cu.ft. of air per minute with a water-gage of from 2 to 2½ in.; a fan to produce this quantity of air with reversible steel casing, together with the foundation and installation, will cost from $5000 to $6000 and will require an electric motor of from 100 to 125 hp. for driving.

A new mine will not require this amount of air until it has been developed to its maximum output, which may require several years to accomplish, and if the fan is slowed down to produce 50,000 cu.ft. of air, which quantity would be ample for the first or possibly the second year, the efficiency of the fan and motor would be only about 20 per cent.

Under these conditions it is almost prohibitive to use a large centrifugal fan until the mine is sufficiently developed to require at least 100,000 cu.ft. of air per minute, while the greatest efficiency would be obtained when the fan was producing its maximum quantity (150,000 to 200,000 cu.ft.) with a 2- or 2½-in. water-gage.

In order to get away from this enormous loss of power, a disk type of fan could be used to good advantage in ventilating new mines with purchased power during the preliminary work of opening and until the mine had been developed to such an extent that it required a volume of air in excess of from 80,000 to 90,000 cu.ft. per minute. A disk fan capable of producing from 70,000 to 90,000 cu.ft. of air per minute while the airways are short and the pressure low can be bought for one-sixth to one-eighth the cost of a 16-ft. centrifugal fan and can be operated with less than one-quarter the power that a larger fan would require in order to produce the same quantity of air.

Money Saved by Discarding Large Fan

I have in mind a new mine which was opened about 2 years ago. A 16-ft. centrifugal fan was installed and fitted with a 100-hp. motor. When run at a speed to develop about 65,000 cu.ft. of air per minute, the cost of the power consumed was about 75c. per hour, or $18 per day. This is at the rate of 365 times $18, or $6570 for a year. This fan was replaced by a 6-ft. disk fan, which is still in operation and developing 65,000 cu.ft. of air per minute with a ½-in. water-gage, and the actual cost of operation for one year was $1055.02—less than $3 per day, against $18 per day for the centrifugal fan. This means a saving in one year of $5514.98. In other words, the cost of the centrifugal fan has been saved by the use of the disk fan in one year. The 6-ft. disk fan is now working at its most efficient point, but I see no reason why a larger disk fan, one capable of producing from 80,000 to 85,000 cu.ft. of air per minute with a 1-in. water-gage, cannot be used while the airways are comparatively short and the resistance low.

When purchased power is being used there are a number of things to be carefully considered in determining the size of fan and motor to provide the ventilation during the opening and developing stages of a new mine. The rate of development and number of persons who can be employed from time to time will determine the quantity of air required.

---

*Inspector of Mines, 18th Bituminous District of Pennsylvania.

It is most economical, of course, to have as near the right size of fan and motor as possible so that each will be working at nearly its maximum and most efficient and economical capacity. Where conditions will remain nearly the same over a relatively long period of time, perhaps several years, as concerns the quantity of air required and the water-gage developed, the right size of fan and motor can readily be determined. But in new mines the quantity of air required and the mine resistance change so rapidly, owing to the steady increase in the number of employees and the constantly increasing length of airways, that a fan and motor of the right size are good for only a short period of time.

It Is Important That the Motor Should Be of Proper Size

The size of motor should be given careful consideration. The loss in a 100-hp. motor is about 10 kw., which means that the losses in a motor of this size operating a fan continuously for 30 days will be 7200 kw.-hr. With power at the rate of \$0.02 per kw.-hr. this amounts to \$144 per month. In a 10-hp. motor the losses would not be over 2½ kw., or 1800 kw.-hr. in a month, amounting to \$36. This fact alone will justify the use of a motor of nearly the proper size.

In order to save the losses due to an oversized motor the best arrangement to ventilate a new mine would be to put in a medium-sized fan and drive it with a single-speed motor of sufficient capacity to operate the fan for about 6 months. A larger motor could then be used which would run the fan at its maximum capacity, which should be reached in another 6 months. The speed of the fan necessary to increase the quantity of air from time to time could be accomplished by changing the sizes of the pulley. A second fan could then be installed of sufficient capacity to provide ample ventilation until the mine is developed to nearly its maximum capacity, the quantity of air being increased as before by changing the size of the pulleys. By this method an enormous saving in power bills can be effected by the coal company before it is necessary to install a large permanent ventilating fan.

The type of motor should also receive careful consideration. In direct current variable speeds can easily be obtained which would make it an ideal motor for use on a ventilating fan during the opening and development of a new mine as the speed of the fan could be regulated to produce the required volume of air; but since the power furnished by the power companies is alternating current, motors of this type must be used. So far the various devices to secure variable speed on alternating-current motors are either costly or dissipate considerable power without doing any work, and as economy is the watchword a single-speed induction motor will no doubt be found to be the most economical.

In the future more attention will be given to the size and number of airways in order to reduce the velocity of the air current. High velocities mean high water-gages, which will require larger motors and will increase the power bills.

No matter how small the electrical equipment of a mine may be, if purchased power is going to be used the coal companies should engage the services of a competent mine-electrical engineer to make an estimate of their requirements.

"Extracts from a Superintendent's Diary"

Three weeks have passed since the soul of Arnold Cross passed into the great beyond, but his heartbroken mother seems to be unable to become reconciled to his tragic fate.

I received a letter from her today in which she poured out her heart to me, and the note of hopelessness and despair permeating every paragraph of the letter has had a most depressing effect upon me. The grief and the rebelliousness of the mother are almost too terrible to contemplate.

In her letter she tried to justify her rebelliousness. It seems to her that the awful mining disasters that rob mothers of their sons, sweethearts of their lovers and wives of their husbands are of such frequent occurrence in mining history that the womenfolk of the mines learn to look forward to them as possibilities from infancy and so are prepared for the ordeal if it finally overtakes them. And besides as a result of the numberless disasters of the past, mining villages must be filled with widows and mothers and sweethearts thrown into close sympathy and communion with one another by the memories of their menfolks sleeping the long sleep just over the hill.

It is all very reasonable to her, such possible reconciliation to a fate that has long been feared as inevitable; but she feels that her own case is so different. She had hoped against hope from the first day that her son took up mining that he would give it up in answer to her pleadings, and the terror that haunted her day and night was born of the fear that she might not succeed, but never of impending doom.

The depressing effect of her letter upon me was due to the memories that it inspired rather than to the things actually expressed. Just the single sentence about the sweethearts, wives and mothers drawn together by common sorrow started a train of recollections that reaches back into the first days of my mining experience and is interwoven with each of the years that have passed since then. The heartaches and the sorrows, the sacrifices and the forbearance—how they stand out now in bold relief and testify to the grim fortitude of the miners' women! Sprinkled through all of those years are pictures of homes broken up, families separated and romances shattered. In a twinkling of an eye the plans and the yearnings of years have been set at naught—generally not even time for a last farewell.

Occasionally, however, on a piece of loose rock or perhaps on a trap door, a last wish or a parting message is discovered by the rescue parties in search of bodies. It may be a simple request covering the disposition of scanty worldly possessions, or even keepsakes, or it may be a last declaration of love; but it is always written in a firm, bold hand showing that the writer was not afraid to die, and in his last moments, facing impending death, thought not of himself, but only of those left behind.

Such messages are in themselves pathetic enough; but the real tragedy comes when those who have been left behind attempt to live their lives in keeping with the last expressed wish of a loved one suddenly taken from them—mothers striving to hold their families together after the father's wages have been cut off forever; young girls trying to remain true to departed lovers.

How romantic it all sounds; but in reality the romance became tragedy long before it became a memory.

Reminiscences in Ventilation

By F. C. Cornet*

SYNOPSIS—Early testing of a pneumatic mine-ventilating machine by a committee of prominent French and Belgian engineers. Some amusing recollections. The advent of the Guibal centrifugal ventilator. Description of the pneumatic machine.

In connection with the subject of mine ventilation, I recall some incidents, in my early life in France, that may prove of interest to many who have seen or heard of Combes' "Treatise on Mining," which was published at Liege, Belgium, in 1846. This book was for many years a standard work in Belgium and France and contains much that is of interest at the present day. The author, M. Charles Combes, was an authority whose word was generally accepted as law in Europe on all mining matters.

It is interesting to read the report of a test made on a large pneumatic ventilator that had been erected on the Bois de Saint Ghislain mine near my old home in Belgium. The accompanying illustration, Fig. 1, shows the elevation of this early ventilator as it appears in Combes' "Treatise on Mining," to which I have referred. Similar machines were erected all over the Belgium and French coal fields during the period of 1828-1857, when they were finally displaced by the advent of the famous Guibal ventilator.

The test to which I have referred was made on Dec. 17, 1841, by a committee of prominent Belgian and French engineers, who spent an entire week in the effort to make the test exhaustive in every way. There were of course luncheons and banquets given, without which no decent affair of this kind or any other was ever pulled off in Belgium or northern France.

On the committee were M. Guibal, the Belgian who was soon to give to the world another ventilator that would speedily send to the scrap pile all the pneumatic machines then in use; M. Glepin, a Frenchman who had done much experimental work in an attempt to develop a centrifugal fan that would create a sufficiently high water gage to ventilate the deep, narrow, long and circuitous passageways and workings of the Belgian and French mines; and M. Combes, whom I have mentioned. The results of the tests made on the Bois de Saint Ghislain machine were recorded in due form by M. Glepin, the historian of the committee. Even the luncheons, banquets and menus, the flowers on the tables and the high quality of the wines are appropriately mentioned.

In his account, M. Glepin tells at length how he himself had previously installed two centrifugal fans at this same mine. The first raised the water in the tube to a maximum height of 0.832 in., and in order to maintain this gage he states that it was necessary to run the fan at such a speed that it soon had to be scrapped. M. Glepin then designed another fan to take the place of the one wrecked, and this was run continuously without mishap at a speed of 84 r.p.m., which was incredibly high for those days. At this speed the water gage rose to 1.82 in., which, however, was much too low to encourage the owners of the mine to deepen and develop the workings as they had contemplated doing.

It is certainly interesting to read M. Glepin's opinion of centrifugal fans, which was based on these two unsuccessful attempts to ventilate by this means the mine at Bois de Saint Ghislain. He frankly admits his failure and concludes, "while centrifugal fans will perhaps be used to handle large volumes of air at low pressures, they will never be able to create the high water gages necessary for the efficient ventilation of the deep mines of Belgium and France." He therefore advised the operators at this mine to install the pneumatic machine shown in Fig. 1, and was unwilling to charge the company a penny for his time and labor, which had resulted only in failure.

But M. Glepin not only lived to see that he was mistaken in his conclusions in regard to centrifugal fans, but he was the first to install a Guibal fan at the Carnieres mine. It may be assumed in truth that M. Guibal, who signed the report of the committee without hesitation (and he never signed anything that he did not believe), had at that time, 1841, no idea of the ventilator that he produced later and which made his name famous the world over.

An Amusing Incident

It was my good fortune to have studied at the School of Mines at Mons, under Combes, Guibal and Glepin. I was therefore well acquainted with these great men. This recalls to me an amusing incident of my boyhood when I was 10 years old and which shows there were also some notable women at that time, one of whom was Mme. Degorge, the owner and active manager of the Degorge Iron Works, where the Bois de Saint Ghislain pneumatic machine was designed and constructed.

She was a Belgian whose father, M. Legrand, had founded the iron works at the beginning of the 19th century, which at his death he left to his daughter, who had married a Frenchman named Degorge, a lawyer of Valenciennes, a city just over the border. The Belgian laws of those days did not allow a married woman to carry on business under her maiden name, which explains why the Legrand Iron Works became the Degorge Iron Works. Mme. Degorge was an intrepid woman and let her husband stick to his law business while she assumed the management of the works on the very day after her father was buried. She kept at it for many years, and few people who had any business with the Degorge works ever knew there was any M. Degorge. My father's home was not more than 500 or 600 ft. from the main entrance to the works.

The incident I am about to relate made such a deep impression on my mind that I shall remember the awe-inspiring Mme. Degorge to my dying day. It happened one afternoon that as I was returning from school this good lady captured me on the highway and carried me bodily to my father's presence and there accused me of playing some especially bad tricks on the works' gatekeeper, a portly gentleman hardly less dignified than his employer. I may say that the woman's act impressed me more deeply than the punishment administered later by my father.

---

*Mining engineer, Charleston, W. Va.

Although the pneumatic machine to which I have referred has passed into history, a brief description of its working and capacity will be of interest, as showing with what difficulties those engaged in the early mining of coal had to contend.

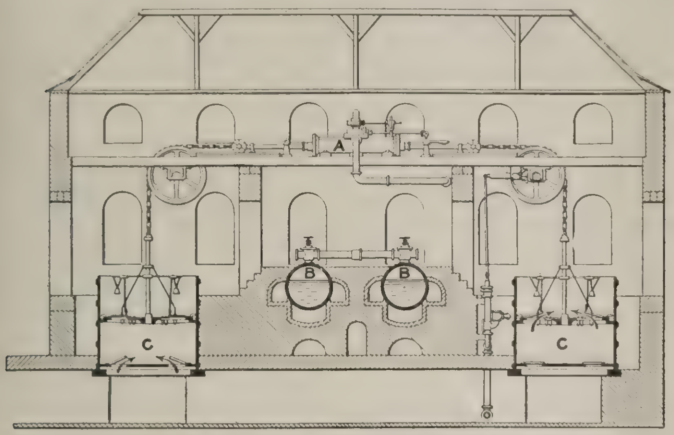

FIG. 1. PNEUMATIC MINE VENTILATOR

Description of the Machine

A brief study of Fig. 1 will serve to explain clearly both the machine and its operation. The figure shows two large vertical cylinders installed in a building which served as an engine room for the operation of the machine. Steam from the boilers entered the steam cylinder *A*, placed on a platform or floor above the boilers *BB* and in a position midway between the cylinders. The two air cylinders *CC* were open at the top, each being fitted with a piston, which is shown in plan in Fig. 2. Each of these pistons contained eight large valves, which were balanced as shown in vertical section in Fig. 1. A similar series of valves was arranged in the bottom of each cylinder. All the valves opened upward, and the action of the machine was exactly similar to that of a large air pump. The two piston rods were connected by a link chain with the piston rod of the steam cylinder. The action of the pistons was alternate, one rising as the other fell. As each piston rose, air was drawn from the mine into the cylinder, through the valves, as shown by the arrows at the bottom of the cylinder on the left. At the same time, the mine air which had been drawn into the cylinder on the right was discharged through the valves in the piston, as indicated by the arrows in that cylinder. It will be observed that one feature in which this machine was seriously lacking was that the mine air was discharged into the building, from which it had to find its way into the outside atmosphere. Beneath the air cylinders was a brick tunnel having an area of 38.64 sq.ft. and a length of 104 ft., extending to the top of the upcast shaft. This shaft was 811 ft. deep and was connected by a succession of tortuous passages or airways having a total length of 5667 ft. and an average sectional area of only 21.11 sq.ft. The downcast shaft was 1004 ft. deep. The sectional area of the downcast shaft was 94.07 sq.ft., while that of the upcast shaft was only 51.28 sq.ft. The surface elevation was the same at both shafts.

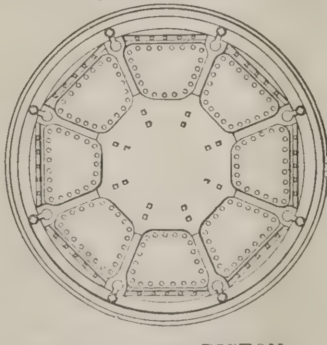

FIG. 2. AIR PISTON AND VALVES

Each air piston had a diameter of 11 ft. 9¼ in. and a stroke of 6 ft. 4 in. and made 12.8 double strokes a minute. At this speed a calibrated anemometer showed an air volume of 11,775 cu.ft. per min. The water in the gage oscillated at each stroke of the piston in a remarkably uniform manner from 2.308 in. to 8.724 in. This made the average water gage 5.516 in., and the power on the air was therefore $5.516 \times 5.2 \times 11{,}775 \div 33{,}000 =$ say 10 hp. Since the brake horsepower of the steam engine was 24.93, the mechanical efficiency of the apparatus was $10 \times 100 \div 24.93 =$ say 40 per cent., which compared very favorably with the efficiency shown formerly by the centrifugal fans—namely, 27 and 29 per cent. respectively.

Total Cost of the Installation

The expense of installing and operating this machine was enormous, especially when considered in respect to its small capacity for handling air. Following are some of the items showing the expense attending the construction, installation and operation of the machine:

The bill paid the Degorge Iron Works for the construction of the machine, boilers, piping and accessories complete was $8497.20. The cost of the installation, including the building having a slate roof, a 50-ft. smokestack and a brick tunnel beneath the building connecting with the upcast shaft, was $4210.24. This made the total cost for the construction and installation $12,707.44.

A record was kept for five years, showing the expense for continuous operation night and day, except five hours on Sunday when the machine was not in operation. This record showed that the annual cost to operate the machine was $2581.45, to which should be added for interest on the investment 6 per cent. and for depreciation 5 per cent., making a total of say $4000 a year for operation and maintenance. Following are the details of this average annual expense:

Wages, day time, one man at 50c. and one at 40c., $328.50; wages, night time, one man at 50c., $172.50; slack coal of inferior quality, 1642.5 tons, at $1 per ton, $1642.50; green soap to grease the pistons, 2422 lb., at 7c. per lb., $169.54; oil and tallow, $128.20; repairs, $140.21; making a total of $2581.45.

This expenditure for ventilation would at the present day be prohibitive in coal mining. Based on the circulation produced, the expense of operation and maintenance would be practically 92c. per 1000 cu.ft. of air per min.

Coal Mining in Spitzbergen

It is reported, says E. W. Thompson in *Commerce Reports,* that a Norwegian syndicate has purchased some coal-mining rights in Spitzbergen for about $300,000. Although Spitzbergen is one of the northernmost points of land in the Arctic Circle, navigation is possible there during a few months of summer.

Coal is becoming increasingly difficult for neutral European countries to obtain because of the employment in military service of many of the coal miners in England and Russia. It may therefore become profitable to obtain coal from points hitherto considered inaccessible.

The Labor Situation

SYNOPSIS—A strike in the spring hardly seems probable owing to the long period of slack work, the lessened demand for coal and the straitened funds of the union. The leaders seem to realize this fact. Destitution due to slackness of work is creating much uneasiness in Ohio and Illinois. The Industrial Relations Commission reports on the Colorado strike.

President John P. White, of the United Mine Workers of America, is talking preparedness and peace, and well he may emphasize the latter, for times are not propitious for a general strike, and he undoubtedly knows it. It is of course hard to know what will happen. The increase in wages which the machinists and oil men are receiving tends to make the miners anxious for a larger wage. The developments in the United Kingdom are also not without influence, and the cost of living as affected by the war also furnishes a reason for an increased remuneration. The miners are also anticipating in the anthracite field that they will receive a part of the income provided by lower freight rates should the price of anthracite in the market be sustained.

All these things tend to make the miners discontented, and the leaders naturally are afraid that they will get out of hand and forget that there are no resources available for a long struggle. The merchants in the anthracite region are preaching peace. They realize that the $2,300,000 weekly distributed by the coal companies is the lifeblood of their trade, and they are quietly urging a peaceful settlement. The Wyoming and Lackawanna region distributes $1,380,000, the Lehigh region $300,000 and the Schuylkill region $620,000 weekly.

These figures do not represent the whole loss that the field may sustain in case of a shutdown, because if the mines are not working the railroads will be idle also. The business men are afraid that if the winter is mild, the heavy stocks on hand will be sold in the spring whether a strike occurs or not, and business will not be any too brisk.

Destitution in the Hocking Valley

The situation in Ohio meanwhile is not bettered. The appeals for food and clothing for the miners have fallen on deaf ears. The people of Ohio are disposed to blame the miners and would rather give to men who are deprived of any kind of a living rather than to men who are idle because they are haggling or have been haggling for a price.

In the Hocking Valley 2000 miners are idle in the specific localities where appeals have been made for help. Only $6000 has been furnished to the Ohio National Guard for disbursement, and supplies have been purchased by that body for which $2000 is still owing. Adjutant-General Houet estimates that $600 worth of supplies are needed daily to provide adequately for the emergency. Unless winter brings the opening of mines now closed, the outlook will be desperate for the men who are at present idle.

In Illinois, Duncan McDonald, the secretary-treasurer of District No. 12 of the United Mine Workers Union, which covers that state, has issued a statement that 50,000 Illinois miners are out of work and thousands more work only one day a week. He says mining conditions are worse than ever before in the history of the industry in that state, and that the prospects for the winter are worse than they were at this time last year. Of the 286 local unions in the state, 89 have been out of work from a month to six months during the past half-year. In the other 200 locals, the work has been slack and men were lucky to get two days a week. About 16 mining concerns in the state have gone into bankruptcy during the year. One, at Benton, McDonald says, owed the miners $40,000 when it failed. In all, the miners have lost $100,000 in wages through mining-company failures. He says that conditions in nearly all the states are the same and that the nonunion miners in West Virginia are the only ones working full time.

The West Virginia operators are preparing to meet such assaults in a paper known as the "West Virginia Mining News," published by Wightman D. Roberts, of Huntington, the author of the pamphlet entitled "The Man with a Job," which was recently reviewed in "Coal Age." Karl F. Schoew, formerly a mine inspector in the Fairmont region, a contributor to the columns of this paper and now a coal-land broker in Huntington, will collaborate with him. Roberts was at one time editor of the "Appalachian Mine Record,' of Roanoke, Va.

Charles J. Albasin, of Bridgeport, Ohio, president of the eastern Ohio miners (subdistrict No. 5 of District No. 6), has denied that he is willing to accept an offer to succeed John Zalenka, of Brookside, Ohio, recently deceased, as secretary of the Pittsburgh Vein Operators' Association of Ohio. He denies also that the offer has been made.

Industrial Relations Commission Report

The Industrial Relations Commission made its report public on Aug. 24. Frank P. Walsh, the chairman, and the three commissioners representing labor found themselves in accord and signed a common report. These men were John B. Lennon, James O'Connell and Austin R. Garretson. The two commissioners who with Frank P. Walsh were intended to represent the public, John C. Commons and Mrs. J. Borden Harriman, signed a separate report. A third was signed by the three representatives of the employers.

The report of F. P. Walsh and the labor representatives declares:

> Many typical industrial communities present every aspect of feudalism except the recognition of specific duties on the part of the employer. The employees in such communities are dependent on a single corporation or employer for their livelihood. Furthermore, the employer in many cases controls the social and political life of such communities, either by the complete absorption of local political powers or by domination of the local authorities.
>
> The fundamental rights of citizens in such communities are as a general rule seriously abridged if not actually denied. Among the rights most seriously violated are freedom of speeech and assemblage and the use of public highways. In some cases, as, for example, in Colorado, employers in such communities have assumed to usurp the function of the Federal Government itself in the issuance of money orders, and have not only denied employees access to the post office when located in their company stores, but have opened and otherwise interfered with the mail directed to the employees.
>
> The most extreme form of domination and control exists in what are known as "closed camps," where the employer owns all the land upon which such camps are located, and because of this private ownership, not only exercises control over the local government, but dictates arbitrarily who shall be permitted to come into or pass through such communities.
>
> It is suggested that the commission recommend:
>
> The enactment of appropriate state legislation providing that where communities develop, even upon privately owned land, the powers of the civil government shall not be interfered with, nor shall the rights of access to the residence of any person be restricted, nor shall the rights of persons to come and go unmolested, to speak freeely and to assemble peacefully be interfered with or considered to stand upon a different basis from the rights of persons in other communities.
>
> That the Post Office Department be directed to report to Congress all communities in which the post office is in any company's store or other building operated by an employer or in which the postmaster is a private employer or the agent of an employer.

On Aug. 27 the report of George P. West to the Commission on Industrial Relations was given to the public. It deals mainly with the relation between John D. Rockefeller, Jr., and the strike in Colorado, and puts all the blame for the action taken upon him. Mr. West proves himself a master in abuse and an able lieutenant of Frank P. Walsh.

Governor George A. Carlson, of Colorado, bitterly assailed Frank P. Walsh on Aug. 29, stating that the people of Colorado, who are by no means all connected with the coal business, proved by their votes that they viewed the situation very differently from Walsh. He has since stated that the United Mine Workers of America has conspired to prevent the recruiting of the militia and has employed detectives for that purpose.

Welsh Strike Still Threatens

On Aug. 26 a thousand Welsh coal miners went on strike to protest against the arbitration ruling of Walter Runciman, of the Government Board of Trade. The trouble spread till 30,000 men were idle, and it was feared at first that all the 200,000 men employed in Wales would go on strike. The leaders appear to have tried to keep their men at work, but their endeavors were without avail until certain concessions were made on Aug. 31.

Apparently the main troubles were the exclusion of the surface workers and engineers from the same war bonus granted the miners and the limitation of the bonus to the continuance of the war. It is said that the mine owners have agreed that, while Runciman's award shall be allowed to stand, they will undertake to conclude a supplemental agreement which will give the engineers and surface workers what they demand. Unfortunately, however, on Sept. 1 the South Wales miners voted not to accept this understanding. Contrary to expectation they insisted that the war bonus be put in operation from July 22 instead of Aug. 21.

Use of Briquettes in the Pacific Coast Markets

Owing to the fact that screenings are a drug on the market, briquettes have played no inconspicuous part in the Pacific Coast trade, but so far have not been a success. One important plant was that of the Western Fuel Co. This concern had some time ago about 6000 tons of anthracite screenings on hand and briquetted some of these. They then curtailed the importation of anthracite and sold a great part of their briquettes. They have, however, quite a tonnage left, which is deteriorating. The plant has never briquetted Wellington screenings, and it has now been put in the scrap heap.

The brown lignite of the Ione Coal & Coke Co., which is very much similar to German lignite, is being experimented with for briquetting purposes. A German plant and system are being installed, and briquettes in the form of the German brown coal briquettes will soon be put on the market by that company.

In regard to the briquettes being made by the Pacific Coast Coal Co., it is said that 1200 tons were brought to this market. A report on them could not be obtained, but they are expected by the trade to be put on the San Francisco market.

A briquette known as carbon fuel is also being tried out in this market. This briquette is made by the Pacific Gas & Electric Co. at their Oakland plant. It is made from the residue of oil, which should be very dry before being used, and is broken up to a fine powder. No binder is used. Although a strong pressure is exerted on the briquettes, they are very soft when they come out of the machine and must be handled carefully. However, they harden after a while, and in fact become very hard under certain conditions. Wet winter weather is not favorable for that process, however, and the sale of the briquettes has therefore had to be stopped, as they were breaking up too much in this weather, and no sufficient dry stock has been kept on hand.

When burning, this fuel has an odor, and it smokes at first and then glows. It has no flame and is used mostly in furnaces. Its ash content is very low and carbon very high, the producer claiming over 15,000 B.t.u. It is an excellent steam fuel and will have to be taken into consideration as an important competitor in the Pacific Coast markets. At the present time, however, it is still in the development stage and is being experimented with.

American and Other Coal in Peru

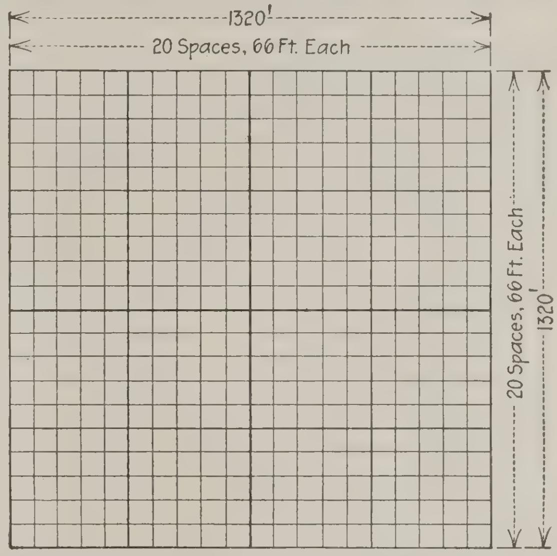
The importation of coal into Peru, says a supplement to *Commerce Reports,* fell from 150,660 tons in 1913 to 139,382 tons for 1914, which decrease is attributed largely to the embargo on shipping on this coast during the latter part of 1914 due to the presence of belligerent warships, the prevailing high freight rates from both American and European ports and to the establishment of modern coaling facilities at Panama, where many of the West Coast steamers now coal rapidly and at reasonable rates. The imports of coal from the United States increased from 11,461 tons in 1913 to 15,802 tons in 1914, but the imports from Germany fell from 32,696 to 12,044 tons.

The large proportion of imports from Great Britain, being 86,222 tons last year in comparison with 78,958 tons in 1913, may be attributed to the old trade that has existed between the West Coast of South America and Wales for many years, the product being brought out in sailing vessels or tramp steamers, which usually return with cargoes of sugar, cotton or nitrates from Peru and Chile, and also to the fact that belligerent warships occasionally used these ports for coaling purposes.

Obtaining the Approximate Area of Irregular Plats

By F. F. Jorgensen*

A plat of squares made on tracing cloth or paper, as in the accompanying illustration, is a convenient means to employ in obtaining the approximate area of irregular pieces of territory. This plat represents 40 acres on a scale of 200 ft. per in. and is divided into 400 equal squares representing one-tenth of an acre, or 4356 sq.ft. each. These small divisions are 66 ft. square, but they may be made as small as desired when it is necessary to obtain results closer than one-tenth of an acre.



PLAT FOR OBTAINING AREA OF IRREGULAR PLOTS; EACH SMALL SQUARE = $\frac{1}{10}$ ACRE; SCALE 1″ = 200

If these divisions be reduced to 33 ft. on the side there will be 1600 equal squares in the plat representing the 40 acres, and each square will represent one-fortieth of an acre, or 1089 sq.ft. With 20-ft. divisions representing .009+ acre, or 400 sq.ft. each, there will be 4356 equal squares in the plat. With divisions of the last-mentioned size very accurate results can be obtained.

This plat is convenient to use with mine maps in estimating the acreage worked out each year. The method of using is as follows: Lay the plat on top of the map, making the side lines of the plat correspond with the 40-acre lines on the map. Then count the number of squares that cover the territory the area of which is required. To aid in this counting the lines dividing the plat into quarters and sixteenths are made heavier than the others. For old maps or ones with light and indistinct lines it is necessary to make the plat on extra-transparent tracing cloth or paper.

The plat may be made any size desired, but for maps made on the scale of 100 or 200 ft. per inch I have found the plat representing 40 acres the most convenient.

---

*Chief engineer, Chicago & Northwestern Ry. coal properties, Gillespie, Ill.

Mining Coal in Italy

The only mines of importance in this district, says Consul F. T. F. Dumont, of Florence, Italy, in *Commerce Reports,* are those of coal, sulphur and petroleum. Even these mines are extremely small compared with similar mines in other countries.

The coal deposits occur principally at Castiglia, near San Giovanni Valdarno, Province of Arezzo, and are estimated to contain approximately 17,000,000 long tons of lignite coal known as "lignite Xisolide." It is likely that a more thorough investigation of the limits of the field would materially increase this estimate. Outcrop due to wash occurs in a few places, but generally speaking, and where the principal mine is located, the top of the deposit is about 300 ft. under the surface. The vein averages 75 ft. in thickness and is mined in 6-ft. benches. Speaking in a geological sense, the coal is very young, having scarcely passed beyond the stage of wood. Trunks of trees are found the wood of which shows considerable resiliency. About 35 per cent. of water is found in the coal mined. Interspersed throughout the deposits are infiltrated deposits of clay running from 1 to 6 in. in thickness. The coal when burned gives a large quantity of ash even up to 50 per cent. The part most resembling wood is, after drying in the yards, sold in neighboring cities and villages for heating and cooking purposes, its cost delivered f.o.b. Florence being about $2.70 per long ton.

A large plant for furnishing electric power and light has been erected at the mine mouth which utilizes the poorest coal and waste. The plant is well and economically arranged and is equipped with the most modern machinery. The amount of power used for the machinery of the mining operations is small. The coal is very soft and the use of cutting or drilling machines is impossible. It is broken down by hand and loaded in small mine cars. An inclined plane runs from the surface to the level, and after a sufficient number of cars are collected at the foot of the incline, they are coupled together and hauled up the incline by cables operated by electric motors. The cars are either unloaded in the yard where the coal is spread for drying, or else unloaded directly into railway cars. No other machinery is used in the mine except a few pumps operated by electric motors. The 700 miners turn out 1200 tons per day of 10 hours and receive from $0.58 to $0.96.

The Coal Industry of Belgium

In 1913 the total production of coal in Belgium, says *Commerce Reports,* was 22,841,500 tons. During the first six months of 1914 the production was normal. During the last six months the production has been about half the normal. About 105,000 miners have been at work since the war broke out, as compared with 147,000 usually working in the mining districts of Belgium. The whole industry stopped in August when the Germans entered these districts.

In the province of Liege work first stopped in August. It was resumed partly in September, and the production went up progressively as follows: In October it was 25 per cent. of the normal production; in November it was 30 per cent.; in December, 40 per cent.; in January, 45 per cent.; in February, 50 per cent.; and in March, 50 per cent.

In the province of Hainaut, the Mons and Charleroi districts are to be considered. The work in the Mons district was especially affected from Aug. 23 to Sept. 15, when fighting was going on in these parts. Work was resumed in November; 80 per cent. of the workmen began work, and in order to employ them all, they were divided in shifts working alternately every two days. The production was 45 per cent. of the normal production in November and 50 per cent. in December. In the period January to March, 1915, 65 per cent. of the normal production was attained with the same number of workmen. In the Charleroi district the population was much affected by the war. Only 60 per cent. of the miners resumed work in November, turning out 30 per cent. of the normal production. Since December the situation in Charleroi has improved a little. All production and all stocks were put under the control of the German central bureau at Antwerp. This bureau has power to sell to manufacturers, owners of works, dealers, etc., at prices fixed by itself. The proceeds of the sales are handed to the mine owners after the deduction of a commission to cover expenses incurred by the central bureau. All contracts made before the war or since the occupation are void, and mine owners cannot be considered liable to damage for nonexecution of such contracts. In special cases contracts may be executed with the authorization of the central bureau. This bureau regulates production, sales and prices over all the occupied parts of Belgium. Coal is in little demand now except for domestic consumption.

The Song of the Mine Fan

By Michael Bernard

CASED *in a shell of steel*
Over the uptake shaft,
Here thru the livelong day to wheel,
Causing the upward draft;
Sucking the moist, dead air
Out from the nether murk
Into the noonday's brilliant glare—
This is my ceaseless work.

Into the gloomy pit,
Off through heading and drift,
Sending the air by many a split
Down to the working shift;
Sweeping the gas away,
Carrying off the damp,
Making a clearer, brighter ray
Shine from the miner's lamp.

Turning of arm and blade,
Tireless, swift or slow,
Sending the breath of life to aid
Those in the mine below;
Whirring and pulse and purr,
Surge like a surfy sea,
Keeping the clean, sweet air astir—
This is the work for me.

Editorials

The Purpose of Injunctions

An injunction is a legal means of preventing a wrong for which the law itself cannot or may not be able to furnish a remedy if once the wrong is committed. It was never looked upon as a menace by any of the public till it was applied in labor disputes, and then it appeared to the enjoined as a peculiarly iniquitous proceeding.

Applied to a capitalist or a corporation—and frequently was it so applied—its action appeared wholly commendable. Nearly everyone can see why Morgan or Rockefeller should not commit a wrong and escape the law, or why he should not be allowed to perform some improper act which for some reason can never be entirely corrected even though eventually he may be punished for his wrong action. But almost no one is of that opinion with regard to labor. Some in fact believe that labor has the characteristic of royalty—it can do no wrong.

Recently in Charleston, W. Va., certain miners secured an injunction on the Boomer Coal & Coke Co. restraining it from paying the monthly check-off to President Thomas Cairns and Secretary J. M. Craigo of District No. 17 of the United Mine Workers of America. They recognized in the injunction process an opportunity to secure their rights or what they imagined were their rights in the union. The union leaders, they declared, had secured their perpetuation in office by all manner of trickery, and though these officials were exonerated on trial by the executive board, still there was dissatisfaction, and so these men who normally would be the first to denounce restraining court orders became among the first to demand them.

In District No. 9 a similar use of the ancient principle of injunction has occurred. Judge Brumm, at Pottsville, Penn., has issued a permanent injunction restraining the officers of the executive board of the United Mine Workers of America of District No. 9 from suspending Thomas Butler from membership in the Girardville local. The officers had charged Butler with daring to express his opinion. He had criticized unfavorably some mining legislation in which they were interested, and it was alleged that he did so with the object of disrupting the union.

The union officials in Butler's district deny to union men the right of private judgment. Everyone must think or appear to think as they do. And the miners in that district by their supineness to such dictation seem to demand not only that their elected leaders should be amenable to discipline of act and word, which would to an extent be right as they represent them and accept pay for their services, but they require the same of every individual in the union and the right to punish everyone who takes a different view.

The utter dishonesty of the attack by members of the union and by the *United Mine Workers' Journal* on the trustees of the University of Pennsylvania for the discharge of Professor Scott Nearing, a teacher of economics, is made clearly apparent. Nearing was employed to teach; he was not a mere student paying his way, but an official. A certain amount of leeway should be allowed him of course. Perhaps the trustees were wrong in dismissing him; but if they were, their action was far less reprehensible than that of the officials in District No. 9. Surely a mere union member who pays in to the funds of the union has a right to freedom to vote, to recommend and to plead with fellow-members in the organization to which he belongs. To deny his right to membership and to freedom of speech is to deprive him of the most elementary prerogatives of the individual.

The case was clear, and Butler was absolved of the charges by his local, but the district board stepped in and suspended him from membership for six months, adding as a further penalty the provision that he should be ineligible for office for a period of two years. In giving his opinion the judge ruled that criticism of pending legislation is a personal privilege of every man, so long as it is neither libelous nor slanderous.

Butler has announced himself as a candidate for district president, an office to which he has heretofore aspired. It is clear that had he been shut out of the union he could not have run for office and it would have been difficult if not impossible to have compensated him for the loss of the honor he sought as leader of his fellows.

So the courts have appeared—as so often before—in defense of personal liberty. The injunction is the tool of everyone who has both the need for it and a right purpose for its use. It is the tool of labor when labor is right and the defense of capital when capital needs its protection. The recent actions in West Virginia and Pennsylvania well illustrate its adaptability to the cause of freedom and the public good.

⁂

Industrial Relations Commission

This body, which might well be termed the Commission for Disturbing Industrial Relations, has run its evil course. Its cost cannot be limited to the half a million dollars which was actually expended on it. The wages of agitation are immeasurably smaller than the damage it may cause.

The chairman of the commission, Frank P. Walsh, had an excellent opportunity to perform a great service to his fellow-countrymen. It was his role to act as a great father confessor to the industrial public. He could have induced them one and all to acknowledge their petty meannesses, their low aims and their violations of the law. He could in addition to hearing such confessions have carefully staged for the benefit of the public all those admirable actions and worthy intentions which employers, employees and their respective organizations had done.

But Frank P. Walsh had no such intention. He never for one moment forgot he was a lawyer and a politician. It was not his purpose to unveil the whole truth, only to uncover the peccadillos or larger offenses of those who had quarreled with those people whom he regarded as his clients—the few working people who seethe with discontent and revolt, especially that foreign population which believes itself commissioned to regenerate the United States.

The report of the majority of the commission has already been cast in Uncle Sam's ample waste-paper basket, and Walsh himself will soon be in the discard with the document to which he has signed his name. No one can tell why President Wilson appointed him, for the Chief Executive is the very antithesis of Walsh. He believes in seeking for the best in men and advocates always perseverance and fairness. It was a mistake and one which he has doubtless often regretted when he appointed so unfair a man to such a responsible position.

The plea for the confiscation of estates exceeding $1,000,000 which forms part of the Walsh report is one of its most unfortunate features. The most useful fortunes we have are the large ones. An estate worth $1,000,000 drawing 6 per cent. will provide the owner with $60,000. The millionaire can and often does spend that amount of money in luxurious living.

But the man with a larger fortune is physically unable to spend the income on himself. He may spend large sums in building fine residences, but such money is rather an unprofitable investment than an expenditure, as it lasts for more than one generation. But usually he is utterly unable to spend any large part of his income on his follies. Perhaps 1 or 2 per cent. only is so spent. The rest goes back into business, and thus increases the national wealth. Such a fortune is almost as impersonal as if it were public property, and the placing of such an inheritance under trust restrictions, which Walsh deplores, only completes the quality of impersonality.

It is true that the possession of great fortunes does create industrial unrest largely because of the ability of leaders to use them in fanning into flame a spirit of jealousy. Actually the feeling is far more likely to arise from the presence of the merely well-to-do people who, living near the less fortunate, are more likely to arouse their envy. There seems an unfairness also in large inherited fortunes, and these two objections to them are so strong and reasonable that some animosity toward them is to be expected. Moreover, the political and moral power accompanying great wealth is in a degree a menace to our free institutions, and the possession of a fortune not infrequently undermines the character of its owner and that of those with whom he associates.

But if we clip those fortunes off short, as Walsh and his friends would wish, and apply the money to the extension of education, road building, irrigation, reforestation and the development of those other "important social services which should be properly performed by the nation," are we sure that the country will be more effectually benefited than it would be if the owners of that wealth still had it and still realized that it should be put out where it would at least not depreciate in value?

The possible uses of wealth that Walsh enumerates all have a real value, but still they are by no means without alloy. Reforestation has almost never been conducted at a profit in this country. Irrigation has been a sincere source of regret to many who spent their money in it. Road building as conducted has shown itself to be, not an investment, but a perennial tax. Social service means supplying to persons something they will not save for themselves. Even education is often of doubtful advantage, merely unfitting those receiving it for active toil. Perhaps all these might be made profitable, but evidently Walsh is not advocating them for their economic advantage. He makes no attempt to prove that an expenditure of money on them will be industrially productive.

The rich man may waste his money, it is true, in such unprofitable enterprises, but at his own and evident peril, and he seems to realize that fact better than the public. Some day the people may learn a truer economy, but at present investments that no foolish son of a rich man will venture to tackle, much less the astute father of that foolish son, have a great attraction to the national and state legislatures.

Instances of such expenditures are the improvement of the antiquated Erie canal, which will never pay the interest on its cost, however calculated; the construction of public roads, which last two or three years and need rebuilding at the end of that time; the digging of the Panama canal, which does not pay a dividend and may not pay its upkeep; the national expositions, the erection and operation of which possibly do not educate the public in proportion to their expense, and so on. A nation, like a workingman, will of course spend some money unproductively.

But the point is that the rich man is obliged to expend his money economically or lose it. The public does not seem to realize that it is in the same predicament. It is willing to take these accumulations, drag them away from found and developed profitable uses and throw them to the four winds careless of any future crop.

By greed, by cunning, by qualities perhaps which we do not like as well as by diligence, by intelligence, by self-denial and foresight the rich man sees that his goods increase. He is the source of our economic future. Take his money from profitable employment, spend it for him, educate men, if you will without regard to the ability or willingness of the educated to make a return, provide baths, amusements, comforts and what not for those who will not save to buy these things, and what results? The capital saved for future development is expended in gratifying the wish of the moment.

The time is ripe, owing to the war, for the United States to be the leading financial country in the world. But just now it is the most illiberal nation on earth to its railroad and bituminous coal capital if not to some other forms of investment. If in addition it becomes even worse than Great Britain to inherited fortunes it will never be anything else than financially a vassal to countries where profits are permitted—unless a miracle occurs and the lavish American citizens become as frugal or more frugal than those of France and so make up by saving what is denied as profits.

If any confiscation of our American fortunes comes at the behest of our foreign population—O stranger from less happy lands, if you see anything you want don't fail to ask for it!—it is to be hoped that the money will be put or kept in commerce and permanent profitable construction and not into a hundred and one uneconomic purposes which merely serve to allay poverty, but which do not create that power of production which not only relieves need, but actually in perpetuity removes it from all those who will work and save a little.

Mine-Rescue and First-Aid Meet at Clealum, Wash.

By E. Jacobs*

SYNOPSIS—Another meet showing how loyally the labor unions in Washington are supporting the mine-safety movement, giving time, money and influence to its support. The contest was held on the village street.

The second annual state-wide mine-rescue and first-aid meet in the State of Washington was held at Clealum, Wash., on Saturday, July 31, by the miners and operators of Washington under the auspices of the United States Bureau of Mines, the State Mine Inspection Department and the American Mine Safety Association. The proceedings were under the direction of an executive committee and representatives of the United States Bureau of Mines, but a local arrangement committee relieved the general executive of much of the work of preparation.

INSTEAD OF GOING TO THE BALLGROUND FOR THE FIRST-AID CONTEST, THE WASHINGTON STATE SQUADS USED PENNSYLVANIA AVENUE, IN CLEALUM, FOR THAT PURPOSE

The executive committee consisted of J. J. Corey, United States Bureau of Mines; James Bagley, state inspector of coal mines; Martin J. Flyzik, president of District No. 10, United Mine Workers of America, and D. C. Botting, commissioner, Washington Coal Operators' Association. The United States Bureau of Mines was officially represented by H. M. Wolflin, of San Francisco, Calif., mining engineer, and W. D. Ryan, of Kansas City, Mo., mine safety commissioner. The local arrangement committee consisted of A. A. Batterson, Joseph Parker, J. V. Hoffler, A. W. Hodder, Oscar Haltern, J. E. Morgan, John Lera, Thomas Summerill, Fred Zentner and Elijah Burge. Simon H. Ash, deputy state inspector of coal mines, and David J. Price, engineer investigating cereal-dust explosions, Bureau of Chemistry, United States Department of Agriculture, were the official scorers.

MEET HELD ON VILLAGE STREET

The first-aid contests took place in the morning in the heart of the town of Clealum, a part of Pennsylvania Ave. the full length of one block having been roped off. A good surface measuring 95x25 paces had been prepared along the center line of the roadway. This was watered and rolled. Seats were arranged all around this novel "field" for the comfort of the spectators, of whom fully 2000 were present. Interest was general, and the large attendance, together with the enthusiasm freely shown, gave practical evidence of the growing favor for first-aid work. Many of those competent to express an opinion declared that nowhere else in the Northwest have interest and enthusiasm been so strongly marked and so general as at this state-wide meet.

The gallery erected for demonstrating the explosibility of coal dust was constructed by the citizens of Clealum out of material furnished by the Northwestern Improvement Co., of which C. C. Anderson, of Tacoma, Wash., is general manager.

The two silver cups offered for competition were donated before the annual meet in 1914 by the E. I. du Pont de Nemours Powder Co., with the condition that they should be retained permanently by any team winning them at two consecutive state-wide meets.

Among other donors, District No. 10 of the United Mine Workers of America gave $25 for prizes in the four-man event, and the Clealum local, No. 2512, of the same organization, presented $20 for prizes to the winning teams in mine-rescue and first-aid events. The Roslyn Cascade Coal Co. gave $25 and the citizens of Clealum gave cash to be awarded to the winners. The townsfolk also assisted in other ways. The Clealum Eagles' brass band rendered instrumental selections throughout the morning in town and in the afternoon played at Ball Park, where the mine-rescue events were held.

The following doctors judged the first-aid events: D. O. Kearby, F. W. McKnight and Charles F. Stafford, of Clealum; A. L. McClenahan, of Ellensburg; George H. T. Sparling, of Newcastle; H. J. Davidson and B. J. Lloyd, of Seattle, and J. W. Mowell, of Olympia, surgeon to the Washington Industrial Commission. Dr. W. N. Lipscomb, American Red Cross industrial surgeon, who is engaged in Red Cross work in the state, acted as field surgeon. Dr. Sparling also assisted Dr. Newgard, of Roslyn, in the mine-rescue events, by taking the temperature of the competitors.

FIRST-AID CONTESTS

The actual program of first-aid events was printed, but its contents were not revealed to any but the committee until the teams were on the ground ready to undergo the trial of their skill. It was as follows:

Team Event—Driver is caught between cars and sustains a compound fracture of the left thigh, resulting in severe arterial hemorrhage, and simple fracture of the right upper arm. His right eye is badly bruised and his right ear is severely torn. Treat, improvise stretcher and carry 50 ft. Time, 15 min.

One-Man Event—A man has been overcome by gas. Owing to the lowness of his working place it is impossible to carry him in an erect position. Bear him 20 ft. to a place where the bearer has room to stand upright; then carry him 20 ft. by the "shoulder carry." Perform artificial respiration by the Schaefer method for one minute. Time, 7 min.

Four-Man Event—A miner is rescued after falling into a chute. His right shoulder is dislocated and four ribs are fractured on the right side. He has a severe scalp wound

---

*Post Office Box 645, Victoria, B. C.

AFTER THE CONTEST THE FIRST-AID AND MINE-RESCUE CORPS LINED UP AN

above the right ear, with hemorrhage. Treat, improvise a stretcher and carry 100 ft. over an obstruction. Time, 20 min.

Two-Man Event—A man falls on an electric wire, face down, and is rendered unconscious. Rescue, using safety-first methods; perform artificial respiration for two minutes. Time, 6 min.

Three-Man Event—A car runs down a room and catches the motorman. His lower right arm and hand are badly mashed, and severe arterial hemorrhage follows. His left leg is cut and severely bruised above the knee. Treat and load on a stretcher. Time, 15 min.

Team Event—A miner having omitted to timber or take down a piece of cap rock is caught when it falls. His spine is injured, his left foot is badly smashed and right leg is fractured below the knee, his nose is broken and his lower jaw is fractured. Treat, carry 50 ft. under cave which still permits of 3 ft. of clearance. Stand in upright position to show work. Time, 20 min.

Four-Man Event—A miner has been rescued following an explosion and has sustained the following injuries: Burn on back of head and neck, simple fracture of right leg below the knee and compound fracture of the kneecap of the left leg. Treat. Time, 17 min.

The discounts recommended by the American Mine Safety Association were those used. These will be found recorded in the account of the "State-Wide First-Aid Contest in Illinois" in the issue of "Coal Age," June 12, 1915, on p. 1030.

The awards for the team events were as follows: First prize, silver cup, presented by the E. I. du Pont de Nemours Powder Co., American Mine Safety Association medals and $10 in cash; second prize, $10 in cash.

In one-man event: First prize, $3; second prize, $2. In two-man event: First prize, $5; second prize, $3. In three-man event: First prize, $7.50; second prize, $5. In four-man event: First prize, $15; second prize, $10.

In deciding the winners of prizes in the team events, the total number of points obtained by members of a team in all events was taken into account. The scores in the four-man events were added together, and prizes were awarded to the teams making the highest and second score thus figured.

FIRST-AID CONTESTANTS

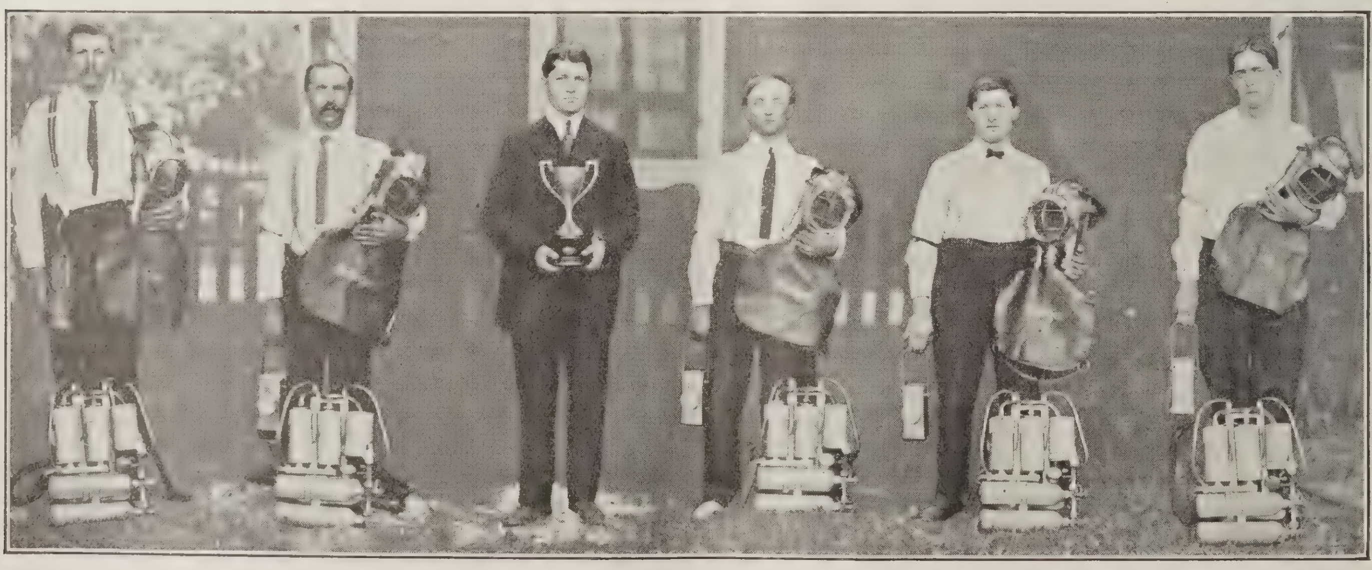
Thirteen teams contested in the first-aid events, as compared with eight in the 1914 competition. These were: Clealum, No. 7 mine of the Northwestern Improvement Co.; Tono, Washington Union Coal Co.; Beekman, Roslyn Fuel Co.; Clealum mine, No. 2 team (N. W. I. Co.); Carbonado, Carbon Hill Coal Co.; Roslyn, No. 5 mine (N. W. I. Co.); Tono, Washington Union Coal Co. No. 2 team; Ravensdale mine (N. W. I. Co.); Roslyn, No. 6 mine (N. W. I. Co.); Black Diamond, Black Diamond First-Aid Association; Roslyn, Roslyn Fuel Co.; Roslyn No. 3 mine (N. W. I. Co.); Clealum, No. 7 mine No. 2 team (N. W. I. Co.).

In the first full-team event Clealum No. 7 mine took first place with 100 points, the Carbon Hill Coal Co.'s team from Carbonado came second with 97 points, while Clealum No. 7 mine No. 2 team was third with 96 points.

In the second full-team event Clealum No. 7 again led with 100 points, but Clealum No. 7 mine No. 2 team made 99 points, while the Carbon Hill Coal Co. scored only 89 points. Thus Clealum No. 7 easily won with 200 points, and No. 2 team of the same mine was second with 195 points, while the Carbon Hill Coal Co.'s team, which had started so well, was third with 186 points.

In the one-man event No. 2 team of the Washington Union Coal Co., the Roslyn Fuel Co.'s team and the Roslyn No. 3 team tied for first place, each obtaining 100 points. In a second contest the Roslyn Fuel Co.'s team received a perfect score, and the Washington Union Coal Co.'s squad was second with 89 points.

In the two-man event the three teams which tied in the one-man event tied again with the Roslyn No. 5 team. All received a perfect score. A second contest gave Roslyn No. 5 team first place with 97½ points and the Roslyn Fuel Co. team second place with 97 points.



RESCUE TEAM OF ROSLYN, NO. 6 MINE WHICH WON FIRST PRIZE FOR MINE-RESCUE WORK AT THE CLEALUM MEET OF JULY 31, 1915

From left to right—Tony Stanfel, captain; Tony Tomatich; J. E. Morgan, instructor; Matt Mohar; William Bedner, and J. M. Boose

WERE PHOTOGRAPHED WITH THE OFFICIALS OF THE COMPANIES INTERESTED

The three-man event was likewise hotly contested though more demerits were scored. Clealum mine No. 2 team received 100 points, but Clealum No. 7 mine, the Beekman team of the Roslyn Fuel Co., the Carbon Hill Coal Co. team, the Black Diamond First-Aid Association and Clealum No. 7 mine No. 2 team each obtained 98 points. A second trial of skill separated the five contestants, but still left two with 100 points—the Beekman team of the Roslyn Fuel Co. and team No. 2 of No. 7 mine, Clealum. These two had again to compete, and the latter won, securing 98 points, while the Beekman team received 5 demerits.

In the first four-man event the team from Clealum No. 7 mine, the Ravensdale team and that of Roslyn No. 6 each obtained 100 points. The Washington Union Coal Co. fell behind, receiving one demerit. Clealum No. 7 mine No. 2 team made only 98 points.

The second four-man event gave three teams a perfect score—the team of Clealum No. 7 mine and No. 2 team at Clealum and No. 2 team of Clealum No. 7 mine. The Washington Union Coal Co. No. 2 team received one demerit. As a result of the two four-man events Clealum No. 7 received a perfect score of 200 points, while the Washington Union Coal Co. No. 2 team tied with Clealum No. 7 mine No. 2 team, each having 198 points. Another contest had to be held, and in this the Washington Union Coal Co. team maintained its score at 198 points, but the Clealum No. 7 mine No. 2 fell back to 196½ points.

As Clealum No. 7 mine team of the North Western Improvement Co. obtained the highest aggregate in all events both this year and last, it was entitled to permanent possession of the silver cup, and the judges made the award accordingly. This team consists of the following members: William Saul, captain; Wilson Clarke, Joseph Parker, Henry Owens, Fred Ashurst and Joseph Andreotty, patient. The team receiving second prize, Clealum No. 7 mine No. 2 team, was composed of Frank Koester, captain, William Clarke, Joseph Hodgson, Isaac McGee, John Stofko and Rudolph Mayta, patient.

MINE-RESCUE CONTEST

The mine-rescue contest was held in the afternoon in the Ball Park, situated a short distance out of the town. A long covered gallery had been erected temporarily for the purpose of this contest and for demonstrating the effect of the use of certain explosives.

The contesting teams in this event each consisted of five men, including the captain. They were all equipped with artificial-breathing apparatus. The event as scheduled was as follows: A mine fire in a side entry is beyond control; the crew will enter and put up a temporary wooden stopping at the entrance. Just as the stopping has been completed, one of the helmeted men is found to have fallen in distress; he is carried to the front of the grandstand, a distance of 50 to 60 yd., and revived. Time, 25 min.

Discounts to be made in this contest were as follows:

Preliminary:	
1. High pulse, for each member	3
2. Failure to remain in smoke room, each member	4
3. Failure to name tests for apparatus, each test	5
4. Apparatus not properly adjusted to wearer	7
5. Loose joint or connection, each	12
6. Breathing bags, flat, each apparatus	8
While Performing Event:	
7. Failure to maintain 2-yd. interval advancing	2
8. Failure to test condition of roof	3
9. Failure to test for presence of gas	4
10. Failure of captain to give command	4
11. Failure of member of crew to obey command	5
12. For breathing external air intentionally	15
13. Failure to protect live men against mine gases	10
14. Failure to complete event in time specified	6
15. Failure to use life line in smoke	8
16. Losing time or doing unnecessary things	4
Total points	100

Seven teams took part in this contest: Carbon Hill Coal Co., Carbonado; Ravensdale mine, N. W. I. Co.; Clealum mine, N. W. I. Co.; Roslyn Fuel Co., Beekman; Roslyn No. 5 mine, N. W. I. Co.; Roslyn No. 6 mine, N. W. I. Co.; Washington Union Coal Co., Tono No. 2 team.

The rating of the prize-taking teams was: Roslyn No. 6 mine, first, with 95 per cent.; Washington Union Coal Co., second ($10 cash), with 84 per cent.; and No. 5, Roslyn No. 5 mine, third ($7.50 cash), with 83 per cent.

The first prize was a silver cup, donated by the E. I. du Pont de Nemours Powder Co., to be won two successive years by the same team, American Mine Safety Association medals and $10 cash. The winning team consisted of A. Stanfel, captain; J. M. Boose, William Bedner, A. Tomatich and W. Mohar. The members of the second-prize team were R. B. Ober, captain; John Ismay, Robert Wigley, Thomas Wigley and Thomas Kruger. The third-prize team included Walter A. Sneddon, captain; D. Shields, R. Lucas, J. Heathcock, Jr., and Luther Lloyd.

Dudley Michell, of Victoria, B. C., instructor in first-aid and mine-rescue work for the British Columbia Department of Mines, judged the contest and was assisted by H. M. Wolflin. John Parker, of Newcastle, rendered much service in expediting the work of the contest.

MINE EXPLOSION DEMONSTRATIONS

Demonstrations of the inflammability of coal dust were given during the afternoon, with the object of showing to miners and mining men generally how necessary it is to exercise care in placing holes and firing shots in mines, since a windy or blown-out shot is liable to cause an explosion that may result in the loss of many lives. The first demonstration was given by firing a charge of Monobel, a permitted explosive, into a dust-laden gallery, which did not cause an explosion. Afterward two other charges were fired into the same gallery, each charge consisting of one pound of black powder, and each caused an explosion followed by fire. The attendance at the Ball Park was larger than at the first-aid contests in the town, there having been between 2500 and 3000 people present to witness the mine-rescue event and the explosive-firing demonstration.

Among many others who attended and coöperated in making the meet a success were C. H. Younger, of Kirkland,

WINNERS OF FIRST PLACE IN FIRST-AID CONTEST FOR TWO CONSECUTIVE YEARS

Clealum No. 7 team of the Northwestern Improvement Co. Left to right: Back row—Wilson Clark; William Saul, captain, Fred Ashurst; Henry Owens. Front row—Joseph Parker; Joe Andreotty patient.

Wash., chief inspector, Department of State Factory Inspection; Clarence Parker, industrial insurance commissioner, and many coal-mine company managers and superintendents. The North Western Improvement Co. was represented by C. C. Anderson, Tacoma, general manager; Peter Bagley, superintendent of the company's Roslyn division; Arthur Hodder, superintendent of the Clealum division; J. D. Scott, superintendent of Ravensdale mine; J. E. Morgan, assistant superintendent of Roslyn and Clealum mines and in charge of first-aid and mine-rescue work. Other companies were represented as follows: Roslyn Fuel Co., by Charles E. Jones, general manager; Washington Union Coal Co., Tono, by E. S. Brooks, general superintendent; Osage Coal Co., Cumberland, by W. D. Williams, superintendent; National Coal Co., Cumberland, by Edwin Husband; Pacific Coast Coal Co., by Natt Moore, chief engineer, Seattle, and Ed. Bergen, mining engineer, Burnett; Roslyn Cascade Coal Co., by William Mackay, manager, and Roslyn Coal & Coke Co., by A. F. Plant, manager. E. Jacobs, of Victoria, secretary of the western branch of the Canadian Mining Institute, was one of the visitors from outside the state.

OUTPUT OF STATE IN 1914

As indicating the extent of the coal-mining operations of the State of Washington, the following summary for the year 1914 has been taken from the last published report of the state inspector, James Bagley:

The number of coal mines and openings of all kinds was 58. The total production of coal was 3,040,361 short tons; average value at mine, $2.35 a ton; total value, $7,142,084. The total production of coke was 78,573 tons; average value at ovens, $5.15 a ton; total value, $404,126. The total number of coal-mine employees was 5647—outside employees, 1264; inside employees, 4383. The average number of days operated was 206. The yearly production of coal per employee was 555 tons; the daily average per employee was 2.69 tons. The production of coal by counties was as follows: King, 1,042,607 tons; Kittitas, 1,237,564 tons; Lewis, 87,558 tons; Pierce, 553,841 tons; Thurston, 112,189 tons; Whatcom, 6602 tons. Coke was produced in Pierce County only, the total for the year being 78,573 tons.

⁂

Montana First-Aid Meet

By John L. Boardman*

SYNOPSIS—The Montana union miners exhibit their interest in the safety of their fellows and hold a most successful two-day meet at Billings, Mont.

The second Montana State-Wide First-Aid Meet was held at South Park, Billings, Mont., July 23 and 24, under the auspices of the Montana Coal Operators' Association, the United Mine Workers of America, district No. 27, the Anaconda Copper Mining Co., the United States Bureau of Mines and the American Mine Safety Association.

Teams were present from Klein, Roundup, the Anaconda Copper Mining Co.'s mine at Sand Coulee, Washoe, the Smith mine at Bear Creek, Red Lodge, the Smokeless and Sootless mine at Bear Creek, Stockett, the Boston & Montana Reduction Works at Great Falls, the Anaconda mine at Butte, the West Colusa mine at the same place, the Washoe Reduction Works at Anaconda and the Leonard mine at Butte.

MINERS UNION TAKES A LEADING PART

The judges, who were eight in number, were all medical practitioners. The committee of arrangements consisted of Henry Drennan, James Hunter and Robert Condon, president, vice-president and secretary-treasurer respectively, of district No. 27, United Mine Workers of America; W. D. Ryan, mine safety commissioner of the United States Bureau of Mines; C. W. Goodale, chairman, Bureau of Safety, Anaconda Copper Mining Co.; M. F. Purcell, secretary-treasurer, Montana Coal Operators' Association, and John L. Boardman, foreman of car No. 5, United States Bureau of Mines.

The teams from Lehigh and Carpenter Creek had been expected, but failed to attend. At 1 p.m., July 23, all teams and officials of the contest assembled at the Northern Hotel and embarked in automobiles furnished by the Billings Chamber of Commerce. The cars then lined up, and led by a band also furnished by the Chamber of Commerce, paraded to South Park, where they were unloaded and the field meet began at 1:45 p.m.

The contest consisted of a one-man, a two-man, a three-man and a full-team event. In each the teams were required to work two problems, one each day, making eight in all. At 3 p.m. the teams had completed the first four problems and turned the field over to the mine-rescue demonstration.

AN EXPLOSION FOLLOWED BY A MINE FIRE

A representation of a mine had been built of 2x4's and tar paper, in which it was proposed to have an explosion and to rescue supposed victims. The explosion took place according to schedule, but on account of the extremely hot sun the flash of the black powder used in the demonstration set fire to the heated tar paper, and before the rescue crew could enter the tunnel the entire structure was in flames. The men who were to have acted as victims were obliged to escape through the sides of the mine before the rescue crew arrived. So from the viewpoint of the rescue crew the demonstration was more or less of a failure, but from that of the audience it was a spectacular success.

Immediately following the mine explosion an association football game was played between teams from Roundup and Klein, in which the Klein team won by a score of 3 to 1. The prize for this game was $100.

On the second day, July 24, the teams came to the grounds at 1 p.m., in automobiles, but without the parade, and immediately went to work on the other four problems.

LEONARD MINE OF BUTTE TAKES FIRST PLACE

The first prize, consisting of American Mine Safety Association silver contest medals and a silver loving cup donated by Dr. McDonald, of Stockett, was won by team No. 5 of the Leonard mine, Butte, but the A. M. S. A. medals were not received in time for presentation to the winning team. The members of this corps were as follows: George Ethier, captain; Homer Hagens, James McLeod, Saul Ryan, William Barraugh and Frank C. Deakin.

The second prize, consisting of American Mine Safety Association bronze contest medals and $75 cash, was won by team No. 9 of West Colusa Mine, Butte. These medals also failed to arrive in time. The members of the team were as follows: Frank Tanhauser, captain; R. Allen, James Blake, W. Lewin, W. Kelly and B. McDermott.

The third prize, consisting of $50 cash, was won by team No. 10 of the Washoe Reduction Works, Anaconda. This team was tied for third place by team No. 6 of Klein, but in working off the tie team No. 10 won third place. The fourth prize, consisting of $30 cash, was won by team No. 6 of Klein. The fifth prize, consisting of $20 cash, was awarded to team No. 8 of Tracey, Sand Coulee post office. The special prize of a silver loving cup presented by the Montana Coal Operators' Association and held for the past year by the Red Lodge team was won this year by team No. 10 of Anaconda for making the highest average in the team problems.

Promptly at 9 p.m. all members of the teams and the officials connected with the meet assembled at the Northern Hotel and seated themselves at a banquet. After coffee and cigars were served, and under the direction of W. D. Ryan, who presided, a number of officials and guests were called upon and responded with short talks on various subjects touching the work for the coming year. Prizes were presented by Robert Condon, secretary-treasurer, district No. 27, U. M. W. of A., and James Needham, general manager of the Republic Coal Co. A resolution was adopted regretting the untimely death of J. A. Holmes, former director of the United States Bureau of Mines, and commending his life of faithful service to the mining industry.

⁂

United First-Aid Corps Meet

By Lewis Richards*

The United First-Aid Corps of the Fourth District, Delaware, Lackawanna & Western R.R. Co. coal department, held a most successful first-aid contest at Harveys Lake, Penn., on Aug. 14. It is estimated that 8000 persons attended, 4000 of whom traveled on special excursion trains which consisted of six sections with 10 coaches to a section.

The contest was close, eight teams averaging between 99 and 100 per cent. Some of the work was declared by the judges to be so good that it could hardly be termed first aid.

Twenty-four teams entered the competition. The first prize of $75 was won by the Loomis inside team, which made a score of 100 per cent. This Loomis mine is owned by the D., L. & W. R.R. Co. coal department. The second prize was $50 and was awarded to the Harry E. colliery of the Temple Coal Co., which had a rating of 99.83 per cent. The third prize was won by the Baltimore shaft team of the Woodward colliery of the D., L. & W. R.R. Co. coal department, the rating being 99.66 per cent. The other scores were as follows: Pettebone mine (D., L. & W.), 99.5 per cent.; No. 9 breaker (Pennsylvania Coal Co.), 99.33 per cent.; No. 20 tunnel, Truesdale mines (D., L. & W.), 99.13 per cent.; No. 1 slope (D., L. & W.), 99 per cent.; Bliss mines (D., L. & W.), 99 per cent.; Woodward outside team (D., L. & W.), 99 per cent.; Central team from Scranton (D., L. & W.), 98.75 per cent.; Storrs No. 2 team from Scranton (D., L. & W.), 98.66 per cent.; Auchincloss mines (D., L. & W.), 98.33 per cent.; Loomis outside team (D., L. & W.), 98 per cent.; Plymouth Coal Co., 97.83 per cent.; No. 1 Red Ash, Woodward mines (D., L. & W.), 97.66 per cent.; Pine mine of Scranton (D., L. & W.), 97.66 per cent.; Avondale mine (D., L. & W.), 97.5 per cent.; Raub Coal Co., 97.08 per cent.; No. 17 slope, Woodward mine (D., L. & W.), 96.33 per cent.; Forty Fort Coal Co., 96.33 per cent.

---

*Foreman car No. 5, United States Bureau of Mines.

*Secretary and inside foreman, Truesdale Mines, 212 East Green St., Nanticoke, Penn.

In the boys' event only D., L. & W. boys took part. The Truesdale breaker boys made 99.83 per cent., receiving a prize of $10, and the Woodward breaker boys 99.33 per cent., being awarded the second prize of $5. The doorboys at the Woodward colliery made 96.17 per cent.

Troop I, Boy Scouts, of Kingston, was the only troop entered in the Boy Scouts' event. Though schools and churches were permitted to enter their juvenile members none took advantage of this opportunity. The Scouts made 100 per cent. and received a prize of $10. All the boys did excellent work. The Woodward boys had been organized only a short time. The Boy Scouts used improvised material, and their instructors are to be commended for the excellent showing made by the troop.

The president of the United First-Aid Corps of the Fourth District is John Thomas, foreman of the D., L. & W. R.R. Co. coal department mine rescue service. The vice-presidents are George Harlow, of the Woodward mines, and Henry H. Hitchins, inside foreman at Auchincloss colliery. The manager of the field was Charles Enzian, of the Bureau of Mines. The judges were Drs. D. G. Robinhold, Charles L. Shafer, J. A. Smurl, W. W. Waters, C. E. Bennett and J. H. Hughes The judges did not regard time as an element in determining the winners, the judgment being rendered wholly on the excellence of the work and not on the speed with which it was executed.

⁂

Compensation to Injured Men

In Colorado some miners are working who took part in the Balkan wars. Some of these have already lost a limb, and when the matter of insurance against accident arises, it is realized that the loss of another limb would result, not in mere reduction of earning power, but in complete incapacitation. As the law now stands, the company which employed such men would be obliged to pay as much as for the loss of two limbs, when only one was lost in the service of the company.

The companies are presenting this objection before the Industrial Relations Commission of Colorado and are seeking to have the law modified so that they will not be obliged to discriminate against those men who, being already afflicted, much need the work. Men who are not possessed of all their limbs and faculties are more liable to injuries than others, and it is not considered right that the company should pay the excess insurance rate which the hiring of such men involves.

Nor is it a desirable arrangement for the employees themselves; for it will inevitably result in the employer protecting himself by not hiring or by discontinuing the employment of crippled or otherwise abnormal men when such crippling or abnormality has not resulted from service to the company. In this way it will be hard for men of this kind to get work, as their labor is at once more hazardous and less effective.

The Victor-American Fuel Co., which presented the proposition to the commission, stated that it did not intend to discharge any of its men during the present biennial period; that it would assume the increased risk and increased insurance cost; but it requested the commission to arrange that the law be changed at the next session of the Legislature so that this trouble will not exist.

⁂

Safety Meets at the Panama-Pacific Exposition

In view of the great interest manifested by first-aid teams from mining colleges in the Third Annual Joint Field Meet to be held by the United States Bureau of Mines, the American Mine Safety Association and the California Metal Producers Association in San Francisco, Sept. 23 and 24, the rules committee has withdrawn the restrictions against such teams participating in the meet.

The ruling previously made that only teams from bona-fide mining, smelting and milling operations should be admitted to the interstate contests of Sept. 24, thereby restricting teams from mining colleges to participation in the demonstrations of Sept. 23, has been modified to provide that such teams and teams from state departments or other institutions interested in safety in mining, but not concerned in mine operation, may compete among themselves on the 24th for a special prize for the most proficient team from an educational institution.

It is hoped that a special prize or cup may be offered as an award to the team winning in this special competition. It is believed that this modification of the rules governing the meet will result in the sending of a large number of teams from the various colleges and universities in the West.

⁂

Americans Won't Work in Mines

About 50,000 of the 180,000 mine workers in the anthracite coal region of Pennsylvania are classed as "Americans," but this figure includes every employee born in this country, though many of their parents are foreign and do not speak a word of English. Mine superintendents in the region state that Americans would rather earn $1.50 a day at some "clean collar" occupation than twice as much in the mines. They attribute this to the false pride of the Americans, who have come to look down on manual labor.

"It takes more than one generation to make a miner," said an old Welsh foreman the other day, "and yet the second generation born in America invariably leaves the mines. The miners in the hard-coal districts of Pennsylvania are probably the cleanest laboring-men in the world. They take a thorough scrub every day, and when you see them downtown in the afternoon in their outdoor clothes you can't tell whether they work in the mines or in a store. But the American young man seems to imagine that some sort of social stigma attaches to the coal dust and the daily bath.

"Who are the men who dig your excavations and subways in the big cities? Italians, mostly. The Irish used to be willing to do it, but they no longer are. In the mines it is the Slavs that are doing the bulk of the work. Roughly speaking, we have, besides the 50,000 'Americans,' about 76,000 Slavs, 12,000 Italians, 11,500 Irish, 10,000 Austro-Hungarians, 6500 Welsh, 6000 Germans, 6000 English and 2000 men of other nationalities."

Discussion by Readers

Efficient Mine Foremen

Letter No. 1—I desire to offer the following remarks as showing what an efficient mine foreman can do in the way of maintaining good ventilation in a mine in his charge, and hope it will start a discussion of this question that may result in a very general improvement in conditions relating to good mine ventilation.

One occasionally visits a mine where his observations lead him to conclude that the foreman in charge either lacks the ability to apply practically what knowledge he has or that his store of resourcefulness is extremely limited. This is the case with many mine foremen when left to their own resources; they depend too much upon their assistants to carry on the actual work and give the necessary directions in the mine of which they are the nominal head.

Some time ago I visited a mine where I found the conditions, so far as ventilation was concerned, in a chronic state. Indeed, the air was so bad that it was not possible to see any distance ahead in the entries or rooms. There were 16 drivers hauling coal to a single sidetrack, and all of them were using oil lamps. As the amount of air traveling was insufficient to carry away even the smoke of the lamps, it may well be imagined what the condition was in the airways. One might suppose that the trouble was owing to the fan being too small for the ventilation of the mine or to the area of the airways being insufficient for the volume of air required. The fan, however, was sufficiently large and the area of the airways ample for a circulation four times the quantity of air necessary to ventilate the workings.

The trouble was not with the mine or its equipment so much as with the foreman in charge. This man spent most of his time on the tipple, where he could breathe freely, and the ventilation of the mine was left to take care of itself. Since the general enforcement of mine legislation tending to improve conditions in all mining districts, I have thought it impossible to find conditions in any mine as poor as they were here. Even the mules were unable to pull coal, although that was not necessary, as the miners could work only three or four hours each day. By that time, the smoke of the lamps and powder used in blasting had so filled the mine that the men were obliged to quit work and go home.

Compare these conditions with those that I am about to describe, which followed immediately on a change being made in the foremanship of the mine. The old foreman left and a new man was put in his place. According to all accounts, the new man has worked wonders in the mine. He has made it possible to get a full day's run each day. The miners put in a full day's work and the mules pull the coal without difficulty.

You ask, How did the foreman accomplish this change? I answer, It was very simple. The fan was capable of producing 65,000 cu.ft. of air per minute, although under the former management the circulation of air at the working face was only 15,000 cu.ft. per min. Under the old system, the mine was ventilated by a continuous current. The new man got to work promptly. He discovered that most of the stoppings or brattices were leaking badly. In fact, the wonder was that any air at all was able to reach the working face. He replaced the old stoppings of decayed brattice boards with substantial rock and cement. He split the air current in two places. Within a short time the conditions were so improved in the workings of the mine that it will be remembered by the men as long as they live.

A few days ago I met "Old Tom," who has worked in this mine for 15 years and is nearly done digging coal. Old Tom is 50 years of age and has what is called the "miner's asthma," as a result of the bad ventilation of the mine. He gasps as he talks. In reply to my inquiries as to his health, he said: "I'm feeling pretty good this morning (gasp); I'm a whole lot better than I was before this new man came here. Do you know (gasp) if that Jim Jones was still foreman in this mine, I would have been dead by this time. The new man sure knows his business (gasp). Where I used to load but two cars a day, I can now load four cars (gasp) and then walk out with only taking one rest, where I used to have to rest four times (gasp) before getting out of the mine. The new fellow sure is a fine man and knows his business."

Meeting the boss driver a little later, and remarking on the condition of the mules, he explained: "Yes sir, they are looking well and feeling good; but you should have seen them before the new man came. All of them were played out before noon, and many a time I have had to haul a mule out of the mine. They could not work long in that air, but it is all right now." It is wonderful what a little practical knowledge and good management can do in a mine.

These are but two simple illustrations of the grateful feeling that existed among the men for the accomplishment, by the new mine foreman, of what the company had always been paying for and expected was being done in this mine.

It is unfortunate that so many mine foremen, like many day workers, require watching. The great difference is, however, that a careless, indifferent mine foreman can and does cause incalculable harm, and endangers the life and health of every man in the mine to a far greater extent than is true of the ordinary mine worker.

WILLIAM CROOKS.

Kimberly, Ala.

Letter No. 2—The ventilation of a mine seriously affects every man that enters. Other features connected with mining, such as the hoisting of the coal, the method of working adopted, the drainage of the mine, etc., only indirectly affect the mine employees. The ventilating current has been called very aptly, the "lifeline" of the mine.

While ventilation is the most important element in the mining of coal, it is strange to observe how little attention is given to the matter as a rule, except in cases where the mine is particularly gaseous and its efficient ventilation becomes a necessity.

Every "mine manager" as the mine foreman is called in Illinois, is supposed to know the theory of ventilation as applied to mining. But how often it happens that the foreman in charge of a mine is ignorant or inefficient, and as a result the working places are badly ventilated. Too often the main object in view is to obtain cheap coal and reduce the cost of production to the lowest possible point, and in doing this the foreman is constantly striving to beat his own previous record. Cheap coal is all right when its production does not interfere with or prevent the systematic work of mining and the maintenance of safe and sanitary conditions in the workings.

It is generally remarked that the majority of mine accidents are owing to carelessness. As a matter of fact, however, many of these accidents can be traced to the inefficient ventilation of the mine. They are too often the result of breathing air that is largely depleted of its oxygen and highly charged with deleterious gases, which cause languor in the workmen and induce carelessness. In this condition, it cannot be denied that many employees take chances that they would not take otherwise. Aside from this, there are other reasons why every mine should be well ventilated. The breathing of good air goes far toward reducing feelings of dissatisfaction on the part of the worker—the grouch is taken out of the man, and he feels better.

Now observe for a moment the effect produced sooner or later as the result of inefficiency on the part of the foreman in charge of a newly opened mine. At first there is an abundant supply of air, and it is perhaps necessary to leave two or more crosscuts open near the face so as to reduce the force of the air current, in driving narrow work. Later, if the foreman is inefficient and does not carefully supervise the work of building the stoppings, they soon develop leaks, with the result that the supply of air at the working face grows constantly less.

When a mine is developed under these conditions, it is only a question of time when the air supply at the face will be insufficient, and it will be necessary to repair the stoppings, which is often done at great expense; because in many cases the rails have been removed and it is difficult to get the necessary material to hand for building the stoppings and making them air-tight. As a result, much patchwork is done, both on doors and stoppings, and still the air supply will often be found insufficient, and it becomes necessary to shorten the distance of air travel by opening temporary airways or crosscuts through abandoned workings.

In most cases splitting the air current has been carried to the limit, and frequently the only recourse that remains is to sink a new air shaft, enlarge the airways, or install a booster fan at some point in the mine. Sinking an air shaft is often impracticable, while enlarging the sectional area of the airways for thousands of feet is generally prohibitive of that method also.

Under these conditions, the installation of a booster fan is resorted to by a foreman who has neglected to carefully consider the question of the future ventilation of his mine when the work of development was in progress. The booster fan is generally operated by electric power. Speaking of boosters, it must be remembered that in many cases such a fan accomplishes only the churning of the mine air. However, impure air in motion is better than stagnant air, and some good is accomplished even then.

The question that presents itself to the thoughtful man is, Why should any mine be brought to such a condition that it cannot be ventilated by the main fan at the surface? In the development of a large territory, ample preparation should be made at the start to furnish the maximum circulation required in the future development of the mine. The proposed plan and output of the mine should be determined and the necessary equipment provided. In the development of the mine, an efficient mine manager (foreman) will build good stoppings as the work proceeds, employing men for that purpose who understand what is necessary to be done. As far as practicable the same men should continue to do the same work from day to day. The practice of having some men build stoppings one day and of employing others to do the work the next day should not be tolerated, but the men engaged in this work should be responsible for the results.

Under a shale or slate roof an efficient foreman will often keep a track in both entries or airways, for the purpose of cleaning up falls that constantly occur. It will frequently prove good practice to arrange to take the empties in on one entry while the loads are hauled out on the other, and this will not only insure that both entries are kept in good condition, but will also greatly facilitate the ventilation of the workings when extended. In all these arrangements, the future working of the mine must be kept continually in mind. It is important to remember that it is not sufficient to provide a ventilating fan that is guaranteed to produce a given quantity of air at a certain speed, when no attention is given to the conditions underground. The airways must be kept open and unobstructed in order that the fan can do its work.

The question is often asked, Why is it that so large a number of mines have a good supply of air at the shaft bottom and on the main airways, while the working faces are so poorly ventilated? In answer to this question, it may be stated that the mining laws are often to blame for such a condition. In most coal-mining states, the law requires a specified volume of air to be circulated in the mine. This volume is usually 100 cu.ft. per man per minute, and 500 cu.ft. per animal employed in the mine. In most cases, the law fails to state where this volume of air should be measured, and as a natural result the measurement is taken at the foot of the intake or downcast shaft.

The bituminous mine law of Pennsylvania (1911) requires the mine foreman to measure the air once every week at or near the main inlet and outlet airways in the mine and also at the last cut-through in the last room and in the entry beyond the last room (art. 9, sec. 4). The Illinois mine law requires the air to be measured at the foot of the downcast and the upcast and provides further that doors, curtains or brattices shall be placed for conducting the required amount of air into the working places. The law leaves, however, much to the judgment of the mine inspector, and here there is room for argument, since one inspector may differ in his judgement from another. In my opinion, the inspector should be required to enforce laws and not obliged to make them. The making of the laws can only be intrusted safely to the representatives of the people appointed for that specific purpose.

It is true that the Illinois law requires the "mine examiner" (fireboss) to measure with an anemometer the amount of air passing in the last crosscut or breakthrough of each pair of entries, or in the last room of each division in longwall mines, and at all other points where he may deem it necessary, and to note the results of such measurements in the mine examiner's book kept for that purpose. But suppose he does not get a reading; he either reports "no reading," or he makes no entry in the book for that place. The state mine inspector is supposed to examine these reports. To secure good ventilation in all mines, however, at the working face, a law is required that will provide a certain definite quantity of air in circulation at the inby crosscut on each pair of entries and in the last breakthrough in each room, similar to the requirement of the Pennsylvania law.

East St. Louis, Ill.

Preventing Mine Explosions

Letter No. 7—In his letter No. 5, *Coal Age,* Aug. 14, p. 268, John Rose asks if the suggestions made in previous letters on this subject are strictly followed, will they "eliminate such explosions?" To this question, I answer "Yes," but they must be strictly followed.

I believe every recent explosion has been the result of someone in some way slipping a cog; that is to say, overlooking or neglecting some precaution that every one connected with the mine should observe. Some place has been allowed to become dusty; some shot was improperly prepared, or overloaded, or tamped with coal dust; or mixed explosives were used; or the ventilation has been permitted to become disarranged and to remain so till sufficient explosive gas has accumulated to cause an explosion; or something has been allowed to happen that should have been prevented.

The old adage is, "Accidents will occur in the best regulated families," but I believe that by eternal vigilance they can be reduced to a minimum.

I think that William Crooks, in his letter No. 3, July 24, p. 143, struck the keynote of the whole situation when he said: "In my opinion, the true solution of this question lies in a higher sense of duty among mining officials and a more thorough and intimate knowledge of the elementary principles of mining by the rank and file of mine operatives. Attention has well been drawn to the great need of education of mining men and of coöperation on the part of every mine worker and mine official," and adds, "As long as mines are operated in a careless and inefficient manner disasters are liable to happen at any time."

In regard to the question of strong air currents, I am not an advocate of excessive air currents. I believe that after introducing enough air into the mine to comply with the law and to so dilute as to render harmless the various mine gases, there is nothing to be gained by a further addition of air, which might increase the danger. The more air that is circulated through the mine the more moisture is carried out and the more difficult becomes the thorough humidifying of the air and prevention of dust. Also, a high air velocity keeps more dust in suspension and tends to pick up dust from the loaded cars on haulage roads and carries it in suspension or deposits it on timbers, ribs and gobs. Also, the more air supplied, the more oxygen there is present to help feed an explosion if one should occur.

I do not want the foregoing to be construed as advocating insufficient ventilation. On the contrary, I am a strong advocate of ample ventilation, but like all good things there can be too much of it.

In regard to the last two paragraphs of Mr. Rose's Letter No. 5, it must be remembered that the most efficient and competent man is apt, at some time, to have someone under him err, and I venture the assertion that, even if a human factor is not discovered in the cause for any particular explosion, it is there just the same.

Edw. H. Coxe.

Knoxville, Tenn.

Mining Laws and Legislation

Letter No. 10—In his letter No. 8, *Coal Age,* Aug. 21, p. 309, Mr. Hogarth has cited a portion of the law, art. 4, sec. 24, which he assumes I have either overlooked or disregarded in discussing the responsibility of the assistant mine foreman, and which he considers the final affirmative answer as to the said responsibility.

Instead of regarding this section as being clear, concise and final in this respect, from its phraseology and construction, I consider it, if not decidly equivocal, at least capable of a double meaning. I believe that its real intent and application cannot be determined without reference to previous portions of the same article.

When taken alone it must be admitted that this section is capable of being understood to mean that the assistant, as such, is amenable to the same penalties for the violation of any of the requirements of the act as the mine foreman, or it may be taken to mean that when the assistant is performing the duties of the foreman, during the latter's necessary temporary absence, he is then, to all intents and purposes of the law, a mine foreman, and as such is held responsible. Both of these constructions cannot be true, however, since if they were, the assistant would be equally responsible with the mine foreman, under all circumstances, and could not therefore be expected to comply with the instructions of the foreman in respect to carrying out the provisions of the act.

Sec. 1 of art. 4 stipulates, first, that "the mine foreman shall have full charge of all the inside workings and of the persons employed therein, in order that all the provisions of this act, so far as they relate to his duties, shall be complied with," and, second, that the assistants "shall act under his [mine foreman's] instructions in carrying out the provisions of this act."

These two provisions, to my mind, establish the preeminence of the foreman both as to his authority and responsibility, and may be logically regarded as emphatically and unequivocally referring all subsequent requirements of the act to his supervision and execution, either personally or by proxy.

In his interpretation of sec. 24, Mr. Hogarth has evidently understood the first construction I mentioned previously and by so doing has overlooked the more comprehensive stipulations of the first portion of the article. In the interpretation and application of a law, the intention of its requirements must be kept in view, and where the phraseology of any particular portion would make that intent obscure or uncertain, its meaning must be derived from those parts that are clear and emphatic. There is neither obscurity nor equivocacy, in the first section of the article, in regard to the authority of the foreman nor in reference to the subordination of the assistant. Bearing this relation to each other under the law, it would be inconsistent with the law's intent to contend they are equally responsible under the act, or to attempt to destroy the meaning and application of one portion by arraying against it another portion of such grammatical construction as to be capable of a misapplication in the practical operation of mines.

It is neither my desire nor intention to engage in a discussion that is of little practical value, but I regard it as the duty of every man in the name of justice to protest against an evident misinterpretation of a law. I have found nothing in the bituminous mine law (1911) that can be construed to make the assistant mine foreman any more or less than a representative of the foreman, and in this respect he occupies the same relative position as the representative of a constituency. In the discharge of his duties, he loses his individuality and becomes the embodiment of another whose will and pleasure he carries out. Therefore, I claim that the acts of the assistant are the acts of the foreman and the assistant cannot be held responsible for another's acts.

In the extract given from art. 19, sec. 13, the important point is to interpret correctly the meaning of the words, "the person or persons at fault." I would like to ask, Would it be just to place the fault on an individual who is acting in an official capacity under the instructions of another? The attempt has been made, both by mine inspectors and foremen, to hold the assistant foremen responsible, and this fear has been held, unlawfully, over the heads of the assistants, thus affording greater facilities for shifting the blame from the legally responsible party.

It would be interesting, in connection with this discussion, to read the decision of Judge W. H. Ruppel in the case of Joseph Willis vs. Commonwealth of Pennsylvania, and to note that in that decision the mine foreman is named as the official to see to the execution of the law, the assistant being referred to only as a delegated authority to carry out his orders.

I. C. Parfitt.

Jerome, Penn.

Study Course in Coal Mining

By J. T. Beard

The Coal Age Pocket Book

THEORETICAL CONSIDERATIONS IN SPLITTING

Theory assumes that when an air current traveling in an airway divides, at a certain point called the "point of split," into two separate currents or "splits," the unit pressure (p) at the point of split is common to each split. In other words, two splits starting from the same point in a mine have the same unit pressure (p) and, for the same sectional area (a), the resistance (R = pa) is the same for each split. The same holds true for any number of splits (n) of equal area.

Whether the unit pressure (p) or the unit work (pv) is the factor common to each of two or more splits starting from the same point will not be discussed here. The law of dynamic equilibrium of fluids points to the equality of unit work for each split. The comparison of the relation of the quantity of air (q), the rubbing surface (s) and the sectional area (a), on these two basis of reasoning, is as follows:

Unit Pressure

$$p = \frac{ksq^2}{a^3}$$

For constant unit pressure:

$$q \text{ varies as } a\sqrt{\frac{a}{s}}$$

Unit Work

$$\frac{u}{a} = \frac{ksq^3}{a^4}$$

For constant unit work:

$$q \text{ varies as } a\sqrt[3]{\frac{a}{s}}$$

Practical Conditions—In considering the practical results of splittng the air current in a mine, it may be assumed that the power on the air (U) at the mouth (intake) of the mine remains constant. Assuming a number of splits (n), starting from the same point in the mine, the total area of passage is na and the formula for power is then

$$U = \frac{ksQ^3}{(na)^3}$$

which shows that, since in any case U, k, s and a are each constant, Q^3 varies as n^3, or Q varies as n, which is the number of equal splits, each having an area a.

In other words, the quantity of air circulated in a given mine, by a given power on the air (effective power), is proportional to the number of splits, assuming the splits all start from the mine entrance or so near to it that the resistance of the main intake entry, slope or shaft may be ignored. Under these conditions, splitting the air has no effect to alter the velocity or the resistance in the mine.

When the point of split, however, is some distance inby from the mouth of the mine or "daylight" the effect of splitting the air, in that case, is to cause a disproportion. The quantity of air circulated by a given power no longer varies as the number of splits; but the ratio of increase in volume is less, because the power on the air at the mouth of the splits is decreased by splitting.

Assuming, as before, a constant power on the air at the mouth of the mine, since the quantity has been increased by splitting, both the velocity and resistance have been increased in the main airway, which absorbs more power thus decreasing the power on the splits.

The Coal Age Pocket Book

Effect of Splitting on Velocity—In order to show the general effect of splitting the air current, at any point in a mine, on the velocity (v_0) in the shaft or main airway and the velocity (v_1) in the splits, it is necessary to know the ratio (m) of the rubbing surface (s_1) in the splits, to that (s_0) in the shaft or main airway; also, the ratio (n) of the area (a_1) of the splits, to that (a_0) of the shaft or main airway.

Then,
$$s_1 = ms_0; \quad \text{and } a_1 = na_9; \qquad (1)$$

and, since for a given quantity the velocity varies inversely as the area,

$$v_1 = \frac{v_0}{n} \qquad (2)$$

But, the power on the air (U) at the mouth of the mine is equal to the power (u_0) absorbed in the shaft or main airway, or both, plus the power (u_1) absorbed in the splits.

$$U = u_0 + u_1 \qquad (3)$$

or, expresed in terms of the mine, since $u = ksv^3$,

$$U = k\,(s_0v_0^3 + s_1v_1^3) \qquad (4)$$

Substituting for s_1 and v_1^3 the values given in equations 1 and 2, gives after simplifying

$$U = ks_0v_0^3\left(1 + \frac{m}{n^3}\right) = ks_0v_0^3\left(\frac{n^3 + m}{n^3}\right) \qquad (5)$$

Equation 5 shows clearly that, for a constant power on the air at the mouth of a mine, in splitting,

$$v_0 \text{ varies as } \frac{n}{\sqrt[3]{n^3 + m}} \qquad (6)$$

and, observing equation 2,

$$v_1 \text{ varies as } \frac{1}{\sqrt[3]{n^3 + m}} \qquad (7)$$

It appears from the last three equations that as the ratio of the split area to the shaft or main-intake area, represented by n, is increased the main-intake velocity (v_0) is increased, while the split velocity (v_1) is decreased, the increase and decrease of velocity, however, being less rapid than the change in the area ratio.

Effect of Spliting on Quantity—The quantity of air in circulation varies directly as the intake velocity v_0; or, for a constant power (U) on the air,

$$Q \text{ varies as } \frac{n}{\sqrt[3]{n^3 + m}} \qquad (8)$$

Effect of Splitting on the Mine Resistance—The total mine resistanec is the sum of the main-intake and split resistances.

Thus,
$$R = k\,(s_0v_0^2 + s_1v_1^2) \qquad (9)$$

and
$$R = ks_0v_0^2\left(\frac{n^2 + m}{n^2}\right) \qquad (10)$$

Finally, from equations 6 and 10 is derived

$$R \text{ varies as } \frac{n^2 + m}{\sqrt[3]{(n^3 + m)^2}} \qquad (11)$$

Inquiries of General Interest

Efficiency of Mine Fans

Will you kindly explain why there is such a great difference in the observed efficiencies of ventilating fans in mining practice. The initial depression, for any tip speed u, as expressed in inches of water gage, is commonly calculated by the formula

$$w.g. = \frac{1.2 \times 12}{1000} \times \frac{u^2}{g}$$

I have observed that the use of this formula gives widely different results in fans of the same size and operated at the same speed. How should the efficiency of these fans be calculated for comparison.

MINING ENGINEER.

Chicago, Ill.

There are two methods of estimating efficiency that have been more or less prevalent in fan practice. The earlier practice was to estimate the efficiency as the ratio of the actual gage in the fan drift to the theoretical gage as calculated by the formula given by correspondent, reducing this ratio to percentage by multiplying by 100. Later practice, however, quite generally bases the efficiency of a ventilator on the ratio of the power on the air, as measured in the fan drift, to the indicated horsepower of the engine driving the fan, as calculated from the indicator card.

In regard to the first method mentioned, it has been generally recognized that the water gage developed by the operation of the fan is not a true factor of the fan itself, since it is modified—indeed, we may say established, by the resistance of the mine against which a given fan driven at a given speed will produce a volume of air that will be greater or less according as the resisting pressure is less or greater. In other words, the action of the fan must be measured by both the volume and the pressure, since the one increases as the other decreases, for the same speed of the fan. It is evident, therefore, that the same operation of the fan may develop a higher or a lower pressure, depending on the resisting power of the mine or airway, which obstructs the flow of the air current, both in the mine and through the fan. This conclusion shows that the "manometric efficiency" permits of a true comparison of fans only when operating against the same mine resistance, and this explains in part the wide difference in the efficiencies of like fans operated at a like speed, but under different conditions.

In this connection there is another important consideration affecting the efficiency of centrifugal ventilators. For example, when a fan is operated against a less resistance than that for which it was designed, a heavy burden is thrown on the fan by reason of the increased quantity of air that rushes through it as a result of the low resistance against which the fan is working. Assuming that the total power operating the fan is unchanged, a larger proportion of this power is then absorbed in the fan itself and a less proportion of the power is effective in the mine, and the efficiency, which is the ratio of the effective power to the total power producing circulation, is rapidly decreased. Calling the efficiency K, if a total power U produces a quantity of air Q against a unit pressure p, we have

$$U = \frac{Qp}{K}$$

Now, practically, the power required to turn the fan varies as its speed of rotation, or the number (n) of revolutions per minute; and it has been too generally assumed that the quantity of air in circulation varies as the speed of the fan. This would be true if the pressure p varied as the efficiency K, which is not the case. A large number of experiments show that the efficiency varies as the $\frac{7}{8}$ power of the pressure against which the fan operates. Then, since the pressure varies as the square of the quantity of air in circulation, it follows that the speed of rotation varies as the $^5/_4$ power of the quantity of air in circulation, or the fourth power of the speed varies as the fifth power of the quantity.

The practical conclusion to be drawn from the relation thus found to exist between the power, speed and efficiency of the fan and the quantity and pressure of air in circulation is shown as follows: Assuming a constant power applied to the fan shaft, resulting in a practically constant speed of the fan,

$$Q \text{ varies as } \frac{K}{p}$$

Any change in ventilating pressure, owing to a change in the mine resistance, is accompanied by a similar though less rapid change in the efficiency of the fan. Consequently, there is always a loss of efficiency when a centrifugal ventilator is operated at a lower pressure than that for which it is designed; and, *vice versa*, there is always a gain in efficiency when a fan is operated at a higher pressure than that for which it is designed. These remarks refer to changes occurring in the mine or airway, with a constant power applied to the fan shaft.

On the other hand, assuming the conditions in the mine or airway remain unchanged, any increase or decrease in the power applied to the fan shaft is accompanied by a nearly proportionate increase or decrease in the speed of the fan, resulting in a similar, but not proportionate, change in the quantity and pressure of the air in circulation. In this case, since, practically,

$$K \text{ varies as } \frac{Qp}{n}$$

it follows if p varies as Q^2, and Q varies as the $\frac{4}{5}$ power of n, the efficiency varies as the $^7/_5$ power of the speed, or the fifth power of the efficiency varies as the seventh power of the speed. This shows that there is a gain in efficiency when a fan is operated at a greater speed than that for which it is designed, assuming the conditions in the mine remain unchanged. Likewise, there is a loss in efficiency when the fan is operated at a less speed than what that for which it is designed.

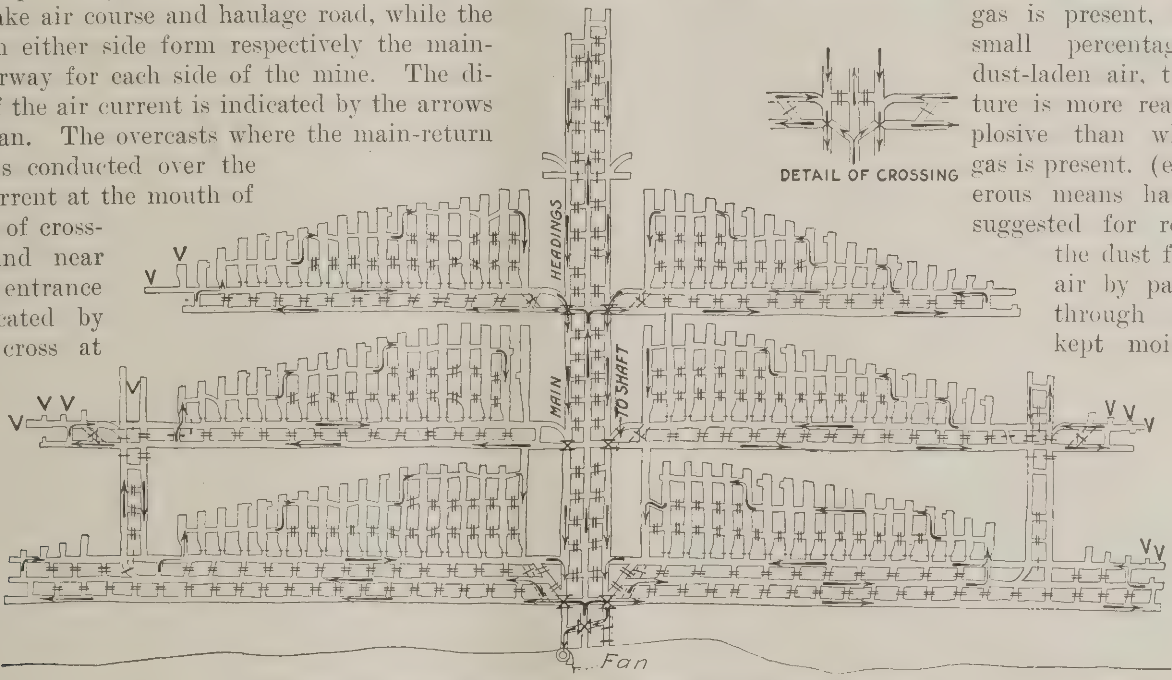
Examination Questions

Some West Virginia Questions

(Answered by Request)

Ques.—Show on the accompanying plan where the fan should be located and indicate the proper method of ventilation by means of arrows, showing the position of overcasts, doors, stoppings and regulators by means of the usual symbols. Note any violation of the mine law by the letter *V* on the plan.

Ans.—So many requests have been received relating to this question that we reproduce the plan of mine published in a former issue of *Coal Age*. The letter *V* indicates where rooms have been turned inside of crosscuts or where headings have been driven a greater distance than the 80 ft. specified in the mine law. The location of the fan is as indicated. This mine is opened on the triple-entry system, the center entry being its main intake air course and haulage road, while the entries on either side form respectively the main-return airway for each side of the mine. The direction of the air current is indicated by the arrows on the plan. The overcasts where the main-return current is conducted over the intake current at the mouth of each pair of cross-entries and near the mine entrance are indicated by a large cross at those points. Stoppings are indicated by a double line and doors by a single line crossing the heading or passageway, while regulators are indicated by a broken line across the heading. The general arrangement of the air crossings is shown in detail just above and at the right of the general plan.



SHOWING DEVELOPMENT OF A WEST VIRGINIA MINE

Ques.—(a) Is coal dust explosive? (b) If so, where are explosions of coal dust most likely to occur? (c) What weight of dust in air makes an explosive mixture? (d) What weight of dust and what percentage of marsh gas will make an explosive mixture? (e) What means have been proposed to remove coal dust from the air? (f) What method has been found most successful for purging the air of coal dust? (g) Is it best to prevent the suspension of coal dust in air or to remove the dust after it has been suspended?

Ans.—(a) Yes, under favorable conditions. (b) Coal-dust explosions are most likely to occur in dry and dusty mines, especially where a small percentage of marsh gas is present and where black powder is used for blasting the coal and suitable precautions are not taken to avoid excessive charges of powder and badly located shots.

(c) The weight of dust required to form an explosive mixture in air free from gas depends, to a large extent, on the inflammability and fineness of the dust. Experiments performed at Pittsburgh on fine bituminous dust that has been passed through a 200-mesh sieve produced explosions when the density of the dust-laden air was 1 lb. of dust per 500 cu.ft. of air, while other experiments at Liévin, France, showed explosions to take place when there was 1 lb. of dust to 230 cu.ft. of air.

(d) Marsh gas and dust without the addition of air would not form an explosive mixture; but when marsh gas is present, even in small percentages, in dust-laden air, the mixture is more readily explosive than when no gas is present. (e) Numerous means have been suggested for removing the dust from the air by passing it through curtains kept moist with water, or by sprays of water thrown across the entry through which the air is passing; also, by alternating the width of the airway, so as to cause a reduction of velocity at intervals where the dust would fall.

(f) The most effective means of purging the air from dust is to prevent its being thrown into suspension in the air current, by avoiding the accumulation of dust at the working face and the use of heavy charges in blasting. All fine coal and dust should be loaded out of the mine in dustproof cars, and the working face should be thoroughly watered before firing shots.

(g) Since an ounce of prevention is worth a pound of cure, it is better to use every precaution to prevent the suspension of dust in mine air, but means must also be adopted for the removal of dust that it is impossible to prevent getting into the air.

Coal and Coke News

Washington, D. C.

Sufficient time has now elapsed since the handing down of the decision of the Interstate Commerce Commission in the anthracite cases to permit the expression of some more definite opinions regarding it both by coal and railroad interests. Taken in conjunction with the decision in the matter of rates governing the transportation of railroad fuel and that regarding the rates to be charged for commodities generally by the Western roads, this opinion is regarded by competent students as the most important act of the commission for a long time in determining the relations between the carriers and the coal companies.

It is of course generally admitted that the significance of the decision is quite materially diminished by the fact that there is such an intimate relationship between the carriers and the producing mines in the anthracite region. That being the case, the decision is not regarded as of direct and fundamental importance to consumers or even, in the main, to miners as such, because of the almost complete identity between the anthracite roads and the coal-mining companies.

Should the commodities clause be so applied as to bring about a real separation between the mines and the carriers the effect of the anthracite decision will be considerably more practical and more marked. It will then be apparent what the result of a reduction in the charge for transportation will be in affecting the price of coal to the consumer. Meantime, it is noted that the commission itself seems to concede in the opinion that the verdict is of chief practcal importance to the producers of about 20 per cent. of the anthracite output who are supposed to be "independent."

The essence of the decision in the anthracite case is seen in the methods it employs for the determination of a reasonable rate for the carriage of freight. With due limitation it is assumed throughout the opinion that the coal furnishes practically the staple busines of the anthracite roads (a tabular view shows that it runs to one-half or more of all freight), so that in speaking of income from the transportation of coal reference is made to (substantially) the chief income of the carriers.

The Inherent Unlawfulness of Rates

The point of the opinion is then seen in the statement that ". . . We are impressed with the inherent unlawfulness of the rates and practices established by these carriers, which clearly are the outgrowth of past conditions wherein the carriers were producers, shippers, transporters and vendors of the commodity. If the rates they established for transportation were excessive it resulted in no hardship to their mining and selling operations because the excessive profits from the transportation services offset the absence of profit in their mining and selling operations. And high rates eliminated the competing shipper from the markets."

This conclusion is arrived at after an analysis of the conditions of capitalization and operation of each of the carriers involved, with remarks regarding the relations between each carrier and the coal-mining industry along the route or as controlled by the carrier in question. A curious feature of the decision is found in the fact that despite this criticism of the methods pursued in the past when the operations of mining and transporting were admittedly in the same hands. The commission goes on to say that the coal companies now controlled by the carriers "ship 80 per cent. of the total production, and if a substantial reduction is made in the tariff rates its full effect will fall upon but 20 per cent. of the tonnage shipped"—a remark which appears to imply that, in spite of all that has been attempted to the contrary, the same kind of control that has prevailed in the past will be expected to continue in the future.

Financially the exact effect of the decision is considered not easy to trace. The reductions ordered range from 15 to 50c. per ton, but without knowing the tonnage moving to various points at each of the newly fixed rates, an exact computation of the resultant loss of income is out of the question. Possibly the most significant financial aspect of the opinion is found in the computation of cost of transportation on anthracite coal per ton of 2000 lb. per mile as 3.3 mills, while average revnue on the coal roads is given as follows:

	Average Haul	Average Revenue per Ton Mile
Central R.R. Co. of New Jersey...	140.58 miles	9.45 mills
Lehigh Valley R.R. Co..........	157 miles	9.44 mills
New York, Ontario & West. Ry. Co.	209 miles	6.18 mills
Erie R.R. Co....................	169.90 miles	7.39 mills
Philadelphia & Reading Ry. Co...	185.70 miles	6.44 mills
Delaware, Lack. & West. R.R. Co.	147 miles	7.90 mills
Pennsylvania R.R. Co...........	221.43 miles	5.43 mills

Deducting the stated cost of transportation 3.3 mills per mile from the figures in the last column shows an alleged "margin of profit on tidewater anthracite" varying from something over 2.1 mills to something over 6.1 mills per ton-mile. It seems plain that the cut of 15 to 50c. per ton, equal perhaps to an average cut of 10 to 15 per cent. in haulage charges, is not expected to materially affect the revenues thought by the commission to be realized at present even if there should be no growth in density of traffic as a result of the reduction.

In some respects the most interesting phase of the opinion is thought to be seen in the remarks of the commission regarding the "practices" of the coal roads. Several of them are said to be still practicing what amounts to discrimination by granting the exclusive use of some of their piers, docks, storage plants, retail delivery trestles and other properties to their allied coal companies at inadequate rental charges and under conditions which constitute substantial discrimination in favor of such coal shippers, while several are alleged to have declined to establish joint rates for all shippers notwithstanding the coal output of their allied companies has been accorded an interline movement by means of trackage arrangements and the free transportation to junction points of the coal production exchanged by the coal companies controlled by the carriers.

Such practices are criticized as unlawful and discriminatory in the worst sense, since the discriminaton results to the benefit of the carriers. On the whole the action of the commission in ordering the abolition of these practices and the establishment of through routes and joint rates is thought by many to be the most decided feature of the opinion, if they should, as the commission predicts, have the effect to "neutralize any . . . undue benefit heretofore enjoyed by the coal operations of railroad ownership."

The Railway Fuel-Coal Decision

Considerable interest is likewise expressed in the decision of the commission regarding the practices governing the transportation of fuel-coal for railways rendered at about the same time as the general anthracite decision. This case, it will be recalled, was instituted because the commission's attention had been directed at various times to the method of handling railroad fuel-coal in vogue in Southeastern territory.

The fuel-coal in question, as is now brought out, is purchased f.o.b. the mines, and the factors taken into consideration in letting the contracts were (1) the price of coal at the mine mouth, (2) the division of the joint through rate which issued to the originating carrier, and (3) the cost of transporting the coal from the junction points to the points of consumption.

After considering the evidence in the case the commission reaches the conclusion that "one of the determining features if not the controlling one is the divsion of the joint through rates which must be paid to the originating carriers." The commission adds that "in order to intelligently bid for the coal contract it is necessary that the competing operators shall know definitely the amount of this division. While in ordinary commercial business the through rate to be paid for transportation is the important factor, here the essential factor is the division of the through rate paid up to the junction. For this reason all the facts and circumstances which make it desirable that the exact rate of transportation on commercial shipments shall be published make it desirable that the divisions of the rates under which railway fuel coal is transported be published."

On the strength of this reasoning the commission announced a determination to treat the railway fuel-coal like other coal moving over the lines. From this it follows that a railroad company when acting as shipper is entitled to the same consideration as a commercial shipper, and no more, even when the shipment moves in part over the rails of such a company.

In such cases the carrier is held to be entitled to a division of the joint through rate, such rate, however, having been fixed by the same considerations which would determine divisions upon a through commercial shipment in which the railroad had no interest other than that of carrier. For the future the divisions of rates in the case of fuel-coal over the roads involved in the controversy or inquiry are to be fixed by the commission and to be filed with it as in the case of other rates.

HARRISBURG, PENN.

The fifth annual reports of the Mining Institutes in the anthracite region, which are conducting mining schools at night, under the direct control of the public school boards have just been completed by the presidents and secretaries of these Mining Institutes, and have been compiled and arranged in a comprehensive and combined report by Charles K. Gloman, chief clerk of the Susquehanna Coal Co., Wilkes-Barre. This report has been made public by the companies which have taken an especial interest in this work.

This is the second season of direct control by the public school boards and of direct coöperation by the State Department of Public Instruction, with the continued moral and financial support of the operating coal companies, the wisdom of this method of control has been amply proved.

With advisory committees representing both the employers and employees to coöperate with the public school authorities the three elements are united which assures the present and future success of the schools. The needs of the employee and the needs of the employer are thus combined with the knowledge and experience of the educational experts. The best proof of the success of this combination is that 11 of the students passed the state examinations for mine foremen and 44 students passed the state examinations for assistant mine foremen this year, and the total number of students has increased enormously.

There were 2500 students enrolled in the schools of the Nanticoke Mining Institute, the Shamokin and Mt. Carmel Mining Institute and the Williams Valley Mining Institute in the season which ended this spring. The following table shows the remarkable growth of the first two institutes and their schools since they were founded in 1910:

	Nanticoke Institute	
	Members	Students
1910-1911	500	100
1911-1912	501	128
1912-1913	679	637
1913-1914	821	841
1914-1915	928	1269

	Shamokin and Mt. Carmel Institute	
	Members	Students
1910-1911	108	25
1911-1912	254	56
1912-1913	571	763
1913-1914	761	1016
1914-1915	1073	1052

In addition to this the Williams Valley Institute which has just completed its second year, had 295 members and 242 students.

It is not only the men who are instructed in the rudiments and the technical subjects which pertain to mining. During five months of the last season, Mrs. Anna Snyder Lape was employed by the Nanticoke Mining Institute as field secretary for the sewing classes for married women and employed girls. The last month of her time was devoted to a canvass of the houses in the community and she secured no less than 559 applications from women to attend the night school classes in sewing, cooking and English this Fall.

These schools conducted by the Mining Institutes under the direction and authority of the local school boards aided by the State Department of Public Instruction have the hearty support and coöperation of the coal companies whose employees attend them. In the Nanticoke district the Susuehanna Coal Co., the Delaware, Lackawanna & Western Coal Co., the Lehigh & Wilkes-Barre Coal Co., and the Alden Coal Co., are their supporters. In the Shamokin and Mt. Carmel district the companies interested are the Susquehanna Coal Co. and the Philadelphia & Reading Coal & Iron Co. The majority of the students at the Williams Valley Institute schools are employees of the Susquehanna Coal Co.

Similar night schools have been conducted in the boroughs of Plymouth and Shickshinny under the local school board auspices only.

PENNSYLVANIA

Anthracite

Scranton—Suits for coal royalties aggregating $328,906 were commenced against the Lackawanna coal company on August 26, on behalf of the Winton Coal Co. and the heirs of the Anderson, Dean and Livery estates. The money is alleged to be owing for coal mined from beneath portions of the city since 1871. One phase of the case is the request for $50,000 for culm that has been sold by the company after having been washed, the original lease not having taken the small sizes of coal into consideration.

Several houses within the city limits and over workings of the Lackawanna Coal Co. were badly damaged recently by a cave-in. In all five buildings suffered by having foundation walls cracked, the most badly injured building being an apartment house in which six families lived.

Parsons—Thousands of tons of coal are being stocked by the Delaware & Hudson Co. in the large tract of land opposite Hollenback Park. Rumor had it that the company was stocking coal in the event of a strike on Apr. 1 next, but this contention is denied. The coal officials state that stocked coal is subject to taxation in New York state and that the company has transferred its stocking plants to this state.

Mauch Chunk—Due to the numerous floods in the Lehigh River this summer a greater quantity of coal than for some years has been washed down and as a conseuence the river dredgers are more than usually active. About three cars of coal of good quality is being taken daily from the river at this point.

Beaver Meadow—The miners in the Evans Colliery, to the number of 200, went on strike when one of their members was fined by the foreman. After being out 5 days the difficulty was adjusted by the owners of the mine.

Nesquehoning—It has been a good many years since the collieries in this region have experienced so much trouble with water in the workings. While the collieries at this place have been gotten into workable condition, all the other collieries in the Panther Creek Valley are still badly flooded.

Shenandoah—A new bed of coal, over 30 ft. thick, has been discovered in the workings of the Philadelphia & Reading Coal & Iron Co. The present indications are that the vein extends for several miles along the mountain and is of such a size as to insure work for the inhabitants of this place for many years. It will not be necessary to erect a new breaker to take care of the new output, as its proximity to Shenandoah colliery is such that it can be taken care of by that plant without any difficulty.

Pottsville—The rainfall in the anthracite region this season has been almost without precedent as to volume. In six weeks almost 16 in. have fallen and as a conseuence the mines in many instances have been flooded, even with the pumps working to full capacity. As a result it has been impossible to work the lower measures, and in one instance in the Gilberton colliery the water attained a depth of 70 ft. Ordinarily in summer the seepage from the roofs practically ceases, but this year the men are compelled to endure the wet conditions in all parts of the mines.

No recent order of the Philadelphia & Reading Coal & Iron Co. has caused so much comment as the one canceling the vacation privilege of the salaried employees. This company had formerly granted a 10-day vacation to its salaried men with transportation over the lines of the Reading system. With the coming of the vacation period this year the men were notified that not only was the transportation order annulled but the vacation privilege with pay had also been abolished. The new order is causing a great volume of comment among mining men all over the Schuylkill field.

Bituminous

Connellsville—The shipment of coke from the Connellsville region recently broke the year's record amounting to 393,000 tons. This practically cleared all the yards of spot coke. The region is now operating 75 per cent. of its ovens to 95 per cent. of their capacity.

Bakerton—The mines in Bakerton and vicinity are now working full time, all the miners being busy. It is believed that this state of affairs will continue throughout the balance of the year.

Galitzin—The Birds Eye mine is being cleaned out. The operators have not stated whether the mine will be worked immediately or otherwise, but it has been reported that work will be resumed this summer.

Monongahela—More than a dozen coal mines in this valley have doubled their working forces and production in the last 10 days, and production is now at a higher rate than at any time this year. It is stated that this state of affairs is due to the fact that the railroads have decided to store enormous quantities of coal in anticipation of a shortage, because of the export demand and the threatened labor famine. Over 3500 men have been added to the payrolls in this valley.

Uniontown—Reports to the effect that H. V. Thompson, whose too extensive transactions in coal lands were responsible for the closing of the First National Bank of which he was the president, here early in the present year, is about to emerge from his period of financial difficulties are given considerable attention, inasmuch as it is reported that he is already paying off numerous notes, the past due interest on others and that numerous judgments that have been entered in the past few months are being stricken from the records.

An order increasing the output of the three plants of the Oliver and Snyder Steel Co., near here, from 30,000 to 40,000 tons monthly has been received and will speed the additional tonnage, General Superintendent J. H. Lane will put the plants on a 6-day working basis and employ a full complement of men, about 700 in all. Ever since the shift to the upward tendency in the coal and coke market the Oliver plants have been running 5 days a week, adding weekly to the working force until now they are ready to start full time operations with almost a full payroll. A few more men will be required, however. The output will be consigned direct to the company's steel plants at Pittsburgh.

Punxsutawney—A coal deal involving nearly 5000 acres was closed on August 29, between the Rochester & Pittsburgh Coal Co. and the Buffalo & Susquehanna Coal & Coke Co., two of the largest operating corporations in the bituminous coal region. For 2019 acres of coal in Jefferson, Clearfield and Armstrong counties the Rochester & Pittsburgh Co. has traded to the Buffalo & Susquehanna company a slightly larger acreage in Indiana County in the White Bush Flats region. About 1200 acres in Armstrong county, which the Buffalo & Susquehanna company had planned to mine through a new opening, will now be mined through the Cowanshannock Coal & Coke Co.'s opening at Numine. By the deal the Rochester & Pittsburgh company has lengthened the life of its Adrian operations 4 years, its Helvetia mines 6 years and its Numine workings nearly 20 years. The life of the Sagamore mine, of the Buffalo & Susquehanna Coal & Coke Co., has been increased at least 30 years.

WEST VIRGINIA

Glendale—The Hitchman Coal Co.'s mine north of Glendale has been closed for a short time in order that extensive repairs may be made. Improvements will be made in the fans and in the scales, the shutdown being merely temporary.

Charleston—All the coal mines located along the Little Coal River between Sovereign and Clothier are being operated full time with a full force of men. Nine mines are located between these two towns, and it is said that the operators have sufficient orders on hand to keep them busy for several months.

Hinton—The Miller-Pocahontas Coal Co. recently shipped its first carload of coal. Development of the property was begun Apr. 15 last, and the promoters are congratulating themselves on their rapid progress. This firm has 1083 acres of Pocahontas No. 3 coal on the Gugan River near Mullins.

ALABAMA

Birmingham—A substitute was adopted for the convict bill in the legislature, following an agreement of both sides. The bill provides that no convict of any class shall be worked in the mines of Alabama after Jan. 1, 1920, and no convict under sentence of less than five years shall be worked in the mines after Jan. 1, 1918. There has been a long fight over this bill.

It is understood that application will be made to the Board of City Commissioners by the Sloss-Sheffield Steel & Iron Co. for the relighting of the bee-hive ovens located near the Sloss furnace on First Avenue. Two years ago the city entered into a contract with the Sloss company, whereby in consideration of the city vacating in favor of the company certain parts of Third Avenue and nearby alleys, and withdrawing several damage suits, the Sloss company discontinued the operation of the coke ovens, which have been idle since Jan. 1, 1914. With the present demand for iron, the company is facing a shortage of coke, and it is understood will make application to the city to be allowed to relight the ovens until the rush of orders is completed.

KENTUCKY

Providence—Forty-seven men have been attending the miner's course which is being conducted at Providence by T. J. Barr, professor of mining engineering at the Kentucky State University. Mining, drainage, ventilation, machinery, fires, etc., were covered.

Frankfort—Clay and Jackson counties, Ky., have organized forest protective societies, 50,000 acres being included in the latter county. Lee Craft is president and S. G. Coons secretary of the Clay County Association and Joseph Tussy is president and W. R. Reynolds secretary of the Jackson Association.

Hazard—The Kentucky River Power Co., organized to furnish power to the numerous mining operations in this section has let contracts for clearing the rights of way and erecting poles along them. R. L. Cornell, general manager in charge of the work, and George Johns, foreman of construction, have moved their families to Hazard.

OHIO

Gaylord—The Gaylord No. 2 mine of the Pittsburgh & Cleveland Coal Co. will resume operation shortly at a little over half time. A considerable force of men was recently put to work cleaning up this mine. When started, this operation will employ about 100 men, and after running for a short time, a force of probably 175 men will be employed.

Athens—A gas explosion in Mine No. 6 of the Poston Consolidated Coal Co. near Athens caused a bad fire recently. The blaze was discovered early in the morning and after the local department tried unsuccessfully to stop the blaze the Ohio mining department was notified. The mine was sealed up to burn itself out. It will not be opened for several months.

Conesville—Barnes Mine No. 1, which has been closed down for more than two months for repairs to the tipple has again been placed in operation.

INDIANA

Terr Haute—The officers of district No. 11 U. M W. A. have ordered the closing down of three mines at Bloomsville which have been run on a coöperative plan. It is said that under the agreement between the owners of the mines and the miners the latter could not make as much as if employed under the union scale. The mines are the Menden, Caledonian No. 3 and the John Bull.

ILLINOIS

Monmouth—It is reported that the plant of the Monmouth Mining & Manufacturing Co. will be sold Thursday, Sept. 9, by Refere in Bankruptcy E. U. Henry at Peoria. It is believed that the James Green & Son Co. of Chicago will be the only bidder. The plant is in such shape that it could be started as soon as the new owners assumed charge. It is not thought, however, that operations will be begun before the latter part of September.

Belleville—Fire of unknown origin destroyed the fan house of the Oak Hill mine, near here, recently. The loss is several thousand dollars. The mine belongs to the Southern Coal, Coke & Mining Co.

Damage was done to a number of St. Clair County coal mines by floods during the past week. The airshaft of the Oakdale mine, owned by the Oakdale Coal & Mining Co., was flooded, necessitating a close down for five days. The same thing happened at the Suburban mine, which was idle for several days. Washouts on the Big Four, Vandalia, Southern, Baltimore & Ohio, Louisville & Nashville and Illinois Central railroads prevented shipments from this and adjoining counties and caused losses to the coal men, who were unable to fill orders. Normal conditions have been restored.

Pocahontas—Operations have been resumed at the mine of the Pocahontas Coal Mining Co. The mine had been closed down since last October. It employs 250 men.

Edwardsville—Farmers of Madison County who have lost their wheat and corn crops by rain and flood are planning to dig coal this winter in an effort to recoup their losses. In Foster township, particularly, there is a bed of coal of considerable thickness only a few feet beneath the surface. Few attempts have been made to mine it up to this time because the farmers could occupy themselves more profitably with their crops.

COLORADO

Denver—The Union Pacific and the Colorado & Southern railroads have appealed to the state supreme court for a review of recent rulings of the state pubic utilities commission regarding freight rates on coal, requesting that these rates be modified. Attorneys for the railroad companies assert that the new rates "are discriminatory and confiscatory" and that, if necessary, the cases will be carried to the United States Supreme court. If the state court should decide for the roads, appeal will be made for similar consideration of the new passenger schedules.

PERSONALS

George Watkin Evans is at present on a professional visit to Alaska.

C. A. Dorsey was elected trustee at a recent meeting of the creditors of the Wadsworth-Cahaba Coal Co. bankrupt.

Jacques Negru, technical chemist, Denver, has accepted a position with the Utah Fuel Co. and will have full charge of coking operations at Sunnyside, Utah.

G. A. Luckenbach, 1637 Jefferson Ave., Scranton, Penn., has been appointed factory representative in the anthracite field for the Koehler Co., Marlboro, Mass.

Walter E. Guller, formerly chief engineer of the Consolidated Indiana Coal Co., was recently appointed superintendent by the receiver for that company to succeed. J. R. Sharp, resigned.

A. R. Beisel, formerly superintendent of the Holden Mines of the United States Coal & Oil Co., has been appointed general manager of that firm, with offices at Stone, Ky.

E. J. Knickerbocker, assistant to the vice-president, was recently promoted to the duties of first assistant general sales agent, coal department of the Central Coal & Coke Co., Kansas City Mo., vice A. P. Moore, resigned.

Gustav Boehmer, president of the Boehmer Coal Co., of St. Louis, Mo., who had been in ill health for a year past, went to Lake Minnetonka six weeks ago. In a letter to his son, Will Boehmer, he says he is feeling fine and goes rowing every day although he is 67 years old.

Charles S. Snyder, for some years representative of the Buffalo & Susquehanna Coal & Coke Co., in central New York, with headquarters at Syracuse has taken a similar position with the Lehigh Valley Coal Sales Co. The vacancy has been filled by the appointment of H. S. Bradfield, of Buffalo.

Tom L. Lewis, formerly president of the United Mine Workers of America and later owner and editor of the Coal Mining Review in Columbus has been appointed secretary of the High Volatile Coal Operators' association of West Virginia. He will make Charleston, W. Va., his headquarters.

Hon. James E. Roderick, chief of department of mines of Pennsylvania, on Aug. 25 appointed C. H. Crocker, of Johnstown and Patrick S. King, of Smithfield to be inspectors of mines in the Bituminous region. Mr. Crocker will have headquarters at Blairsville and Mr. King in Freeport, they will take office on Sept. 15, 1915.

W. E. Mathews, for two years superintendent of the Mount Braddock plant of the W. J. Rainey Co., has resigned on account of ill health. D. K. Dillworth, chief clerk at the plant, is now acting as superintendent. For the present Mr. Mathews will remain at his home in Uniontown, Penn.

OBITUARY

W. C. Hill a prominent coal mine operator at Blanche, Cherokee County, Ala., was found dead in bed recently, dying from heart failure.

William Krumlauf, aged 62 a well known coal operator died at Alliance, Ohio, recently after an illness of several weeks.

Morgan Davis, Jr., aged 48 years, one of the foremost mining engineers in the anthracite region and a successful mine promoter, died Aug. 25, in a Scranton private hospital following 6 weeks illness of blood poisoning and pneumonia. He was a native of Mt. Carmel and a graduate of Lehigh University. Mr. Davis came to Scranton in 1895 to take charge of a department of the "Colliery Engineer," but later became a promotor of coal mining companies. The European war prevented the completion of a plan for consolidating a number of West Virginia coal mining companies whereby English capitalists were to found a fifty million dollar corporation, under Mr. Davis's management.

INDUSTRIAL NEWS

Pittsburgh, Penn.—The Goyne Steam Pump Co., of Ashland, Penn., is now represented in western Pennsylvania, eastern Ohio and West Virginia by the Harris Pump & Supply Co., 320-22 Second Ave., Pittsburgh, Penn.

Chicago, Ill.— The Gifford Wood Co. recently moved its office to the Sharples Building, in which it now occupies the entire second floor. This firm now has desirable office quarters and larger room for carrying and displaying its stock of machinery and tools.

Martins Ferry, Ohio—The Rail & River coal mine No. 1 recently broke its record for output for one day by putting out 2500 tons of coal. It also broke another record in working five days during the week. At this mine the coal is transported underground about three miles.

Huntington, W. Va.—Five million tons of coal held up in the Kanawha River awaiting a favorable stage was recently started southward. The majority of this shipment was to Cincinnati. The completion of lock and dam 28, aided by a rise in the river, made the shipment possible.

San Francisco, Calif.—A contract has just been closed for the erection in Honolulu of the largest vessel coaling plant on the Pacific, with the exception of the one at the Panama Canal. The plant will have a capacity of 165,000 tons and the contract price is $1,000,000, and will be built for the Inter-Island Navigation Co.

Pottsville, Penn.—The Philadelphia & Reading Ry. Co. recently started placing additional sidings adjoining the trackage at the coal dock at Palo Alto. The purpose is to store approximately 5000 tons of bituminous coal against the contingency of a strike in the hard coal regions next spring. Two thousand four hundred tons of coal are already stored on the dock.

Boston, Mass.—The rumored sale of the Garfield Proctor Coal Co. wharf at New Bedford, Mass., to the Pocahontas Fuel Co., and recent negotiations for a site at Portland, Me., by the same company are developments that are being watched with some interest. On the surface it looks as if some of the established houses would have a formidable competitor for inland tonnage.

Philadelphia, Penn.—A record freight rate for carrying coal will be paid to the Danish steamship "Gurre." This vessel has been chartered to carry a cargo of 3000 tons to Coquimbo, Chile, for which she will receive $12 per ton, or nearly $40,000, which is about one-third the value of the vessel. The coal, which is bituminous, brings about $1.50 f.o.b. mines. The consignees, however, will pay nearly $20 a ton.

Charleston, W. Va.—July established a coal tonnage record for the Norfolk & Western R.R., the tonnage for that month surpassing that of June by 173,980 tons. During July this road hauled 2,854,445 tons, as compared with 2,680,465 tons in June, which was up to that time the largest month's traffic in the history of the road. It is firmly believed by railroad officials and mining men that the record for August will considerably exceed that of July, and that the 3,000,000-ton mark is not far distant.

Buffalo, N. Y.—There is a move to induce the coal roads to place a charge of $2 on all cars reconsigned in transit. Some of the leading mine owners are asking it and it is believed that all will join in the request when it is understood. This will cut off the shipping of cars in quantity to various parts of the country unsold and oblige the mines to hold their coal back till there are orders for it. It always happens when the market runs dull that certain mines will flood the country with consignment coal in order to keep running. This ruins what firmness there may be left and sets consumers to waiting for coal under demurrage.

New Orleans, La.—It is considered a matter of some doubt, in general industrial and transportation circles here, whether the railroads will profit by the ruling of the Interstate Commerce Commission, and increase the coal rate from Alabama fields, from $1.25 to $1.40 per ton. The decision of the commission denied the carriers the right to maintain the $1.25 rate on bunker coal, and made the order applicable only on a general advance including both bunker coal and coal for city delivery. If the railroads advance the bunker rate 15c. per ton, they will lose the business of harbor delivery to the Pittsburg fields through river competition. In recent contracts signed by local coal dealers, the latter invariably stipulate the purchaser has to pay the increased rate in the event that the roads follow the ruling of the commission.

Charleston, S. C.—Announcement was made recently from the offices of R. L. McKeller, assistant freight traffic manager of the Southern Ry., that the modern export coal-handling plant which has just been completed at Charleston, and which will give the Southern facilities unexcelled for the handling of coal, will be opened shortly. In view of the great demand for export coal from this country, the completion of the handling plant is regarded as particularly auspicious. Millions have been expended in building the plant, providing a storage yard of 400-car capacity and making additions to passing tracks along the Southern lines over which the coal will pass. The Charleston terminal will have a capacity of 40 cars, or 2000 tons an hour, which is said to be as fast as any ship now in the coal carrying trade can take the coal. It will be operated entirely by electricity and will deliver coal into the holds of the ships with a minimum of breakage by means of an electric conveyor.

Coal Trade Reviews

General Review

Tendency to hold closer to the circular in the anthracite trade. Incipient car shortage developing in the bituminous regions. Deadlock in British labor negotiations creates renewed interest in export trade. Reports generally more optomistic.

Anthracite—Most forehanded buyers concluded their purchases at the lower prices prevailing earlier in the season and the final addition to the company's circular, bringing quotations up to the full winter schedule, developed scarcely any last-minute buying. On the other hand, orders have been substantially less than normal throughout the summer, while the recent unseasonably cool weather has served to stimulate interest in the market, and there is a notably stiffer tone to the anthracite situation. The season opened with a better feeling in hard coal circles than for a long time and, while there is still plenty of coal available at concessions on the regular circular, there is a well-defined tendency noted in all quarters to get closer to these figures. The light buying among consumers for storage purposes throughout the summer, and the fact that the large companies are accumulating unusually heavy stocks, indicate an exceedingly healthy condition in the anthracite trade.

Eastern Bituminous—A shortage of labor and a restricted car supply, the first indicia of an active coal market, are at hand. Car shortages are reported on both the Pennsylvania and the B. & O., while other lines have been forced to put their shippers on a restricted allotment. The improvement so far is reflected in the larger volume of coal moving rather than in any increase in prices, but there is no doubt that producers are becoming more optimistic, and there is a definitely better tone to the market.

Exports—The apparent deadlock in the British labor negotiations has created new interest in the foreign trade and resulted in more inquiries from abroad. While the accumulation at some of the Atlantic seaboard terminals is, perhaps above normal, this coal is in most instances, only waiting vessel tonnage. When foreign consumers are definitely convinced that British shippers will be more or less out of the market for the balance of this year, at least, the export business is scheduled for one of the most remarkable booms in the history of the American coal trade.

Lake Trade—There is renewed activity in nearly all branches of the Ohio trade. The gradual increase in the demand for domestic coal, due in part to the recent unseasonably cool weather, is forcing dealers into the market and there is a strong feeling that this improvement will be consistently maintained until the fall trade opens up. The occasional tonnages of consignment coal, forced sales of which have had such an unsettling influence on the market, have now practically disappeared. There are persistent rumors to the effect that the railroads are accumulating large stocks against emergencies and manufacturing concerns are generally increasing their working schedules. The restricted movement in the Lake trade continues the chief depressing factor in the current situation. The improvement is also noticeable to the South, though it is confined more particularly to the volume of coal moving rather than to prices.

Middle Western—The recent cool weather has stimulated buying somewhat and further price advances are under consideration, but in view of the unfavorable response to the recent increases, it is hardly likely that this will be attempted at the present time. The heavy floods in the district tributary to St. Louis, interfered with the movement to such an extent that prices were temporarily forced up though they have since reacted to their former level. The delayed crop movement due to the wet weather, has delayed country buying because of the scarcity of money. The dull market shows a slow but perceptible betterment; increased activity is noted in the steam lines and there is a broader market for the domestic grades.

A Year Ago—Anthracite slows down to a more conservative basis. Much of the West Virginia high-grade bituminous fuels are now out of the market. Large contract closed with Italian government. Internal business adversely affected by slow industrial conditions.

BUSINESS OPINIONS

Boston News Bureau—The paramount factor in the situation today is the position of sterling exchange. A year ago demand sterling bills sold at $5.06. The strength was based on the fact that we owed Great Britain between $300,000,000 and $500,000,000. The banks would not surrender gold at first. They held to gold bills like grim death. A gold pool of $100,000,000 was formed. The pool, however, supplied only absolute wants, but it acted as a weight upon the market and probably prevented demand sterling going higher than it did. But we could see ahead well at that time. We knew that the time was not far off when the balance of trade must turn in our favor, which it did. Today Great Britain owes us three or four times as much as we owed her a year ago on current account, and the amount is daily increasing. Moreover, she cannot see any means of settlement except by gold, a loan or liquidation of our securities. A sufficient amount of gold is inaccessible, and British investors are loath to dispose of their American securities in quantities. So far as her balance of trade is concerned, it is bound to be heavier against her.

Dun—Intrinsically sound fundamental conditions more than offset the adverse influence of existing problems and uncertainties. While increased conservatism is natural under the circumstances, general business has nevertheless made further gains and belief in sustained improvement remains unshaken. Wall Street has given a notable demonstration of confidence after a brief period of unsettlement and though stability has not yet been restored in the foreign exchange market, an adjustment of the present difficulties is expected to result from the negotiations now being conducted. Another large French credit has been established here and New York has assumed a commanding position as the financial center of the world.

Bradstreet's—Uplifting factors continue to assert themselves in trade and industrial circles, but at the same time there is a degree of unevenness in particular sections and certain industries that deprives the situation of uniformity. However, optimism as to the future seems unabated; our international political relations, apparently grave early in the week, appear to have improved; house trade at various centers has been increased by the presence of visiting buyers; some sections report larger road orders; mail-order trade goes on increasing; the southern situation is brighter; money everywhere is plentiful at low rates.

Southern Lumberman—Yellow pine is steadily increasing in price strength, and though orders actually booked this week are scarcely in excess of the volume recorded last week, inquiries are more numerous and the business placed has been at better figures. Nearly all the large manufacturers have issued new price lists since Aug. 1, and some have instructed salesmen to quote advances on lists issued during the past ten days. Better domestic demand for hardwoods is reported from both producing and distributing centers, though this is offset somewhat by lessening in exports, both demand and shipments. While the export movement probably would have kept up to what has been done for the past three or four weeks if shipping space had been available, a slackening in British demand is also reported this week, due to recent shipments from this country.

Marshall Field & Co.—Wholesale dry goods distribution has not been as heavy this week as during the corresponding week a year ago, although the number of buyers in the market has been about the same. The outlook for supplies of imported lines of merchandise was not at all promising a year ago on account of the war, and consequently caused a great rush of buyers to the market and created heavy road sales. Conditions this year surrounding supplies of merchandise are well known, so that it is only natural that immediate distribution would not compare with that of a year ago. Merchants continue to feel optimistic toward fall business. Collections are about normal.

ATLANTIC SEABOARD

BOSTON

Pocahontas and New River market unchanged. Good fall prospect for large export trade. Georges Creek receipts light and Pennsylvania operators look for better demand later. Water freights easy. Anthracite slow.

Bituminous—September opens with no important change in the market for the Hampton Roads coals. Prices less than $2.85 f.o.b. are only occasional now, most of the large shippers being well enough supplied with export orders to move the surplus over coastwise contract requirements. Receipts on contract here are about as usual but there is no spot demand worth mention. The vacation season is now nearly over and it is possible inquiry will improve as the month advances.

Shippers are taking a more hopeful view of the market. The off-shore business is expected to show no let-up for months to come and prices for future delivery are being firmly held. Indeed, there are some who predict that the export trade will be heavier than ever when it is realized particularly in South America that British shippers are out of the market at least until well into 1916.

The Georges Creek shippers are among those who look for an active foreign demand. In August there was a little falling-off in tonnage, but this is expected to be more than made good during September and October. The volume of this grade coming here is still relatively small, although prices are as firm as ever.

The Pennsylvania grades are extremely dull, output being closely held down to contract requirements. There is some hope now of a better demand by the end of this month, particularly if the Southern coals are firm at $2.85. The fact that certain shippers who ordinarily do a large bunkering business in these grades are not likely to be under their usual pressure to make terms may have a bearing on negotiations with the mine-workers next spring.

Water Freights show no change, although the charter demand is perhaps as nearly nil as at any time this year. There is some likelihood of several sailing vessels coming back into the coastwise trade during the fall. More American bottoms have been off shore this year than any year since 1863.

Anthracite—Quite an amount of business was entered the last few days of August in order to save the last monthly advance, but trade is sure to be slack again for a fortnight or so after Labor Day. It will take a better demand at retail than exists now to make much room for September shipments. All the domestic sizes are in plentiful supply, with chestnut the long size. Suprisingly little is heard in this territory from the individual houses.

Bituminous prices at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$0.85@1.40	$1.15@1.60	$1.67@1.77	
Philadelphia*	2.10@2.65	2.40@2.85	2.92@3.02	
New York*	2.40@2.95	2.70@3.15	3.22@3.32	
Baltimore*			2.85@2.95	
Hampton Roads*				$2.75@2.85
Boston†				3.50@3.68
Providence†				3.55@3.68

* F.o.b. †On cars.

NEW YORK

Bituminous situation shows more snap. Mine prices increase. Outlook for busy fall promising. Railroads place large orders. Anthracite shippers hopeful. Many inquiries received. Mines working better. Companies storing coal. Full winter circular goes into effect.

Bituminous—There has been a decided improvement in the soft-coal situation. Demand has increased generally and there has been a substantial advance in mine prices for certain grades. The railroads are largely responsible for the changed conditions. One road is said to have placed an order for nearly one million tons of such coals at Latrobe and Greensburg, to be stored at various points. As a result these coals have been practically taken out of the market for the present.

Tidewater conditions have not as yet felt the improvement but it is the general opinion that in a few weeks business will be active. Mines in the central Pennsylvania fields are working on a three to four day-a-week basis. Car shortages have developed on both the Pennsylvania and Baltimore & Ohio. Many mine workers have left the regions for their native countries but it is not known how seriously this will affect mining operations.

The export situation is holding up. There is little talk being indulged in but it is known that some shippers of Pocahontas coals have gone on the outside to complete cargoes. The situation in Wales has caused many inquiries here and the outlook is encouraging for American exporters. Freight rates continue high. Bunker coals are still in good demand.

Current quotations are on the following basis:

	South Amboy	Port Reading	St. George	Mine Price
Georges Creek Big Vein	$3.20@3.30	$3.20@3.30	$3.20@3.30	$1.75@1.85

Anthracite—The fall season opens with a better feeling in the anthracite coal situation. Dealers are beginning to stir and there are prospects of a busy fall and winter ahead. Mines are working on a better schedule with the companies storing all surplus coals. The West is not taking so much coal while the reverse can be said of the East. Inland dealers are getting busy. One reason advanced for the slow buying during the spring and summer was the refusal of dealers to extend credit and the first touch of cold weather will bring orders for quick deliveries.

The last monthly advance of ten cents per ton on prepared sizes was made on Sept. 1, the companies winter schedule going into effect on that date. While it is too early to give any definite figures on shipments of anthracite during August it is expected they will show a reduction as compared with the corresponding month of 1914. There is no great surplus of hard coal on hand. Nut coal which was the weakest of the prepared sizes is not so pressing but is being offered by individuals at from 25 to 35c. off companies' circular. Egg coal continues plentiful and is being quoted at about 35c. off with stove at 25c. below circular.

The steam coal situation shows but little improvement. There is no surplus because of the mining restrictions. Nos. 2 and 3 buckwheats are practically out of the market. Pea coal of the better grades is quoted at from $3.15 to $3.25. Buyers of No. 2 buckwheat are not promised shipments inside of ten days.

Current quotations follow:

	Lower Ports		Upper Ports	
	Circular	Individual	Circular	Individual
Broken	$5.05		$5.10	
Egg	5.30	$4.80@5.30	5.35	$4.90@5.35
Stove	5.30	4.80@5.30	5.35	4.90@5.35
Chestnut	5.55	5.00@5.55	5.60	5.10@5.60
Pea	3.50	3.25@3.50	3.55	3.50@3.55
Buckwheat	2.75	2.25@2.75	2.80	2.25@2.80
Rice	2.25	1.75@2.25	2.30	2.00@2.30
Barley	1.75	1.45@1.75	1.80	1.75@1.80

PHILADELPHIA

Anthracite shows improved tone, with good trade in sight. Most sizes still offered off circular, but prices show tendency to stiffen, especially pea. Bituminous improved, and brisk exports continue, with vessel tonnage short and rates high.

Anthracite—There have been unmistakable signs of improved business the past week. Buyers who have held off until the last minute to lay in their winter fuel supply are beginning to send in their orders influenced no doubt by the real fall weather that prevailed the latter part of August. Practically all the representative dealers are stocked to capacity and they state it is their intention to carry full supplies for an indefinite period. After Labor Day it is expected the movement of coal will begin in real earnest, as that marks the end of the vacation period, with schools opening and families all home.

There is still plenty of coal to be had at prices less than circular. Egg continues in demand at a fair price while on stove $3.70 is about the average, showing it is rather weaker than a month ago. Chestnut is still variable as to price, fluctuating from April circular up to current circular; although the latter figure is being asked in a few instances there are actually no sales being made. Pea is a little firmer, probably because the individuals have booked about all they care to at the unusually low prices prevailing all summer and they are now trying to secure from ten to twenty cents more on present offerings.

There is a definite tendency on the part of both the big shippers and the individuals to really get nearer the full circular prices now that the expectation of a brisk fall and winter trade is in sight. The retail men, however, seem to hesitate to put in effect the fall and winter rates. This is usually customary with the first of September, but for the time being they are sharing with their customers the advantage they have had in buying. This surely will not last very long now and a few more cold days will see prices at the full winter level.

This week the producing interests announced the full fall and winter circular prices effective Sept. 1, which are as follows, to which the Pennsylvania State tax of 2½% must be added:

	Line	Tide		Line	Tide
Broken	$3.50	$4.75	Pea	$2.50	$3.25
Egg	3.75	5.00	Buckwheat	1.25	2.25
Stove	4.00	5.00	Rice	.85	1.75
Chestnut	4.15	5.25	Barley	.50	1.50

Bituminous—While there has been nothing noticeably brisk about the business this past week, there is undoubtedly a better tone and most of the shippers are really optimistic, feeling that the worst is now behind them, with indications of an active season ahead. The only activity of the week was still confined to slack coal; there has not been any particular large change in prices and there is no doubt that the slight stringency will be overcome with the increased demand for the other sizes.

The news of the export trade is only a repetition of the story for several months past—brisk, with an ever increasing volume of inquiries. The one great difficulty continues to be the difficulty in making charters. There is only a light tonnage offering, most owners holding off, feeling that still better rates are a certainty. The ruling prices are as follows:

Georges Creek Big Vein	$1.65@1.75	Fairmont gas, mine-run	$1.15@1.25
South Fork Miller Vein	1.50@1.60	Fairmont gas, slack	.70@ .80
Clearfield (ordinary)	1.00@1.20	Fairmont lump, ordinary	.85@ .95
Somerset (ordinary)	1.00@1.15	Fairmont mine-run	.75@ .80
West Va. Freeport	.85@ .95	Fairmont slack	.55@ .65

BALTIMORE

Market steady with tendency toward slight gains. Anthracite trade increasing. Export business increasing.

Fairly cheap coal is still offering considering the near approach of fall and winter. Lower grade fuels of West Virginia and Maryland are still to be had at around 85 to 90c. Pennsylvania ordinary fuels are bringing around 90c. to $1 at the mines. Medium to best coals call for $1.10 to $1.35, or $1.40 in some cases.

Anthracite dealers are feeling more confident over the situation. Household sizes for storage are now in fair call for early September. Many of the hard-coal men believe that the late September and October business will be very heavy, because nothing like the usual amount of spring purchasing took place.

Export business took a jump. During the week a total of 66,670 tons was loaded here for foreign ports. The previous week had shown a little more than 52,000 tons, and the week before that not quite 23,000 tons.

HAMPTON ROADS

Movement foreign still good. Prices firm with a steady foreign demand for New River and Pocahontas.

The coal movement from tidewater during the week has been heavy. The Italian ports are still getting the largest share of the export business and as usual the largest percentage of the coastwise movement has been to New England. The quantity supplied to steamers for bunkers has shown up well and although the number of steamers calling here may not be up to normal, the quantities taken are excessive.

In addition to the demand for standard grades of run-of-mine there has been some inquiry for nut and slack coal for the New England market and some large shipments have moved. The accumulation on the railroad yards is perhaps somewhat in excess of the normal supply but as a large number of the shippers have contracted tonnage due it is necessary that large quantities be kept to take care of vessels promptly.

During the past week the Virginian Ry. dumped over their pier in twenty and one-half working hours 614 cars or about 30,500 tons of coal. This is quick work seeing that only one dumper is used at this pier.

Railroad Tonnages—Dumpings over the local piers for the past several weeks compare as follows:

	Week Ending				
Railroad	July 31	Aug. 7	Aug. 14	Aug. 21	Aug. 28
Norfolk & Western	188,593	135,357	171,252	172,546	211,699
Chesapeake & Ohio	84,018	110,861	83,390	129,826	103,472
Virginian	39,335	64,397	63,066	77,136	82,131
Totals	311,949	310,515	317,708	379,508	397,302

OCEAN FREIGHTS

A number of steamers have been chartered to load coal for South American and West Indian ports. Plate rates are practically the same as a week ago. Mediterranean rates are firmer; several steamers were chartered last week at $10.16.

The freight market is now quotable as follows:

To	Rate	To	Rate
Havana	$2.50@3.00	Bermuda	**$3.00**
Cardenas or Sagua	3.00@3.50	Vera Cruz	3.25@3.75
Cienfuegos	3.25@3.50	Tampico	3.25@3.75
Port au Spain, Trinidad	**3.75**	Rio	8.28@8.40
St. Lucia	3.50@3.75	Santos*	8.40@8.64
St. Thomas	3.00@3.25	Montevideo	**8.04**
Barbados	**3.75**	Buenos Aires or La Plata†	**8.04@8.16**
Kingston	2.75@3.25	Rosario	**8.40**
Curacao	3.25	West Coast of Italy	9.84@10.08
Santiago	2.75@3.25	Barcelona**	9.12@9.36
Guantanamo	2.75@3.25	Valparaiso or Callao	7.00
Demerara	4.50@5.00	Marseilles	9.36@9.60

Note—Rates noted in **bold face** type are only approximate.

* Consignees paying dockage dues. ** Spanish dues for account. † Quotations on Plate coal by British steamers; neutral steamers are more difficult to obtain and the rates are always higher.

W. W. Battie & Co.'s Coal Trade Freight Report.

Note—Charters for Italy, France and Spain read: "Lay days to commence on steamer's arrival at or off port of discharge. 24c. per net register ton per day demurrage."

NOTES

Sweden—Arrangements have been completed for the export of 600,000 tons of coal from Germany to Sweden.

Philadelphia, Penn.—The U. S. Government has recently been arranging charters with steamers to load coal at Atlantic Range ports for San Francisco and various other Pacific coast naval stations. The first charter was for $4.85 per ton to San Francisco.

LAKE MARKETS

PITTSBURGH

Continued though slow improvement, with excellent line demand and light Lake shipments. Operations fully 60% of capacity. Recent advance in contract coal easily maintained.

The local coal market continues to improve, although rather slowly. The line demand is now described as excellent. The steel mills continue to run full and are taking somewhat more coal than a week ago. Railroad requirements have increased slightly. Lake shipments continue light but hope continues that there will be a slight spurt at least toward the close of the season. Some of the mines are operating nearly full, and while there are many operating three days a week or less they are usually the smaller mines and the operation of the Pittsburgh district as a whole is fully 60% of rated capacity.

There is still a surplus of free coal offered and prices are not quotably higher, although they are certainly firmer. The higher quotations lately in evidence on contract coal are very well maintained, operators feeling confident the market will be better in all respects later on. There has been little buying by retail dealers thus far but the fall movement is beginning in domestic coal. For free coal the market is quotable firm as follows: Slack, 50@60c.; nut and slack, 90@95c.; nut, 95c.@$1; mine-run, $1@1.05; ¾-in., $1.10@1.15; 1¼-in., $1.20@1.25, per net ton at mine, Pittsburgh district. On contracts to Apr. 1 the market is firm as follows: Slack, 85@95c.; mine-run, $1.15; ¾-in., $1.25; 1¼-in., $1.35.

BUFFALO

Car and labor shortage developing. Prices unchanged but notably stiffer. Anthracite companies stocking heavily in anticipation of a heavy winter demand.

Bituminous—The steady, though rather slow improvement promises to be hastened soon by a general shortage of both cars and men. Coal roads are beginning to put the mines on allotments of cars and some of the mines find that they have not men enough to meet sudden demands on them. There is every prospect of serious difficulty from both these sources early in the fall trade, as soon as the crops begin to move. At the same time the circular prices of bituminous are not higher, though they are more firm, slack going on a par with sizes. Some of the leading Pennsylvania coal companies have made a new price for Buffalo territory, 5c. lower than the last one, being, with freight added, $2.65 for lump, $2.50 for three-quarter, $2.40 for mine-run and $2.05 for slack. This will be the official Buffalo list of prices till further notice.

In a general way the Buffalo market is doing fairly well. There is now a feeling on the part of consumers that they should carry some coal. Cars are going to be short and the prospect of labor difficulties increases. Strikes are nearly certain in the early spring, and they may be preceded by other stoppages in the same line. Besides the actual consumption of coal is increasing steadily.

Anthracite—It is expected that the demand will begin to increase in a few days. What increase took place near the close of August was on account of the ten-cent reduction and was not large, as those who cared to take advantage of it had mostly done so when more reduction was offered. Buying during the summer has been as light as in any recent summer, yet the fall and winter trade may turn out not to be very heavy. People who have been out of work are doubling up their families and saving fuel.

The anthracite price this month resumes the maximum, which is $5.60 for grate, $5.85 for egg and stove, $6.10 for chestnut and $4.30 for pea, all f.o.b. Buffalo, with 25c. addition for loading on vessels. This includes the Pennsylvania state tax.

There is much report of coal being put into stock by the anthracite companies, which is an indication that they are confident that there will be a time before spring when they will be unable to meet the demand. Stocking coal is expensive and it also injures the market price of it. Shipments by Lake are not very active. One of the heaviest shipping docks is doing very little, on account of the congestion at upper-lake ports. The shipment for the week was 109,100 tons.

COLUMBUS

Increase in the demand for domestic sizes. Prices firmer and the tone of the market is improving. Manufacturing demand steadily increasing and railroads are stocking.

Renewed activity is reported by all branches of the coal trade during the past week This is especially true of the domestic trade where the demand is better and the volume of business increasing. Steam business is also rather active and prospects for the future are considered brighter.

Retailers who are now able to move their stocks are in the market for more coal; stocks are not as large as was supposed and they are buying freely for immediate shipment. Rural dealers are also experiencing a better demand since the rains have ceased. Retail prices are firmer all along the line. Pocahontas and West Virginia splints are still in good demand and there is some stocking of Hocking lump. Anthracite is coming into the Columbus market in larger quantities.

Steam business is also more active as manufacturing is steadily improving, especially along the line of making war munitions. Railroads are stocking up along their lines to guard against emergencies. Steam prices are strong and there is a notable absence of cheap demurrage coal on the Columbus market.

The Lake trade is rather active although the larger part of the tonnage shipped from Ohio ports is mined in West Virginia. The movement off the docks of the Upper Lake ports to the interior is better and a number of operators are rushing large quantities to the Northwest. Dock prices remain unchanged. The Toledo docks of the Hocking Valley handled 116,000 tons last week. More strength has developed in Pocahontas although some cutting in the last circular list is reported.

Prices in Ohio fields are as follows:

	Hocking	Pomeroy	Eastern Ohio	Kanawha
Re-screened lump.......	$1.45	$1.50		
Inch and a quarter......	1.35	1.35	$1.25	$1.30
Three-quarter inch......	1.25	1.25		1.25
Nut..................	1.15	1.25		1.15
Mine-run.............	1.05	1.10	1.00	1.05
Nut, pea and slack......	0.65	0.70	0.55	0.65
Coarse slack...........	0.55	0.60	0.45	0.55

Mines have been working at about the following percentages of full capacity:

District	Week Ended				District	Week Ended			
	Aug. 7	Aug. 14	Aug. 21	Aug. 28		Aug. 7	Aug. 14	Aug. 21	Aug. 28
Hocking....	25	25	30	35	Cambridge.	30	35	35	35
Jackson....	20	20	20	20	Masillon...	25	30	50	35
Pomeroy ..	25	40	40	45	Eastern O..	30	55	55	55
Crooksville.	30	30	30	30					
					Average..	30	33	34	38

CINCINNATI

A generally stronger market is noted. Demand improving somewhat in all lines.

A gradually improving demand for the domestic grades is the most significant feature of the market during the past week. This movement from now on should increase steadily as the bulk of the winter stocks are yet to be handled. The relative scarcity of nut and slack, due to the sub-normal domestic demand, is still the strongest factor in the steam market. In some lines of industry, especially the steel and machinery trades, plants are actively engaged, and require a maximum amount of fuel, but the general industrial situation remains such that the coal requirements are not sufficient to make a strong steam market.

TOLEDO

Considerable coal passed through Toledo ports in August. Ore movement shows improvement. Possible car shortage predicted.

Toledo coal dealers who have just returned from the upper docks claim that the supplies there are extremely heavy and are not moving as rapidly as could be desired. This of course will keep the Lake traffic down unless the situation there should change notably within a short time.

Some concerns report Pocahontas and smokeless coals as showing a trifle weakness; others are entirely sold up and predict a heavy demand for all smokeless coals a little later on due to the general opening of business in the East and the heavy shipment to Tidewater. It is also predicted that this will boost the price of other high-grade coals.

There is some improvement noted in the domestic trade. Threshing will not be over until the first of October this season, owing to the wet weather. Some dealers are of the opinion that a car shortage will soon occur as the demand for moving crops will undoubtedly be very heavy and the call for ore cars is becoming insistent. Prices here remain fairly firm.

DETROIT

Slight improvement noted in steam grades. Less coal on demurrage. Lake freighters returning to upper ports light.

Shippers report an improvement in the market for steam coal during the week. Orders are not large and the buyers seemingly have not yet started stocking up, but there is a gratifying number of small orders coming in. There has been a reduction in amount of coal shipped into Detroit on speculation, much of which usually is forced on the market at prices that have exerted an unsettling influence.

Domestic sizes are rather quiet, neither the retail dealers nor the householders showing any disposition to stock up. A few retail dealers made an effort to increase their stocks of anthracite before the final discount period elapsed with the end of August but the amount of business booked was less than expected.

In the Lake trade the movement is far short of previous years. Freighters which usually take coal on every upbound trip are now going without cargo. The unloading docks on the Upper Lakes carry an unusual quantity of coal because of the belated shipment by rail to interior points.

LOUISVILLE

Larger movement and slight increase in prices. Retail trade weak.

An improvement is noted in the Kentucky market, both as to domestic and industrial grades; this refers principally to the volume moved though the September prices show a slight advance. They are, however, still abnormally low. The retail situation, especially in Louisville, is showing much less strength than usual at this time of year and prices are very low. The mines generally are working at from two-thirds to three-fourths of capacity and the prospects are that full time operations will be the rule soon. Prices rule at from $1.40 for block up to $2.10, and from 25 to 40 and 50 to 65c. for nut and slack, f.o.b. mines.

NEW ORLEANS

Bunker business on the river has now assumed almost normal proportions. The number of ships arriving and leaving this week indicates that there is a healthy resumption of river trade.

COKE

CONNELLSVILLE

Coke market definitely stronger. Sales of prompt furnace at advanced prices and higher figures quoted for forward. Production and shipments make new high record for the year.

Following the removal of some of the pressure in the prompt furnace coke market already reported the market has definitely turned stronger, with sales of prompt coke aggregating between 5000 and 10,000 tons at $1.60, a price which now seems to be the minimum of the market for standard grades. Production has been adjusted more closely to demand, while some of the furnaces that had required shipments on contract to be curtailed are now working better and taking normal tonnages. The continued improvement in the iron and steel market, and particularly the recent advances in pig iron, have encouraged operators to expect considerably higher prices in future.

There is also developing a substantial inquiry for contract furnace coke over the first half of 1916. Definite prices have not yet been quoted but operators feel they should secure more than $2 a ton on such contracts and as they recognize that it is difficult to close contracts at prices very much above the spot market they are disposed to ask higher prices for spot. Foundry coke continues strong while furnace coke is quotable higher on all deliveries, as follows: Prompt furnace, $1.60; September furnace, $1.75; furnace to Jan. 1, $2; prompt foundry, $2.25@2.60; contract foundry, $2.30@2.60, per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Aug. 21 at 382,606 tons, an increase of 8193 tons and shipments at 383,628 tons, an increase of 4763 tons. Both production and shipments made new high records for the year.

Buffalo—There is a fair activity in the trade at former prices. An effort to advance the price in this market did not succeed. The tonnage continues considerably larger than formerly and if the situation is in any way indicated by the receipts of iron ore at this port there should be an advance soon. During four of the last days of August the amount was 150,441 tons. Coke prices continue at $4.25 for best 72-hr. Connellsville foundry and $3.30 for stock coke.

Chicago—The demand for all sizes of coke is stronger, and furnace and foundry coke particularly is brisk. There has been a general marking up of prices, and quotations are as follows: Byproduct foundry, $4.90@5.10; byproduct domestic, $4.75; Connellsville, $4.75@4.90; Wise County, $4.75@4.85; gas coke, $3.85@4.

MIDDLE WESTERN

GENERAL REVIEW

Market shows improvement. Domestic buying expanding. Anthracite shows signs of activity. Smokeless demand dull. Screenings steady at last week's prices.

Trade is of moderate proportions and still spotty but shows a slow though perceptible betterment. All grades of domestic coals seem to have a wider market and in steam lines there is increased activity reported. Orders from the country continue in better volume, and these orders call for a great variety of different sizes for immediate shipment. Lack of cash is still the main factor in country districts, accounting for delayed absorption, for which wet weather is much to be blamed. Many farmers depend upon their grain money to buy coal.

A number of Western railroads are making preparations to stock considerable quantities of coal beginning Sept. 1 in anticipation of a suspension in mining operations next spring pending the fixing of a new wage agreement. Some of the Western trunk lines have already started stocking to guard against emergencies.

While shippers in several fields are contemplating further advances in prices next month, averaging 15c. per ton, it is unquestionably true that the orders received so far have not kept pace with the advances already made. The weather turned suddenly cold on Thursday of last week which stimulated storage buying among householders. While a good deal of uncertainty has attended the screenings market recently, prices are now more firm than they were two or three weeks ago, and shipments on contracts are heavier.

Trade via the Lakes is still very slow, and it is the consensus of opinions that there is not much hope for any large movement during the present season. The docks are hoping for relief from congestion when the fall rush of orders begin.

Complaints are made in the Northwestern markets of considerable price cutting. Some of these disrupted prices apply to anthracite, but it is more general in bituminous coals.

A number of mines in the southern part of Illinois, and in the Springfield and Peoria districts, which have been closed since last spring, are reopening. The C. & A. Ry. has placed orders to rush all hopper-bottom cars now on storage tracks needing repairs to their Bloomington shops, so that they may be put in serviceable condition for hauling coal upon the arrival of colder weather.

CHICAGO

General advance in price schedules effective Sept. 1. Shipments in a larger volume. Smokeless weak. Good month-end demand for anthracite but prices remain low.

It is reported that most of the Illinois operators will increase list prices Sept. 1. Franklin County shippers will ask $1.75 for the coarse sizes, Williamson County the same, and others are expected to name a minimum $1.60 for lump and egg, and $1.75 for No. 1 washed. This prospective advance and increase in freight rates has caused a rush of business to the Franklin and Williamson County mines during the past week. Screenings are slightly easier, having declined on an average of 5c. per ton. Saline County operators expect to advance coarse sizes to $1.65 Sept. 1.

While Springfield operators are considering an increase in the circular, there is a good deal of doubt that this movement will be a concerted one. Steam and domestic coals have been stronger and screenings are about the same.

Shipments from the Clinton field have been in larger volume for domestic sizes, and it is said that the operators will advance prices 10c. per ton Sept. 1. The Knox County operators are still devoting most of their efforts to producing steam coal which averages them 80c. per ton. The demand for Sullivan County coal is not improving as fast as elsewhere, although it is understood the operators will ask higher prices for Nos. 5 and 6 coal beginning Sept. 1. The Sullivan County mines are operating about three days per week, and most of their coal is being shipped to Indianapolis and the Gas Belt.

Smokeless mine-run is moving plentifully at $1.25, and the lower prices for August shipment have not so far been the means of stimulating the market to any extent. Smokeless shippers expect to return to the $1.40 basis on mine-run Sept. 1. Country shipments have improved, and no accumulation of prepared sizes has occurred. Pocahontas and New River lump is being readily absorbed at prices ranging from $2.10 to $2.15, and egg at from $1.90 to $2.25; the market has been more quiet than shippers anticipated.

Hocking coal has been in good demand for harvesting purposes, and prices have been firmly held. It is rumored that 1¼-in. lump will advance on Sept. 1 to $1.60.

Some little improvement is noted in the market for Kentucky coals. Apparently the demand from Southern points has increased, with the result that not so much free coal is thrown on the northern markets at low prices.

The demand for anthracite toward the close of August was stronger especially for chestnut. Considerable independent anthracite is still being sold under circular prices, notwithstanding the rate advance. Householders in Chicago have absorbed considerable quantities of anthracite of various sizes in the last ten days.

Quotations in the Chicago market are as follows:

	Williamson and Franklin Co.	Springfield	Sullivan	Clinton	Knox and Greene Cos.

ST. LOUIS

Severe floods have seriously interfered with the movement. Cool weather stimulates the demand and prices are firm.

Floods during the past week hindered the movement of coal to the St. Louis market and sent the price of lump up 5c. and that of screenings 10c.; the latter, however, lost half of the increase before the end of the week. There were washouts on nearly all the roads entering St. Louis and for several days there was no coal arriving. Local coal yards were submerged and could make no deliveries. The Terminal Railway Association had difficulty in handling the coal that was on tracks before the flood came.

The prices on anthracite for September shipment to East St. Louis and St. Louis are as follows: Chestnut, $7.55; egg, $7.30; stove, $7.30; grate, $7.05. The rate of $4.25 gross ton applies.

The cool weather has caused an increased demand for domestic coal and prices are ruling very firm on all sizes. Screenings have been well maintained during the week. The indications are that Sept. 1 will bring a marked advance in all domestic sizes.

Quotations are as follows:

	Franklin Co.	Williams Co.	Staunton	Sparta	Standard
6 in. lump	$1.50@$1.65	$1.40@$1.50	$1.30	$1.20	$1.10@1.15
3 in. lump	....	....	1.20	....	....
2 in. lump	....	....	....	1.00	.95
Egg	1.50@ 1.60	1.25@ 1.40	....	1.00	.90@ .95
No. 1 nut	1.50@ 1.60	....	....	....	.90
No. 2 nut	1.25@ 1.35	....	....	....	....
No. 1 washed	....	1.50@ 1.60	1.50	....	....
No. 2 washed	....	1.40	1.35	....	....
No. 3 washed	....	1.25	1.25

No. 5 washed	....	.75@ .80	.80	....	....
Scgs	....	.55@ .60	....	.55@ .60	.55@ .60

The above prices are f.o.b. mine, Franklin and Williamson County coal rate to St. Louis being 72½c. per ton and the balance 57½c. per ton. Rates to East St. Louis, Madison and Granite City, Ill., are 25½c. lower.

INDIANAPOLIS

Shortage of gondola cars for first time this year. Movement of domestic lump continues to improve.

Operators are experiencing their first pinch this season in the way of a shortage of gondola cars. The trouble is mainly on the Vandalia lines which carries a large percentage of the output of the Indiana mines. The demand for domestic lump improves as the season advances. August, which is usually the hottest month, was unusually cool this year which made it necessary to buy some coal and served as a strong reminder that the coal season is rapidly advancing.

Operators have no trouble in disposing of screenings. No. 4 commands 90c. f.o.b. mines and No. 5 80c. It is said some No. 5 is being offered at 75c. but this is a low-grade product. With the opening of September retailers are beginning to get a little busier. Their prices remain unchanged.

PRODUCTION AND TRANSPORTATION STATISTICS

BITUMINOUS COAL MOVEMENT

The following is a summary of the movement of coal and coke over 13 principal railroads during May and the first five months of the last two years, in short tons:

	May		5 Months	
Anthracite	1914	1915	1914	1915

I. C. C. DECISION

I. C. C. No. 5638—Plymouth Coal Co., vs. Delaware, Lackawanna, and Western R.R. Co.

Defendant's demurrage regulations governing anthracite coal awaiting transshipment at or near tidewater at Hoboken, N. J., found reasonable.

Coal Contracts Pending

The purpose of this department is to diffuse accurate information of prospective purchases and prices with a view to affording equal opportunity to all, promoting market stability and inculcating sound business principles in the coal trade.

For the official advertisements of bids wanted see the Contracts-to-Be-Let Section on Page 36.

✚Indicates contracts regarding which official information has been received.

Recast

In the following table we give a list of all old contracts coming up for consideration during the ensuing week. The table gives our contract number, the name of the purchaser, city, tonnage and page on which the detail notice appeared.

No.	Purchaser	City	State	Tonnage	Page
1253	Bd. of County Comrs.	Stanley	N. D.		323
1257	Bd. of County Comrs.	Watertown	S. D.	90b	323
1278	Bd. of County Comrs.	Bloomington	Ind.	100b	324
1286	Cass County Bd. of Comrs.	Fargo	N. D.		324
1287	Bd. of County Comrs.	Greensburg	Ind.	175b	324

	...	...	...	...	...	3.95
	...	...	...	2.40	...	...
	...	...	...	2.37½	...	...

The contract has not yet been awarded. Address Dir. of Schools F. C. Hogen, School Headquarters, Rockwell Ave. and East Sixth St., Cleveland, Ohio.

✚1090—Columbus, Ohio—No award has yet been made on this contract (pp. 117, 366), which provides for furnishing the various city departments with coal. Bids of West Virginia operators were lower, but there is a great deal of pressure being exerted to force the contract to Ohio operators. Address Clk. Paul B. Kemper, Pub. Service Com., Columbus, Ohio.

1200—Cincinnati, Ohio—Bids have been received on this contract (p. 244), which provide for furnishing the local Water Works Department with coal as follows: Reliance Coal Co., Filtration Plant, $2.21 per ton; Consolidation Coal Co., Western Hills, $1.99 per ton; Campbells Creek Coal Co., Main Station, 5.875c. per bu. in barge lots, and $2.15 per ton delivered by gawon. Address Asst. Secy. C. A. Zech, Pub. Service, City Hall, Cincinnati, Ohio.

1252—Minot, N. D.—All the bids on this contract (p. 284), which provides for furnishing the schools of the Burlington School District No. 7, with coal have been rejected and the call for bids will be readvertised. Bids were received from J. S. Wallace and the City Coal Co. Address Clk. W. E. Gross, Burlington School Dist. No. 7, Minot, N. D.

✚1301—Pewee Valley, Ky.—Bids on this contract (p. 366), which provides for furnishing the Confederate Home with mine-run, lump and nut coal will be received until Sept. 5. Bids will be considered only on good steam making coal, and are to provide for delivery as required. Address Commandant Henry George, Confederate Home, Pewee Valley, Ky.

New Business

✚1332—Webster City, Iowa—The Board of Education will receive sealed bids until 5 p.m., Sept. 6, for furnishing from 700 to 900 tons of 3-in. Iowa steam coal, and 100 to 300 tons of Iowa lump or 6-in. egg coal. Bids are to include cost of delivery to the school buildings as required. Address Secy. J. M. Blake, Bd. of Edu., Webster City, Iowa.

1333—Edgeley, N. D.—Bids will be received until Sept. 7 for furnishing the High School with lignite coal as may be required during the ensuing year. Bids should include cost of delivery in the basement of the school in carload lots. Address Clk. Ernest Steel, Bd. of Edu., Edgeley, N. D.

✚1334—Parker, S. D.—Sealed bids will be received until 1 p.m., Sept. 8, for furnishing Turner County with approximately 100 tons of the best Virginia lump coal. Address County Audr. O. M. Rasmussen, Parker, S. D.

✚1335—Moberly, Mo.—The Board of Public Works will receive bids until noon, Sept. 3, for furnishing the city waterworks with coal until Apr. 1 of next year. Bids are requested on both mine-run and lump coal, to be delivered in the coal bunkers and storage shed at the plant. Address Supt. C. H. Chamblin, Bd. of Pub. Wks., 212 No. William St., Moberly, Mo.

1336—Washington, Ind.—The Board of County Commissioners at this place will receive bids until Sept. 7 for furnishing a year's supply of mine-run, lump and nut coal. Address County Audr. Lew C. Core, Bd. of County Comrs., Washington, Ind.

✚1337—Wilmington, Del.—The United States Engineer's Office will receive bids until 11 a.m., Sept. 8, for furnishing 3000 tons of bituminous coal. Complete details may be had on application. Address. United States Engineer's Office, Old Federal Bldg., Wilmington, Del.

✚1338—Jackson, Miss.—The Board of Supervisors of Hinds County, Miss., will receive bids until Sept. 6 for furnishing 140 tons of No. 2 lump coal to be delivered in the basement of the courthouse and jail, and also one car of No. 1 lump, f.o.b. Raymond. Address Chancery Clk. W. W. Downing, Hinds County Bd. of Supervisors, Jackson, Miss.

✚1339—Cleveland, Ohio—The Board of Public Service will receive bids until noon, Sept. 9, for furnishing coal to be used at the garbage reduction plant. Complete details may be had on application. For previous notice in regard to this contract see No. 50, Vol. 7, p. 149. Address Dir. A. A. Benesch, Pub. Service Dept., 204 City Hall, Cleveland, Ohio.

1340—Livingston, Mont.—The Board of County Commissioners will receive bids until 10 a.m., Sept. 9, for furnishing approximately 200 tons of lump coal to be delivered as required at the County Court House and jail. The contract will run for one year. A certified check for $200 must accompany each bid. Address County Clk. Chas. A. Burg, Bd. of County Comrs., Livingston, Mont.

✚1341—Great Falls, Mont.—Bids will be received by school district No. 1 until 4 p.m., Sept. 7, for furnishing coal as required by the local schools during the ensuing year. Bids must be accompanied by a certified check for $100, and the successful bidder will be required to furnish a satisfactory bond for $1000 guaranteeing the faithful performance of the contract. Address Clk. H. A. Cary, School Dist. No. 1, Great Falls, Mont.

1342—Boone, Iowa—The Independent School District at this place will receive bids until 3 p.m., Sept. 9, for furnishing and delivering the best grade lump coal as may be required at the several school buildings in the district during the ensuing year. Address Secy. R. T. Duckworth, Independent School Dist., Boone, Iowa.

1343—Brazil, Ind.—The Board of County Commissioners at this place will receive bids until Sept. 7 for furnishing coal as may be required during the ensuing year. Address County Audr. W. O. Graeser, Bd. of County Comrs., Brazil, Ind.

+1344—Irene, S. D.—The County Commissioners will receive bids until 2 p.m., Sept. 7, for furnishing the best screened Hocking Valley coal for the County Court House and jail, during the period beginning September of this year, and ending April of next year. Address County Audr. W. O. Nelson, Bd. of County Comrs., Irene, S. D.

+1345—Rich Hill, Mo.—The Board of Education at this place will receive bids until noon, Sept. 7, for furnishing the city with approximately 4000 bu. of coal to be delivered in the bins of the various school buildings as may be directed. Address Secy. L. C. Stonebraker, Bd. of Edu., Rich Hill, Mo.

1346—Magnolia, N. J.—The local Board of Education will receive bids until 8 p.m., Sept. 8, for furnishing one carload of the best stove coal for each of the public schools on Lincoln and Adams Ave. The carloads are to contain from 25 to 30 gross tons. A certified check for one-fifth of the contract price must accompany all proposals. Address District Clerk, Bd. of Edu., Magnolia, N. J.

1347—Sullivan, Ind.—The Board of County Commissioners will receive bids until Sept. 7, for furnishing the year's supply of coal. Address County Audr. W. S. Bicknell, Bd. of County Comrs., Sullivan, Ind.

+1348—Brookville, Ind.—The Franklin County Board of Commissioners will receive bids until Sept. 6 for furnishing coal as required in the county institutions during the ensuing year. Address County Audr. R. C. G. Reisel, Brookville, Ind.

+1349—Ogden, Utah—The Board of Education at this place usually contracts about Oct. 1 for their annual fuel requirements involving approximately 1400 tons of screened slack coal. The business last year was done at $2.85 per ton delivered at the schools or $2.70 f.o.b. Castle Gate coal is being used on the present contract. Address Bd. of Edu., Hudson Bldg., Ogden, Utah.

+1350—Bluffton, Ind.—The Wells County Board of Commissioners received bids until Aug. 28 for furnishing coal as required at the county institutions during the ensuing year. Address Board of County Commissioners, Wells County, Bluffton, Ind.

+1351—Fowler, Ind.—The Benton County Board of Commissioners will receive bids until Sept. 6 for furnishing 140 tons of anthracite egg coal and 10 tons of bituminous coal to be used at the county institutions during the ensuing year. Address County Audr. Warren Mankey, Bd. of County Comrs., Fowler, Ind.

1352—Kansas City, Mo.—The Security Stove Co. at this place will buy approximately four cars of bituminous coal about Oct. 1. Address H. E. Blakeslee, Security Stove Co., 17th St. and Oakland Ave., Kansas City, Mo.

1353—Petersburg, Ind.—The Pike County Board of Commissioners will receive bids until Sept. 7 for supplying coal required at the poor asylum and county jail during the ensuing year. Address County Audr. John D. Gray, Bd. of Comrs., Petersburg, Ind.

+1354—Albany, N. Y.—The State Hospital will receive bids until 10:30 a.m., Sept. 8, for furnishing the Buffalo State Hospital for the Insane with coal during the six months' period beginning Oct. 1. The hospital requires 25,000 to 30,000 tons per year. Address Purchasing Committee, State Hospital, Room 138, Capitol, Albany, N. Y.

1355—New Orleans, La.—The St. Charles Hotel at this place is requesting bids on their fuel requirements for the ensuing year. Address Secy. Treas. S. A. Trufant. A. S. Amer & Co., St. Charles Hotel, New Orleans, La.

+1356—Storm Lake, Iowa—The Municipal Light and Water Department at this place will contract about Oct. 1 for their annual requirements of coal involving approximately $5700 worth. The coal last year cost $3.54 per ton placed in the bins for 6-in. Iowa lump. Address President Edgar E. Mock, Municipal Light & Water Dept., Storm Lake, Iowa.

+1357—New Kensington, Penn.—The School District will receive bids until 8 p.m., Sept. 10, for furnishing mine-run, lump, nut and slack coal as may be required during the ensuing year. Address Secy. B. F. Davis, School Bd., New Kensington, Penn.

1358—Louisville, Ky.—The Peter & Burghard Stone Co. will contract about Oct. 1 for their annual fuel requirements involving approximately 40 carloads. Delivery will be by wagon, and the grade and quality desired will be decided upon later. Address Peter & Burghard Stone Co., 810 S. 13th St., Louisville, Ky.

1359—Chippewa Falls, Wis.—The County Government will receive bids for furnishing and delivering coal as required during the ensuing year at the County Court House and jail. Bidders must specify the heat value of the coal they propose furnishing. Address Chn. Jos. Nolte, County Court House, Chippewa Falls, Wis.

+1360—Hannibal, Mo.—The Board of Public Works usually contracts about Oct. 1 of each year for their annual fuel requirements involving approximately 12,000 tons of slack coal. The current contract was negotiated at $1.34 per ton f.o.b. tracks at Hannibal. Address Board of Public Works, Hannibal, Mo.

1361—Davenport, Iowa—The Moline Rock Island Manufacturing Co. and the Tri-City Railway & Light Co. usually contract for their annual fuel requirements about Oct. 1. The combined companies consume approximately 75,000 tons of 1¼-in. screening per year. The business is done on competitive bids. Address G. W. Kuhn, Moline Rock Island Co., Davenport, Iowa.

+1362—Hopkinsville, Ky.—The Christian County Board of Education is receiving bids for approximately 10,000 bu. of lump coal to be delivered as required during September and October. Address Superintendent, Christian County Board of Education, Hopkinsville, Ky.

+1363—Berg, N. D.—The Grail School District will receive bids until Sept. 7 for furnishing the local schools with coal as may be required during the ensuing year. Address Clk. A. L. Rothie, Grail School Dist., Berg, N. D.

+1364—Traverse City, Mich.—The Traverse City State Hospital will receive bids until 5 p.m., Sept. 7, for furnishing approximately 7000 tons of a bituminous coal suitable for automatic chain grate stokers; 5000 tons is to be delivered as directed before Jan. 1, and the balance before Apr. 1, 1916. Bidders should specify the grade of coal they propose furnishing and the price f.o.b. track Traverse City, Mich. All bids must be accompanied by an analysis of the coal. Address Steward George B. Pike, Traverse City State Hospital, Traverse City, Mich.

Contracts Awarded

Note—Successful bidders are noted in **bold face** type.

No. 793—Atlanta, Ga.—This contract (Vol. 7, p. 1005), which provides for furnishing the Georgia Railway & Power Co. with coal for its gas department, has been awarded to the **Harland Coal Co.,** of Pineville, Ky. About 10,000 tons of gas coal will be delivered on the contract this fall. The price has not been made public. Address Mgr. Richard C. Congdon, Georgia Railway & Power Co., Gas Department, Atlanta, Ga.

+No. 873—Springfield, Mo.—This contract (Vol. 7, p. 1086, Vol. 8, p. 233), which provides for furnishing the Board of Education with approximately 1400 tons of screened Kansas lump coal, has been awarded to the **Springfield Coal, Ice & Transportation Co.,** its bid being considered the lowest and best. Address Secy. Edward J. Hoffman, Bd. of Edu., Springfield, Mo.

No. 922—New Orleans, La.—This contract (Vol. 7, p. 1127, Vol. 8, pp. 157, 246), providing for the fuel requirements of the School Board at this place, was awarded to the **W. G. Coyle Coal Co.,** of New Orleans, whose bid was $3.85 per ton for more than 1000 tons of bituminous and $8.35 and $8.45 for 500 tons of egg, and stove and nut, respectively. Proposals were received as follows:

	Coal	Volitile	B.t.u.	Price
Cahaba Red Ash Co.	(Galloway)	34.96	12,856	$3.60

Pittsburg Coal Co. (nut)	8.75
Robert P. Hyams Coal Co.	8.75

Address Purchasing Agent, New Orleans School Board, flourth floor, Municipal Bldg., New Orleans, La.

+No. 960—Harriman, Tenn.—This contract (p. 41), which provides for furnishing the Harriman Water and Light Department with its coal requirements during the ensuing year, involving approximately 2160 tons of coal, has been let to **Church & Co.** Address R. Walzl, Harriman Water and Light Department, Harriman, Tenn.

1057—Superior, Wis.—This contract (p. 116), which provides for furnishing the Board of Education with its annual supply of coal, involving approximately 2500 tons of lignite, has been awarded to the **Donley Dray & Storage Co.** at $2.89 per ton. There were 15 other bidders on this business, all of whom quoted $3.50 per ton. Address Secy. L. A. Nichols, Bd. of Edu., Superior, Wis.

+1076—Ashtabula, Ohio—As previously noted, this contract (pp. 117, 325), which provides for furnishing the local Board of Education with coal and water, has been awarded to the **Ashtabula Coal Co.** at $2.58 per net ton delivered. Bids were received on the contract as follows: Crystal Ice Co., Oakdale, $2.62½ per ton, Moon Run $2.62½, Bessemer $2.30, thick vein $2.55; M. C. Robinson, Oakdale, $2.60, Clifton $2.50, Moon Run $2.70, Prior Penobscot $2.40; F. C. Horton, not specified, $2.53; Aten Coal Co., Oakdale, $2.75; **Ashtabula Coal Co.**, Oakdale, $2.58; not specified, $2.52. Address Clk. Charles E. Peck, Bd. of Edu., Ashtabula, Ohio.

+1089—St. Louis, Mo.—This contract (p. 117), which provides for furnishing the Water-Works Department with approximately 34,000 tons of egg coal and 37,000 tons of screening, has been awarded to **Donk Bros. Coal & Coke Co.** at the prices noted in the accompanying table. Complete list of bids received, including cost of delivery with the freight rate of 57½c. per ton, was as follows:

	Lump	Egg	Screenings
Donk Bros. Coal & Coke Co.	$1.47	$1.44	$1.13½
St. Louis & O'Fallon Coal Co.	1.72½	1.77½	1.37½
Southern Coal, Coke & Min. Co.	1.62½	1.62½	1.32½
Polar Wave Ice & Fuel Co.	....	1.52½	1.27½
Boehmer Coal Co.	1.55½	1.54½	1.14½

Address Board of Water Commissioners, St. Louis, Mo.

1099—Jefferson City, Mo.—The State Commissioners of Missouri have awarded to **John W. Riner**, of Jefferson City, the contract for furnishing coal to the various state departments for the fiscal year beginning Oct. 1 (p. 157). His bid was $2.89 a ton f.o.b. Missouri Pacific cars at Jefferson City. The specifications called for No. 2 Carterville washed nut coal or its equivalent. The Southern Coal, Coke & Mining Co., St. Louis, offered to supply Southern Sootless No. 2 at $2.65. The other bids were as follows: Bald Eagle Mining Co., St. Louis, $2.95; West Virginia Coal Co., St. Louis, $2.92½; J. C. Johnson, Jefferson City, $3; Peabody Coal Co., Chicago, $3; Devoy & Kuhn Coal Co., St. Louis, $2.97; Chicago, Wellington & Franklin Coal Co., Chicago, $2.95. The contract was let last year at $2.97½. Address Secy. Cornelius Roach, Com. of Gov., Jefferson City, Mo.

1101—Urbana, Ohio—This contract (p. 157), which provides for furnishing the county commissioners with coal, has been awarded to the **Gaumer Coal Co.** Address County Audr. O. E. Eby, Bd. of County Comrs., Urbana, Ohio.

+1108—Sharpsville, Penn.—This contract (p. 157), which provides for furnishing the local School Board with 150 to 200 tons of coal, has been awarded to **C. B. Kantner** at $2.35 per ton for Pittsburgh ¾-in. screenings. Coveret & Stewart bid $2.38 and Eckles & Boyd $2.35 for the same fuel. Address Secy. H. B. Wert, Sharpsville Dist. School Bd., Sharpsville, Penn.

+1111—St. Joseph, Mo.—This contract (p. 157), which provides for furnishing the local Board of Education with approximately 4000 tons of coal, has been awarded to the **Central Coal & Coke Co.** at $3.10 per ton for 1¼-in. shaker screen coal from Beaver, Mo. The cost includes delivery to schools. This contract last year was filled at $3.17 per ton. There were eight other bids on the business. Address Secy. A. L. Loving, Bd. of Edu., St. Joseph, Mo.

+1112—Natrona, Penn.—This contract (p. 157), which provides for furnishing the Harrison Township School Board with coal, has been awarded to **Edward Koenig**, at 8c. per bu. for nut coal. Address Secy. Percy M. Kennedy, Natrona, Penn.

+1117—Rockville, Ind.—This contract (p. 158), which provides for furnishing the local School Board with approximately 5000 bu. of coal, has been awarded to **Henry Kinney**, at $2.20 per ton for 4-in. screened coal. Address Secy. O. M. Teague, Bd. of Edu., Rockville, Ind.

1120—New Orleans, La.—This contract (p. 158), which provides for furnishing local school board with its coal requirements during the ensuing year, has been awarded to **W. G. Coyle & Co.**, of this city, at $3.85 for bituminous and $8.35 to $8.45 for anthracite. Address Secy. E. A. Williams, Bd. of Edu., Municipal Bldg., Carondelet & Lafayette St., New Orleans, La.

Contract Notes

Globe, Ariz.—The contract for furnishing the Copper Queen Mining & Milling Co. with 200 tons of coke per day has been awarded to the **Victor American Fuel Co.**

Louisville, Ky.—The Peerless Mfg. Co. at this place consumes from four to six cars of bituminous nut and slack per month. Deliveries are made by railroad and they have a storage capacity of two cars.

Rumford Falls, Me.—The several mills of the International Paper Co., at this place, are substituting oil for coal, the first cargo of oil having already arrived. Other paper mills in this vicinity are expected to follow suit.

Hampton Roads, Va.—Among contracts recently closed here was one for supplying the interned German cruiser "Wilhelm" with about 1000 tons which is to be used for cooking purposes, refrigeration, etc., while the ship is at the dock.

Pawtucket, R. I.—The contract for the Lorraine Mfg. Co., involving 12,000 tons of New River and buckwheat coal per annum (p. 246) should have stated that deliveries were at the rate of 1000 tons per month instead of 100 tons. Address, W. H. Jollie, Lorraine Mfg. Co., Pawtucket, R. I.

Philadelphia, Penn.—The North Bros. Co., consumes about 50 tons of bituminous coal per month. Deliveries are made by railroad, and they have a storage capacity of 300 tons. Address, Purchasing Agent, North Bros. Manufacturing Co., Lehigh Ave. and American St., Philadelphia, Penn.

Saginaw, Mich.—The Arlington & Curtis Mfg. Co., at this place, consumes about 45 tons of mine-run coal per month. Deliveries are made by railroad and wagon, and mine-run coal from Saginaw mines is used. Address, Purchasing Agent, The Arlington & Curtis Mfg. Co., Holden, Saginaw, Mich.

Philadelphia, Penn.—The Sanquirt Silk Mfg. Co. consumes about 3500 tons of No. 2 buckwheat per annum. Their storage capacity is 1000 tons and the deliveries are made by railroad at the rate of 250 to 300 tons per month. Address Pur. Agt. L. G. Schlehner, 4015 Clarissa St., Philadelphia, Penn.

Tacony, Penn.—The Ross-Tacony Crucible Co. of this place consume about 100 tons of bituminous, 1100 tons broken and 300 tons buckwheat coal per annum. They have a storage capacity of 200 tons and deliveries are made by railroad. Address Purchasing Agent, Ross-Tacony Crucible Co., Tacony, Penn.

Philadelphia, Penn.—The Quaker City Flour Mills consume approximately 7500 tons of buckwheat coal per annum. Deliveries are made by railroad, and their storage capacity is 300 tons. They have no specific time for contracting. Address, Pur. Agt. L. G. West, Fourth and Market St., Philadelphia, Penn.

St. Bernard, Ohio—The M. Werk Co. at this place consume from 5000 to 6000 tons of nut and slack coal per annum. Deliveries are made by railroad at the rate of 100 to 150 tons per week, and they have a storage capacity of 200 tons. Address Pur. Agt. A. G. Schwartz, care of The M. Werk Co., St. Bernard, Ohio.

Philadelphia, Penn.—The Philadelphia Sash Weight Works at this place consume about 50 tons of anthracite pea and 100 tons of 72-hr. Connellsville coke per annum. They have a storage capacity of 80 tons and the coke is delivered at the rate of 21 tons per week via the Pennsylvania R.R. Address Purchasing Agent, Philadelphia Sash Weight Works, 22nd and Glenwood Ave., Philadelphia, Penn.

New Orleans—The contract for furnishing the New Orleans Custom House with coal for the fiscal year ending June 30, 1916, was awarded at $3.15 per long ton. As noted in the previous issue (p. 246), the contract went to the **Robt. P. Hyams Coal Co.** Other bidders on the contract were: Tennessee Coal, Iron & R.R. Co., $3.38; Jung & Sons Co., $3.38; C. A. Andrews Coal Co., Ltd., $3.25; Pittsburgh Coal Co., $5.65. The contract involves approximately 1200 long tons and the successful bidder agreed to furnish coal having a B.t.u. value of 13,800 "as received." Address, the New Orleans Custom House, New Orleans, La.

Atlanta, Ga.—Bids on the contract for supplying the local water-works department with approximately 18,000 tons of coal ranged from $2.27½ to $2.75 per ton, which is considerably lower than last year's figures. The bids were submitted by eight firms as follows. R. O. Campbell Coal Co.; Brushy Mountain Coal Co.; Tennessee & Southeastern Coal Co.; Sewanee Coal Co.; Randall Bros. Coal Co.; Atlantic Ice & Coal Co.; Continental Coal Co., and the Durham Iron & Coal Co. The samples submitted are now being tested, and contracts will be awarded according to their merits. Address, City Pur. Agt. W. E. Chambers, Atlanta, Ga.

COAL AGE

Vol. 8 NEW YORK, SEPTEMBER 11, 1915 No. 11

Be A Sport!

By BERTON BRALEY

LET'S be good sports about it. About what? About everything, business, life, work, love and play.

There isn't any better recipe for living than that, anyhow.

Because the good sport accepts life as it is, tries to make it better, takes good fortune gratefully and bad fortune bravely and never loses heart.

So let's be good sports.

Business isn't as flourishing as we wish, perhaps, but we won't improve it by grouching or by being in a blue funk. In fact, we make it worse.

Let's be decently cheerful about it and determined that it must be better.

And if enough of us feel that way, it will be better, because that's the psychology of trade.

The way the average American business man has been sitting forlornly at his desk and grumbling over hard times and the war has been a great disappointment to those of us who thought that he would go out and gather in the trade of the world while the other nations were endeavoring to obliterate each other.

There wouldn't be anything unsportsmanlike in going after that business.

If Bill Smith and Tom Jones, who have been selling potatoes to Dick Brown, suddenly mix it in the street and use up all their potatoes as weapons, Dick Brown still needs potatoes and Jim Black isn't a bum sport if he supplies Dick.

But he's a mighty bad business man if he sits by with his own wagon full of potatoes, and moans, "Oh dear, oh dear, the potato business has all gone to pieces! Look how Bill and Tom are throwing them away."

Let's stop fussing and fretting and muttering, let's wake up and perk up, play the game, go after the prize.

Let's be good sports.

Herbert Mine of the Connellsville Central Coke Company

SYNOPSIS—At a mine in the coke district of Pennsylvania the output of 700 cars was formerly hauled by 29 horses. A gasoline locomotive was installed, and the output was thereby increased to 850 cars, despite the fact that 5 horses and 3 drivers were dispensed with and the haulage distance was increased. Another locomotive has been installed to increase both the output and the efficiency of the haulage system.

The Herbert mine of the Connellsville Central Coke Co., at New Salem, on Dunlaps Creek, Fayette County, Penn., produces about 1700 tons of coal per day, and about 650 tons of coke are produced in 210 rectangular ovens, 105 of which are drawn daily. All the coal mined which is not used for making coke in the 210 rectangular ovens at Herbert is shipped a distance of two miles to the Connellsville Central Coke Co.'s "Low Phos." works and coked in the 210 beehive ovens at that plant.

HERBERT MINE OF CONNELLSVILLE CENTRAL COKE CO. AT NEW SALEM, FAYETTE COUNTY, PENN.

The mine is equipped with 386 Wolf safety lamps and is classed by the inspection department as a gaseous operation. It is ventilated by a Clifford fan, 18 ft. in diameter and 8 ft. wide. At 70 r.p.m. this fan will deliver 185,000 cu.ft. of air per min. It is driven by direct-connected Porter-Allen engines. The power plant is equipped with two 100-kw. 250-volt direct-current Westinghouse generators direct-connected to Ball engines. The air for two Sullivan and eight Ingersoll coal punchers is compressed in two 24&14½x22x24-in. Norwalk air compressors of 1380 cu.ft. per min. capacity compressing the air to 100 lb. pressure.

The boiler plant is equipped with six Phoenix and two Titusville boilers having an aggregate output of 1200 hp. The hoisting engine was manufactured by the Vulcan Iron Works and has cylinders 24 in. in diameter with 48-in. stroke. The hoisting drum measures 8x10 ft. and operates self-dumping cages.

The steel tipple was built by the Fort Pitt Bridge Works, of Pittsburgh, Penn. It has a capacity of 2000 tons per 9-hr. day. Everywhere the equipment is substantial. The offices and the commissary form together a large two-story building 48 ft. wide and 76 ft. long.

The Former Haulage System

With this equipment the haulage system was strangely in contrast. Twenty-nine horses hauled the output of 700 cars, to the haulage rope or to the shaft bottom as the case might be. The coal from some of the flats was handled independently of the haulage rope. This represented a net tonnage of only 41.5 tons per horse, the tonnage per unit being low, not only because of the excessive length of haul, but because of the heavy grades. These averaged 6.5 per cent. in the butt headings. The situation evidently needed corrective treatment.

The mine was by no means small, each of the flats being as extensive as small mines in themselves with most of the coal being drawn in retreat from the boundary lines of the property. The early operations had consisted of heading and room driving, the rooms being only about 12 ft. wide and being spaced at 80-ft. centers.

The main haulage is supplied by a 24x36-in. first-motion single-drum Vulcan haulage engine which handles 24-car trips from the various flats. The rope runs up the manway and down the main road.

Four hundred mine wagons are used in hauling the coal. These are of 44-in. track gage and have a capacity of approximately 4000 lb. per car. The cars weigh when empty about 2000 lb. As the daily output is 1700 tons, it is about twice the capacity of the mine cars.

On all main haulageways 40-lb. rail is used, and on the flats and subsidiary butts the rails weigh 25 lb. per yd. The joints are all fishplated, and the track is well ballasted and carefully graded.

To increase the output, John C. Neff, the general manager, purchased a gasoline locomotive, a 5-ton machine of that type having been successfully operated in a mine under his direction at Crucible, 2 mi. north of Rice's Landing, Greene County, on the west bank of the Monongahela River.

That locomotive had given complete satisfaction. Writing to the editor in reply to an inquiry on Oct. 19, 1914, Mr. Neff stated that the gasoline locomotive "is a great revelation in the economic haulage and safe operation of mines wherever the grades permit it to be worked." He also stated that the locomotive had done more than had been claimed for it and had exceeded his expectations.

There were some special reasons in favor of the gasoline locomotive at the Herbert mine, but its adoption was not based so much on these special conditions as on the excellent performance of the locomotive at Crucible. At the Herbert mine the introduction of electric mine locomotives would have involved increasing the power plant, wiring the mine and bonding the rails. This would have been more expensive than purchasing gasoline locomotives. The purchase and installation of compressed-air locomotives would have been a still larger investment.

Furthermore, had electric locomotives been used it probably would have been necessary to change the ventilation so that the haulage could be conducted on intake air. It had been customary to use the return for a haulageway, and this is the plan under which the gasoline locomotive gives the best results.

The headings are nowhere less than 6 ft. high and are usually higher. In these roadways of course the gas is not allowed to gather, but if it should, it would be unlikely to descend to the level of the locomotive. An electric locomotive discharges sparks liberally near the roof, and if there is any gas to ignite it can hardly fail to set that gas on fire. But for ignition to occur with a gasoline locomotive the gas must be found near the level of the cylinders and the whole roadway must be in a most dangerous condition.

Relative Safety of Gasoline Engine

The danger of gas ignition has been safeguarded by every known method in the design and building of the gasoline locomotive, installed in the Herbert mine. Of course every locomotive will make sparks when starting on a sanded rail or when the brake is operated, but apart from this risk these gasoline locomotives are not likely to set fire to gas even when present in dangerous quantities.

The exhaust would of course constitute a danger, but in this locomotive it is carried direct from the engine to a deodorizing tank, which at the option of the mine inspector can be run empty or filled with water. If the inspector considers that the mine is very gaseous and operation is dangerous, this deodorizing tank can be filled with water, and thus the exhaust from the engine can be prevented from reaching the atmosphere till it has been cleaned by a water bath. Thus all carbon is eliminated and no flame can possibly issue from the exhaust.

The fact that the mine was not new had no bearing on the decision to install a gasoline locomotive, though the older a mine the more forcibly is the purchase of such equipment indicated. The narrowing area to be mined and the great expense of installation of any system needing to be supplied with power from the power house, all argue for detached units such as gasoline locomotives. But as stated, the choice was not made owing to these facts, for at the Crucible Fuel Co.'s plant the area to be mined is 4500 acres and the plant was entirely new, yet the gasoline locomotive was introduced. Had the manager preferred some other form of haulage, it could have been readily installed.

The gasoline locomotive selected was manufactured, like that in operation at the Crucible Fuel Co.'s plant, by the Milwaukee Locomotive Manufacturing Co. The first supplied was a 5-ton machine which was shipped to the mine Sept. 29, 1914. It pulls 15-car trips in No. 5 flat right and 20-car trips in F flat on the left, the latter being a one-way haul of approximately 2000 ft. and the other being roughly half that length. The cars are delivered to the rope at the main butt entry.

Grades Partly Against the Load

The grades on both headings are partly in favor and partly against the load. Thus in the No. 5 flat there is a grade which averages 1¾ per cent. against the load extending for the whole distance between two of the butt entries, and in F flat there is a grade averaging about 1.2 per cent. against the load and nearly 1200 ft. long. It is easy to see that conditions more favorable might have been chosen. The operating expenses are as follows:

HEADFRAME, BOILER, POWER HOUSE AND STORAGE BIN AT HERBERT MINE

Locomotive runner per 9-hr. day	$2.75
Trip-rider per 9-hr. day	2.60
11 gal. of gasoline at 12c. per gal	1.32
¼ gal. lubricating oil at 22c. per gal	.06
Cup grease, waste, oil, etc	.05
Total	$6.78

The results obtained from this locomotive were so satisfactory that a duplicate was purchased and shipped to the mine, Jan. 28, 1915. The locomotive is working in C flat on a haul which measures one way 2700 ft. and in D flat where the haul is 3000 ft. one way. Both flats have grades favorable to the load. However, in D flat is a grade about 300 ft. long which runs about 1.1 per cent. against the load. At present each of these locomotives is hauling about 250 loaded cars per day, and handling about 500 tons. It is expected that when certain grades are made more even and when delays are eliminated 300 wagons loaded with 600 tons will be handled by each unit.

For the months of April and May, 1915, the locomotive in F flat and No. 5 right averaged 260 wagons daily, and on this basis the comparative haulage costs per day are as follows:

COMPARATIVE HAULAGE COSTS

Horse haulage:		
11 drivers at $2.60		$28.60
Feeding 11 horses at 50c		5.50
		$34.10
Motor haulage:		
6 drivers at $2.60	$15.60	
Feeding 6 horses at 50c	3.00	
1 motorman	2.75	
1 snapper	2.60	
Gasoline, oil, grease, etc.	1.51	
		25.46
Saving per day accomplished by use of gasoline motor		$8.64

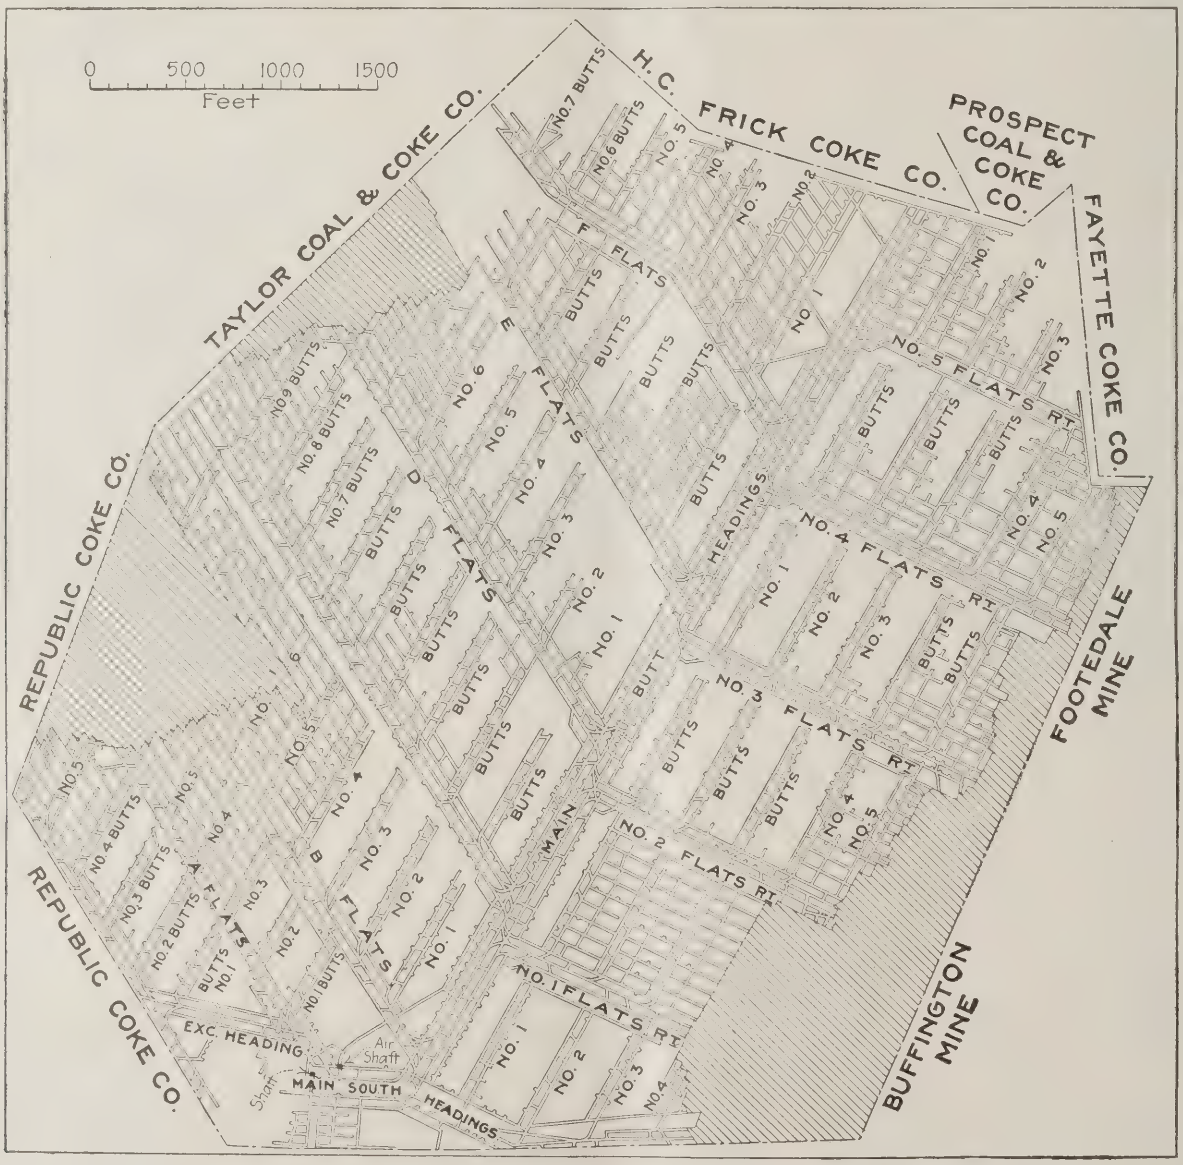
The locomotives when fully equipped weigh 10,500 lb. Overall they are 144 in. long, 55 in. wide and 46 in. high. Their wheels are 18 in. in diameter. The frame is of the open-bar steel type with deep face and steel end sills and with four coupler pockets on each sill. These pockets measure 7½, 10¾, 14¼ and 18 in. from the top of the rail to the pocket centers.

The locomotives are each equipped with 5x6-in. four-cylinder four-cycle engines of the vertical type, specially designed for mine-locomotive service and capable of delivering 25 hp. to the wheels at 800 r.p.m.

The engine is over the front axle, away from the operator, and drives a two-speed transmission direct through a universal coupling. Both the upper and lower sections of the engine crankcase are particularly massive in design and so constructed as to provide ease of access for the inspection and adjustment of the connecting rods and crankshaft bearings.

The transmission drives the rear axle through spur gears and is equipped with two friction clutches—one for forward and one for backward travel.

An electric generator provides current for both the ignition and lighting system, and is driven by a cross-shaft on the gear end of the engine, which permits it to be placed in a readily accessible position. A storage battery furnishes the current for the lighting system when the engine speed is low, and also supplies current for starting the engine. The voltmeter and fuse box with fuses for the protection of the headlights, together with a switch for controlling their operation, are conveniently located on the operator's end plate. The headlights, one at either end of the locomotive, are inclosed in cast-iron cases to protect them from injury, and a plug connection with an extension cord for an operator's trouble lamp is also provided.

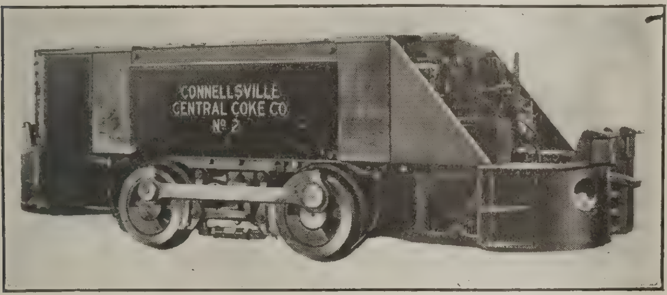


UNDERGROUND OPERATIONS OF CONNELLSVILLE CENTRAL COKE CO.

The cooling system consists of a radiator of special design and rugged construction and a conveniently located centrifugal water pump by means of which the water is kept in circulation and effectively cooled.

A detachable ratchet lever provides means for starting the engine. A safety starting device is also provided and is so designed as to protect the operator when cranking the engine in case of accidental backfire. This device consists of heavy pawls which engage in the rim of the flywheel and are automatically thrown into engagement when the operator throws in the starting crank. With this device, it is impossible to crank the engine without having the safety device engaged, and therefore no accidental backfire can cause any harm to the operator.

The special features in the construction of the locomotive are its open bar steel frame; its steel end sills; a four-cylinder vertical engine weighing 1800 lb. specially designed and built for this service; electric headlights and operator's lamp, with Edison storage battery and a heavy and reliable type of generator so constructed and arranged that lights are operated under all conditions, not only when the locomotive is in operation, but when the engine is running and the machine standing idle, and also when the engine is entirely shut off; a deodorizing tank embodied in the end sill of the locomotive by which the exhaust gases are neutralized; the safety cranking device whereby the operator is effectively protected against back kicks; a radiating system so efficient that these machines can be operated for three or four days at a time with a loss of not to exceed 1 qt. of water; gear and side-rod drive throughout, not a chain being used for power transmission. All the bearings and working parts of the locomotive are of exceptionally heavy and rugged construction and were especially designed for mine service.



TYPE OF GASOLINE LOCOMOTIVE INSTALLED AT HERBERT MINE

⁂

Extracts from a Superintendent's Diary

For several months past we have had only enough demand for our coal to provide our men four days' work each week. On the two idle days they have wandered around like the Lost Tribes of Israel—now at the commissary, next at the railroad depot, then at a game of quoits or marbles at the ball grounds. Some have tried their hand at ball playing, but outside of the regular ball team very few of the men get much pleasure out of base ball, except when they are allowed to act as spectators. For the benefit of that crowd our regular team made strenuous efforts to get up a game with some of our rival neighbors, but the idle days at the different camps seem always to criss-cross.

Some of the men with gardens in their back yards have stuck around home mostly, and some of the others have hung around home pretty much also, much to the disgust of their wives, who would rather have them at work, especially since they grumble so much about the troubles they are going to have making ends meet.

I have been keeping pretty close tab on the doings of the men during the idle days and have come to realize more and more the necessity of devising some plan to furnish them work or amusement to keep their minds occupied while out of the mines. I have considered every suggestion that anyone has been kind enough to offer, and I have watched closely the results my neighbors have accomplished in dealing with the same problem. Last week one of our timber contractors suggested that we might turn all of our men and mules loose in a fallow field that is on company property about one mile from our camp and convert it into a turnip patch.

As a direct result of that suggestion, today has been a day that will be remembered a long time by most of the men, women and children of our camp. Curiosity to know what the mine mules would do when harnessed to plows was sufficient inducement to bring out most of the population, and once on hand as spectators, most of them could not resist the call of the earth, but had to try their hands.

We borrowed the necessary farm implements from our timber contractors, who, as it happens, are all farmers, and with plenty of mules and labor to spare the waste acres were quickly transformed into a planted field.

It proved to be a day of great fun for all who turned out, and the fun started early and continued throughout the day. Even if the seeds refuse to sprout and not a turnip plant raises its head above the ground, no one will regret the day's toil.

The mules also seemed to enter into spirit of the affair, and in spite of the years that must have passed since most of them were taken away from the farms where they were born, led off when put into harness in front of a plow, just as if plowing was everyday work for them. This was rather disappointing to some of the small boys who had looked forward to "Maud stunts" from some of the contrary mules with reputations to sustain.

A few more days like today and we would have enough turnips in prospect to supply the entire neighborhood during the coming winter. And the best part of it is that nearly every citizen of the camp would have an interest in the returns—a regular family affair, as it were.

⁂

Wanted--An Engineer

Important and responsible mining interests wish to employ a safety and efficiency engineer who is thoroughly experienced and fully acquainted with general mining conditions in the United States. The man desired must be entirely familiar with all devices of life-saving practice such as are adapted for the prevention of accidents in and about mines.

Anyone who feels qualified to make application for this position should write to the Editor of *Coal Age,* stating briefly his experience and training in the lines designated. All applications will be kept in strictest confidence and will mmediately be submitted to the people desring such a man.

Power-House Chimneys for Steam Sizes of Anthracite

By Reginald Trautschold, M. E.*

SYNOPSIS—The draft required to burn coal may be divided into three parts—(1) that necessary to force the proper amount of air through the grates and fire bed, (2) that necessary to pull the products of combustion through the boiler, economizer and breeching to the base of the stack, and (3) that necessary to propel the gases up the stack and eject them. Much larger and higher stacks are required for buckwheat No. 3 than are necessary for pea coal.

About a hundred years ago it was not believed that anthracite coal could be burned. The first anthracite taken to Philadelphia, in 1803, defied all attempts at ignition and was finally broken up to furnish material with which to build a walk. A few years later, when Col. George Shoemaker sold a few wagon loads of it to some of the more advanced, or it might have been more ignorant, Philadelphians, warrants were issued for his arrest on the charge of taking money under false pretenses.

Today close to 100,000,000 tons of anthracite are mined in a single year, a large proportion of which is burned for power generation. So valuable has become this coal supply that only the smaller sizes can now be afforded for power purposes. Pea is about the largest size now burned under steam boilers, and within recent years even buckwheat No. 3 has become quite a common steam fuel.

Anthracite Is Burned Uneconomically

There is no question as to the ability of burning anthracite today, but there is a decided question as to whether much of the anthracite that is now consumed is burned economically or efficiently. To burn the steam sizes successfully, without the assistance of mechanical draft, requires chimneys of considerable height. The necessary stacks are far higher than any that could have been conceived a hundred years ago. The pioneers in the burning of anthracite would have considered a chimney of over 700 ft. in height, such as that of the Woolworth Building in New York City, even more of an impossibility than the burning of the supposedly incombustible material that they had been beguiled into buying.

Such a chimney is, of course, exceptional, and it is doubtful if this height record will again be equaled, except in some other skyscraper that permits such construction without unduly exorbitant cost, for the intensity of the draft secured by such a tall stack can be realized at a much lower initial cost by the installation of some kind of mechanical-draft equipment. Many power houses still depend entirely upon natural stack draft, however, and it would be little exaggeration to say that there is more money wasted in chimney construction than in any other equipment pertaining to the power house. Much of this waste cannot be avoided, it is true, but the correct design of chimneys is such an important consideration that any investigation of the subject is decidedly worth while.

A chimney is nothing more than an inefficient type of air pump that is affected by numerous conditions over which little control can be exercised. For instance, in localities where the temperature may drop to zero in the winter and approach the 100-deg. mark in the summer, the natural stack draft would be only about one-half as great on the hot day of the year as on the coldest day of the winter season.

This peculiarity possesses an actual advantage, however, for the chimney having perforce to be proportioned for adequate capacity in the summertime can usually accommodate the extra fuel that has to be burned in the winter for heating purposes without exceeding its capacity. Nevertheless this constitutes a waste, or inefficiency, since during the greater part of the year the chimney has to be operated far below its capacity.

The intensity and direction of winds also have considerable influence on the natural stack draft, with no redeeming advantage that can be counted upon. The shape of the stack and the material of which it is constructed also affect the available draft that a chimney can create. All in all, correct chimney design is an intricate matter—one that must necessarily be based on the most trying conditions that may exist and which perforce makes every chimney an inefficient piece of equipment.

What a Chimney Must Do

The work imposed on a chimney may be divided into two kinds: (a) It must create a draft sufficient to draw the requisite quantity of air through the firebed, draw the products of combustion through the boiler, fuel economizers or other heat reclaiming equipment, and through the breeching to the base of the stack. (b) It must produce the draft necessary to carry the products of combustion up the chimney and discharge them to the air.

The first requisite is dependent upon so many variable conditions as always to be a matter of conjecture when laying out a plant. In fact, even after a plant has been in actual operation and this value becomes known for certain conditions, these conditions can never be fixed, so that the furnace draft always remains decidedly unstable.

The draft necessary to carry the exhaust gases up the chimney also depends upon unreliable conditions—climate, temperature, winds, etc.—which require differing temperatures for the gases of combustion on delivery to the stack, if the draft is to remain constant. It is no wonder, therefore, that many power-house chimneys are inefficient—inefficient in being more powerful than necessary to meet economically even the trying demands made upon them.

If the grates are kept in good operating condition, the firebed free from undue accumulation of ashes, etc., the heating surfaces of the boiler and all passages to the base of the stack clean, the intensity of draft required for drawing the products of combustion through the furnace, or the furnace draft, depends upon the kind of fuel consumed and the rate of its combustion. Ordinarily, the smaller the coal the greater the draft required. For instance, considerably higher draft is required to burn buckwheat No. 3 than would be necessary to burn pea at the same rate of combustion. The increase necessary is pretty accurately known for average conditions, as is also the draft required to burn buckwheat Nos. 1 or 2 at the same rate.

---

*Engineering economist, 42 Bank St., New York City.

The furnace draft needed to successfully burn any of the four steam sizes of anthracite may be considered as being required for two distinct operations—first, to draw the required amount of air through the grates and firebed into the combustion chamber and, second, to draw the products of combustion from the combustion chamber to the base of the stack.

The draft necessary for the first operation depends upon the size of coal consumed and upon the rate of combustion. For the second operation, the draft in the average well-designed and proportioned boiler is fairly constant at a given rate of combustion for boilers either with or without fuel economizers or other waste heat absorbing devices.

Furnace Draft May Be Accurately Computed

The furnace draft may be pretty accurately calculated for any well-designed boiler. The draft required to carry the exhaust gases up the chimney, though considerably less than that needed to draw them to the base of the stack, is nevertheless quite an appreciable proportion of the total draft.

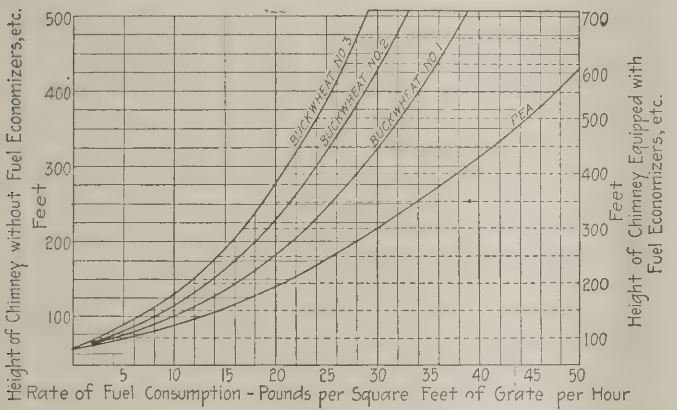


CHART 1. HEIGHT OF CHIMNEY REQUIRED FOR VARIOUS RATES OF COMBUSTION

The draft required to move the gases from the combustion chamber to the base of the stack, other conditions remaining the same, depends upon the temperature of the gases on delivery to the stack. This temperature in turn depends upon the efficiency with which the boiler is operated. It should therefore be taken as that temperature occurring under the best operating conditions, and may consequently be considered as fixed.

The total draft (natural) is dependent, of course, upon the height of the chimney, or the difference in elevation between the fuel bed and the top of the stack. This height consists of the sum of the heights necessary to create (a) the draft requisite for drawing the products of combustion from the combustion chamber to the base of the stack. This is a certain constant height for boilers with fuel economizers, etc., at a given rate of combustion and another fixed height for boilers without such heat reclaiming devices, and in either case is quite independent of the kind of fuel consumed. (b) Another height is necessary for the creation of the draft required to draw the requisite air through the firebed, etc. This depends upon both the rate of combustion and upon the size of coal burned. (c) Still another height is required for creating the draft necessary to elevate the products of combustion from the base to the top of the stack. This height must necessarily be taken as fixed and therefore that required during the hottest day of the year.

Ordinarily these three subheights are not calculated, empirical formulas being employed for arriving at the total height of stack. Probably such practice is justified by the fact that, at best, calculated heights must be liberal in order to meet the most exacting conditions that are liable to arise.

Based on results from a conservative formula for ascertaining chimney heights, checked and modified so as to accord with results attained in actual practice, the necessary heights of chimneys for various maximum rates of consumption of the four sizes of anthracite steam coals are graphically depicted in Chart 1. The data so presented is conservatively accurate for installations in most localities in the United States, but where the summer temperature is apt to go above 100° F., slightly higher chimneys should be employed.

A Chimney Less Than 60 Ft. High Is Useless

Some interesting points are brought out by this graphic presentation of facts, which are too seldom realized. For instance, if steam sizes of anthracite are to be used in a power house and no mechanical draft equipment is installed, a chimney less than 60 ft. in height is practically valueless, even if fuel economizers are not installed. If fuel economizers are employed, the chimney would have to be nearly 85 ft. in height before any fuel could be burned on the grates; the installation of such heat-reclaiming devices adds something like 37½ per cent. to the necessary height of the chimney.

The most striking fact brought out by the chart is, however, the alteration necessary in height of chimney when changing from the use of one grade of fuel to one of lower grade. As an example, if a plant without fuel economizers is to be operated on pea consumed at a maximum rate of 25 lb. per sq.ft. of grate per hour, the chimney necessary to produce the requisite natural draft would be about 175 ft. in height. Should it be advisable to change the plant fuel and burn buckwheat No. 3, the height of chimney necessary to secure the same rate of combustion would have to be approximately 385 ft.

Even with such a chimney, however, the same steaming capacity could not be attained, on account of the lower heating value of the fine coal—a more rapid rate of combustion would be necessary. The average relative heating values of pea and buckwheat No. 3 vary about as 1.5 : 1, so that the rate of combustion, in order to secure the same steaming capacity for the plant operating on the lower grade of fuel, would have to be increased to about 37½ lb. of buckwheat No. 3 per sq.ft. of grate per hour. Besides requiring a larger stack (greater in cross-sectional area) to accommodate the greater volume of exhaust gases, the chimney would have to be of entirely impractical height, unless mechanical draft equipment was installed—the necessary height being probably close to 1000 ft.

Though changing the plant fuel from pea to buckwheat No. 3, when the necessary maximum rate of combustion of the larger coal is 25 lb. per sq.ft. of grate per hour, would be quite out of the question, unless mechanical draft was resorted to, it might be possible to use buckwheat No. 1 to advantage. To secure the necessary draft for maintaining the rate of combustion with the lower-grade fuel, the chimney would have to be increased in height to about 245 ft. To secure the same steaming capacity, the rate of maximum consumption would have to be increased to 25½ lb. per sq.ft. of grate per hour, the relative heating values of pea and buckwheat No. 1 being about as 1.02 : 1, which would necessitate a chimney about 255 ft. high.

Disregarding the fact that in order to secure similar chimney efficiency the cross-sectional area of the stack should be somewhat increased, changing the plant fuel to buckwheat No. 1 would necessitate a chimney nearly 50 per cent. taller than the efficient height of chimney when burning pea. The cost of building a chimney 50 per cent. higher than another is more than 50 per cent. greater, both on account of the greater difficulties of construction and the fact that the foundation required for the taller chimney would be considerably more expensive than that necessary for the shorter stack. The difference in initial cost would be about 70 per cent. Remodeling a chimney would entail even greater expenditure, so that a conservative estimate of the cost of remodeling a chimney so as to increase its height 50 per cent. would be about equal to the cost of the original chimney.

A Larger Stack Is Necessary for the Smaller Sizes

The foregoing does not take into account the increase in cross-sectional area of stack required to accommodate the greater volume of exhaust gases. The cross-sectional area of the stack is of even greater importance to efficient boiler operation than is the stack height.

A stack that is too low for natural draft operation can still be used if its draft is supplemented by that from some mechanical-draft equipment. A chimney of some kind is always required to carry the products of combustion to a sufficient height to allow their proper diffusion with the atmosphere.

The size of chimney, likewise, must meet certain requirements. It must always be ample to receive the output of the breeching without creating undue resistance by throttling or the formation of dead spaces in the boiler due to the difficulty of the gases passing into the breeching. This accommodation must be capable of caring for all the exhaust gases at the maximum rate of combustion. This is true regardless of whether natural or mechanical draft is employed and is about the only condition that permits of no variation.

Of course the grade of fuel consumed affects the question, for the size of chimney is not dependent upon the heating value, but upon the total weight of fuel consumed in a given time and the quantity of air that must be admitted for its proper combustion. Leakage through the boiler setting, etc., has also to be counted on, and as more air is required for hand firing than when employing automatic stokers, it is usually advisable to proportion the stack capacity to care for the maximum possible demands.

The shape of the stack's cross-section and the nature of its internal surface modify the carrying capacity of a chimney, but as stacks are almost invariably either round or square, of steel or masonry construction, definite sizes for any rate of combustion can readily be calculated for "standard" chimneys. A circular steel stack permits the smallest cross-sectional area; a circular masonry chimney or a masonry-lined chimney requires a cross-sectional area about 5 per cent. larger, as does also a square unlined steel chimney; while a square masonry chimney or a square steel chimney lined with brick requires still an additional 5 per cent. in cross-sectional area in order to handle the same amount of exhaust gases.

The relationship between the size of chimney, of various shapes and constructions, and the maximum total coal consumption, based on hand-firing operation, either in pounds or tons per hour, is graphically depicted in Chart 2. With the assistance of this chart, almost any standard type of chimney can easily be properly proportioned, so far as its size is concerned. It provides also a valuable and accurate means of ascertaining whether an existing chimney would permit a change in the grade of fuel employed at the station.

Little Difference in Size of Stack When Using Pea or Buckwheat No. 1

Considering a plant burning pea, the maximum rate of consumption being as before 25 lb. per sq.ft. of grate per hour, with a total grate area of 260 sq.ft., the maximum coal consumption per hour would be 5750 lb., or 2⅞ tons. This, if the chimney had a circular masonry or masonry-lined stack, would require a chimney (stack) diameter of 6 ft. 9 in. Employing buckwheat No. 1 to secure the same steaming capacity would necessitate an increase of about 1½ in. in stack diameter. A chimney 6 ft. 10½ in. in diameter would cost about 2 per cent. more to build than one 6 ft. 9 in. in diameter, the cost for a given height of chimney being about proportional to the quantity of coal consumed at the maximum rate of combustion.

Though such comparatively slight advisable increase in diameter of stack might be overlooked, without much danger of ever overloading the chimney, if the change was from pea to buckwheat No. 1, an increase in diameter would be highly necessary if it were decided to install mechanical draft and use buckwheat No. 3. In such an event, the fuel that would have to be consumed in order to realize the same steaming capacity would be about 50 per cent. more by weight than when burning pea, so that the maximum coal consumption would be 8625 lb. per hr. instead of 5750 lb. This would necessitate a stack nearly 8 ft. in diameter, and the cost of a brick chimney so proportioned would be, for a given height, about 20 per cent. more than that of an equivalent and similar chimney for the use of pea.

The examples cited show directly, not only the heavy expenditures required to make alterations in existing chimneys, but also indirectly the great wastes that are represented by the use of chimneys of greater capacity than that actually required. The converse deductions are every bit as important as those that are brought out directly.

Though the charts presented and the general discussion have aimed to point out facts by which more efficient chimneys can be designed than those so frequently encountered, they serve equally well as guides by which existing chimneys can be modified so as to secure greater economy in the cost of steam generation. For instance, Chart 1 indicates at a glance when it would pay to install fuel economizers in a plant operating on natural draft. If the existing chimney is 37½ per cent. higher than necessary to produce the requisite draft for the most rapid rate of combustion—a state of affairs that is not at all uncommon—economizers could be profitably installed.

As any type of draft equipment is but a substitute for an additional height of chimney, this chart likewise provides a reliable measure of the draft-equipment capacity required for the fuel economizer, so that the exact monetary value of such heat-reclaiming apparatus can readily be calculated for any type of power plant.

Chart 2 is really the more valuable, however, both when designing new chimneys and for investigations of the possibilities of increased plant efficiency from higher rates of combustion, changes in fuel, etc. It is more important to have room for the accommodation of the products of combustion than it is to have a chimney of sufficient height to draw them from the combustion chamber, etc., and discharge them to the atmosphere without assistance of mechanical-draft equipment.

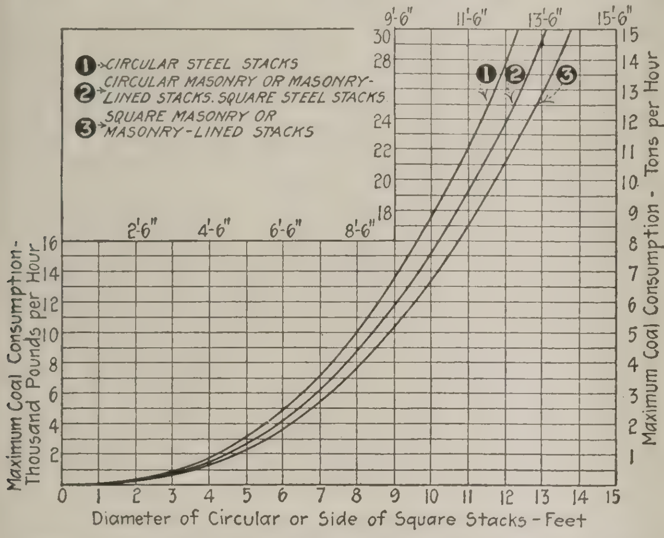

CHART 2. RELATION BETWEEN SHAPE, CONSTRUCTION AND MAXIMUM CONSUMPTION

It is well, therefore, to lay out a new chimney so as to be able to accommodate all the exhaust gases when using the lowest grade coal that the plant is ever liable to employ and at the maximum rate of combustion for that particular coal, not the maximum rate of combustion for the grade of coal for which the plant was planned. With the continually increasing price of coal, particularly anthracite, it is always possible that a plant may eventually realize economies by adopting a lower grade coal for its fuel than that most economical at the time the plant was erected. When such an occasion arises, the ability of the chimney to accommodate the gases from the lower grade fuel often governs the wisdom of the change.

It is more desirable to make the chimney big enough than it is to build it high enough. Most mistakes in chimney construction are made in building too high. The money wasted in such a way could be put to much better use in making the chimneys larger, for then a poorer grade coal could be used, should the necessity or opportunity therefor arise.

Electrical vs. Steam Winding

A few years ago the suggested employment of electric motors in place of steam winding engines would have been scoffed at. Today, as John Gregory recalled in his presidential address before the North Staffordshire Institute of Mining Engineers some months ago, in spite of an enormous increase of depth and load, there are few instances where, in laying out a new colliery, a considerable advantage cannot be obtained by their use.

The length of time occupied in a single wind is so short that the utmost attention must be devoted to the periods of acceleration and retardation, and it is here that the electric motor is particularly advantageous, while its even turning moment contributes to the steady running of the winding rope.

Generally speaking, however, it is only in new collieries that electrification is possible, and as yet the steam winding engine continues to be the principal means of raising coal to the surface in Britain. Mr. Gregory admits that the steam engine is well suited for such work, but the steam consumption is inevitably high, and in spite of the application of various forms of automatic cutoff, it was not until the development of the exhaust steam turbine that a serious waste could be checked.

Since their first application some 8 or 10 years ago, the use of exhaust steam, and more lately mixed pressure turbines, has rapidly extended, and today there are few collieries of any size in England where a plant of this description is not installed, either for the generation of electricity or the compressing of air for supplying auxiliary power.

Wellington Coals in the San Francisco Market

The coal coming from British Columbia is mostly the Nanaimo product mined by the Western Fuel Co. Some Comox coal is also brought down for bunkering purposes. There is little Ladysmith or Boat Harbor coal coming into this market.

The coal mined by the Western Fuel Co. is sold here as New Wellington or short Wellington coal. It took the name and reputation of the Wellington coal mined and introduced into San Francisco by Alek Dunsmuir, who had bunkers and yard at that city. In 1905 the agency for Comox and Ladysmith coal was taken over by the Western Fuel Co., as well as the bunkers and yard referred to, situated at Folsom St. The old Wellington coal originally brought into this market was well liked, and it established the reputation of Vancouver Island coal in general. It had only a feeble competition to contend with at that time, and coal users were not so particular in regard to fuel as they are now. The Wellington has lost much of its old-time glamor. It has been off the market for a considerable time owing to the strike on Vancouver Island. And also Wellington coal coming from Nanaimo is not up to the old standard of the original Wellington as it clinkers.

The Wellington coal is sold in the bunkering trade, for which purposes the Western Fuel Co. is also using some of the screenings. There are also a few thousand tons of Comox in stock at Oakland, which is used for bunkering vessels.

The wholesale price for Wellington coal, as sold to retail dealers, is $7.50 per short ton at this writing. Before the strike the regular price of Wellington coal used to be $8. In Oakland a still better price has been made to dealers in the storage season for coals contracted in quantities of more than 25 tons, for which a price of $7 has been asked. Screenings are wholesale to retailers at $5 a ton, but are difficult to sell and do not bring more than $3.50 to $4.50 in scow-load and carload lots.

Coal Mine Accounting System

By J. C. McNeil*

SYNOPSIS—The financial failure of many coal-mining companies can be traced to a faulty system of accounting. A mine like a bank should so keep its accounts that there will be no loss of capital.

The purpose of any accounting system is not to merely record the debits, or charges, and the credits, or payments and allowances made. Any accounting system which does not thoroughly analyze the transactions and give a complete history of the business is worse than useless.

With manufacturing, mercantile or any kindred business a portion of every dollar taken in revenue goes to increase the assets and to make the business more valuable. It is not so with mining. Every ton of coal taken from a mine decreases the value of the property to that extent. It is highly essential, therefore, that the cost of doing business be known accurately.

I know of a number of men who opened coal mines in the days when anything that was black sold for coal. They enjoyed a reasonable market for the output at a fair selling price. The miners were paid good living wages and there was little dead expense. At the end of every year the books were balanced, and when the bank balance showed up nicely and all the current bills were paid, the remainder was divided among the stockholders.

The years passed, and before they were scarcely aware of it, the mine had been worked out. Some of the stockholders suggested moving to other fields; but then that meant the organization of a new company, and refinancing. All of the stockholders in the old company were not able to go into the new one and enter the other field. The company itself could not make the change, as it had no assets. In the 20-odd years the company had been in business good dividends were paid the stockholders and they consoled themselves with this fact.

Suppose, for example, that they had put their money into bank stock, and at the end of 20 years the bank directors had come to them and said: "Let us have some more money. We have been in business for 20 years and have used up the capital." That would forthwith have called for an investigation; but they would never have gone that long in the banking business using up the capital. A proper accounting system would have prevented it.

In talking with another operator about his cost of doing business, I asked him for details as to his cost of production. The figures were given and they seemed fair enough. However, the item of royalty was missing. "How about royalty?" was put to the operator. Oh, he didn't charge any royalty; he owned the land himself! There is another case of not providing for the future.

It is as essential in getting into coal mining to provide an adequate accounting system as it is to get sufficient capital to enter the business. Some concerns sell their coal at about what it costs them to produce it, and sometimes below the cost of production (because an inadequate accounting system doesn't give the facts), and they depend on their merchandise profits and tenement rentals to pay their dividends. This is a mighty big investment for a mercantile business.

The revenues of a coal-mining company are derived from the sale of coal, from the sale of merchandise to employees, the rental of tenements to employees and from other sources. The principal expenses of a coal mining company are for production of output, maintenance of plants, maintenance of mines, distribution of output (sales) and general (miscellaneous) expenses.

In order that the revenues of the coal mining company may be accurately accounted for, an invoice should be prepared for every sale of coal made, whether the shipment is of one ton or several thousand tons, and the invoices must of course be properly recorded in a sales, or shipping, register. In order that a ledger account may be carried with every party to whom the coal is sold, a sales ledger should be maintained and a controlling account carried in the general ledger with this sales ledger. Thus all of the coal sales will be carried in the general ledger under one account.

From time to time sales of materials that are not purchased to be resold are made merely as accommodations to the purchasers. These are not revenue sales, but are primarily credits to expenses, and in order that proper sales may not be distorted, these invoices should not be carried in the sales account, but in a collection bills account. If the number of sales and bills are sufficient to so warrant, a separate ledger would be necessary.

All expenses should be handled on properly supported vouchers. In fact, all payments should be made by check or voucher, and the only cash that would be disbursed by the treasurer would be in the shape of payments to the bank for deposit on account. True, the payrolls cannot be satisfactorily paid by all companies in the form of a check and will have to be made in cash, but a voucher for the full amount should be drawn.

Other expenditures are made by mines in the way of improvements, additions to existing properties, putting in power plants, etc. These should not go into the expenses. They are sometimes paid for out of the surplus earnings, sometimes by the sale of additional capital, either in the shape of stocks or bonds. For these "capital" accounts, a general ledger account should be set up known as "additions and betterments."

It is a known fact that power plants will not last forever and that every ton of coal removed from the property decreases its value to that extent. These contingencies should be met by reserve funds which are set up as liability accounts and the offsetting charges made to the expense accounts. Some concerns reduce the investment accounts—lands, plants, etc.—by the amount of the charges to their expense accounts and reduce their assets in this manner.

By this method it is their intention to bring the property accounts down to zero by the end of the estimated period when the mine will be worked out. However, the writer's opinion is that the reserve accounts should be set up and the money actually taken out of the business and invested in securities of some kind. This, we believe, would be dealing more honestly with ourselves and would enable us to arrive more definitely at the real cost of production.

---

*Artemus, Ky.

Railroads in their accounts work them out in such a manner as to find what it costs them to move a ton of freight one mile and what revenue they derive therefrom. So should it be with coal companies. The accounts should be kept accurately and the statistics worked out monthly so that it can be readily ascertained what each operation has cost per ton of coal mined. When these statistics are worked out, the operator can tell at a glance whether his price should be $1 or $1.25. If his average selling price is $1 and his costs according to the statistics are $1.07, after taking out his royalty, depreciation of plant, interest on investment, etc., it wouldn't take a seer to tell him to get into another line of business.

When an accounting system of this kind is adopted and the expenses are in plain figures, low prices and selling coal below cost of production to "keep the organization together" will fall by the wayside.

⁂

Automatic Sampling of Coal

A great deal has been written and many discussions have taken place regarding the proper methods to employ to correctly sample coal, says L. C. Bosler in *Power* for Nov. 3, 1914. It seems strange to the writer that some of the larger consumers of coal should continue to use the ancient and crude system of sampling coal by taking a handful or shovelful from each car or bucket unloaded, as the case may be. For a proper analysis of a quantity of coal the first and important thing to get is a representative sample, after which this can be reduced to a working quantity by an automatic machine.

The Philadelphia Rapid Transit Co. has perfected and put in its Beach power station an automatic coal-sampling device by which all of the coal received is sampled without the human element entering into the operation at all.

Coal is received in boats and is unloaded therefrom by two electrically driven locomotive cranes on the pier. The coal is dumped into cars where it is weighed and is then delivered to a conveyor and carried to the crusher. The coal at this point is reduced to a size not greater than 3 in. in diameter. It is then raised to a height equal to the elevation of the top of the coal bunkers and is then conveyed to them. The sampling device is in this last named conveyor.

Referring to Fig. 2, the hopper for catching the major sample is underneath. Beneath this is a No. 00 rotary crusher and automatic sampler, made by the Sturtevant Mill Co., which receives the coal from the hopper. This machine performs two separate and distinct functions; it first grinds the major sample to any desired size and then divides it into two parts, one of which is the final sample, it being drawn from the front spout, while the balance falls back into the bunker through the side spout. By operating the adjusting wheel on the grinder, any proportion desired can be obtained between the final and the major sample.

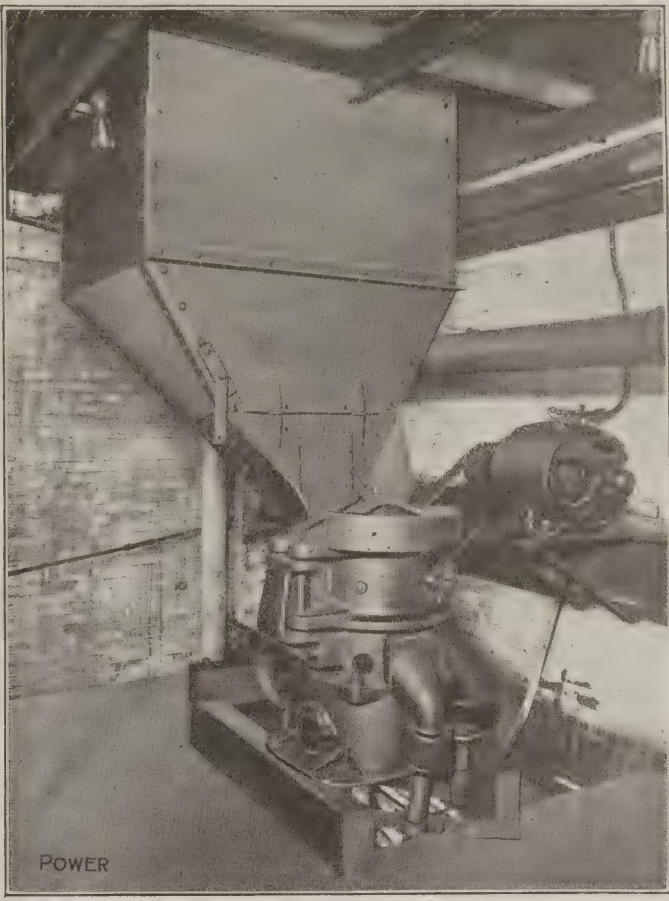

FIG. 1. AUTOMATIC COAL SAMPLER UNDER COAL CONVEYOR

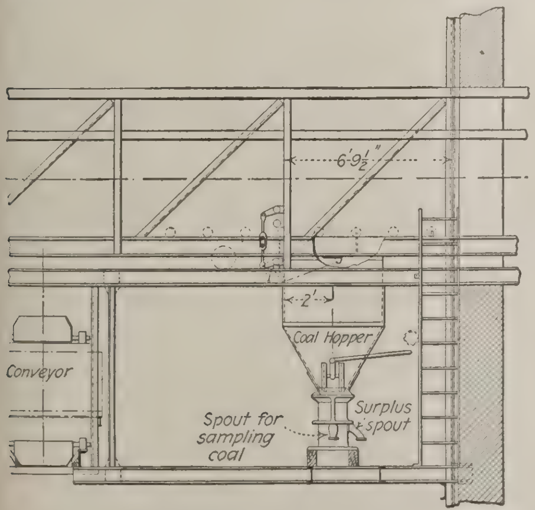

FIG. 2. CONVEYING AND SAMPLING MACHINE

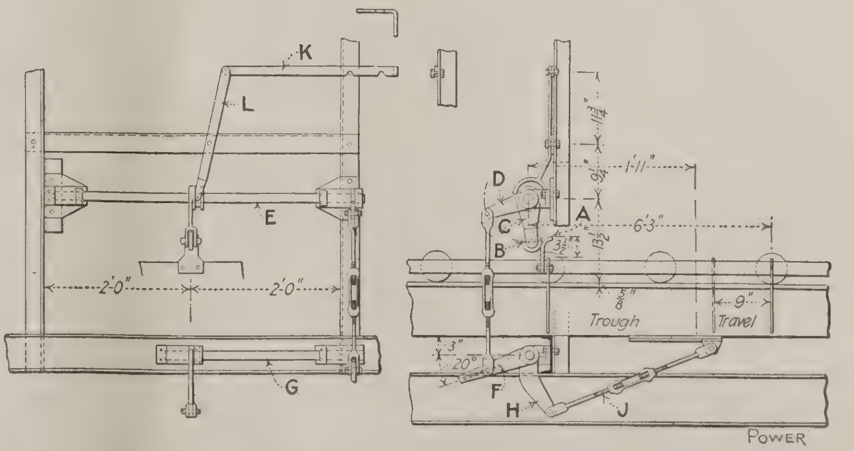

FIG. 3. GATE-OPERATING MECHANISM

Fig. 3 is a view of the gate-operating mechanism. On a flight of the conveyor is fastened a plate *A*. With the movement of the conveyor to the left this plate engages with the roller *B* and thereby raises the arm *C*. With this movement the arm *D* is also raised as both are keyed to the shaft *E*. As the arm *D* raises it pulls up the arm *F*, which, through the shaft *G*, is keyed to the arm *H*. At the end of this arm is fastened the rod *J*, which operates the gate. This gate is closed by the use of a counter-weight attached to the arm *F*. By the pull rod *K*, and yoke lever *L*, the arm *C* can be slid on the shaft *E* out of the path of the plate *A*, thereby cutting the apparatus out of service.

It will be seen that there must be a fixed relation between the position of the flight and the opening of the gate. With the gate wide open when the flight reaches the near side of the hole, the maximum discharge will take place as the coal is always banked against the flight.

The amount of coal desired in the major sample is governed by the number of openings of the gate per revolution of the conveyor and this in turn by the number of arms *A* that are fastened to the flights.

As an example, from each boat load, averaging 800 tons, a major sample of about 1500 lb. is taken. After passing the grinder and sampling machine the final sample is 6 lb.

In Fig. 1 the actual apparatus is shown under the coal conveyor in the boiler room. The two spouts referred to in the foregoing are seen near the bottom of the grinder.

During the recent special tests made by the company on six samples of 1000 tons each, three major samples of 1500 lb. were desired from each cargo. To accomplish this, it was necessary to have four gate openings per revolution of the conveyor, this delivering the required amount. The opening in the bottom of the conveyor trough through which the coal passes to the hopper is 4x6 in. and by actual experiment was found to deliver 3 lb. of coal per opening under ordinary conditions of moisture.

All of the apparatus except the crusher was designed and erected by the company's engineers and has been in continuous service for a year giving excellent results.

Supt. Jones on the New York Coal Specifications

The first test of the new tentative specifications for the purchase of coal for city departments, printed in *Coal Age* of July 24, took place when Patrick Jones, superintendent of supplies of the New York City Board of Education, opened nine bids for furnishing and delivering 23,700 gross tons of No. 3 buckwheat and mine-run coals. Previous to the opening of the bids Mr. Jones had received letters from two coal dealers protesting against the provisions of the specifications, in one instance the writer saying he would not submit a bid.

Mr. Jones refused to make public the names of the dealers, saying he had not yet made his report to the Board of Education, but he did make public his replies to the dealers in which is set forth his opinion of the specifications. In one letter Mr. Jones says:

"I wish to state that before the specifications were approved, the Bureau of Supplies was perfectly satisfied that said specifications would be in keeping with the market conditions. Our experience regarding the ash and B.t.u. for No. 3 buckwheat coal has been that it is always available. Besides, we cannot afford to get coal of an inferior grade, lest the idea which we have in mind be nullified.

"The specifications which we used last year for No. 3 buckwheat coal were practically the same as the present ones. You may recall my visit to your office last year in regard to the regular coal contract. At that time you raised the question of the unfairness of penalties when the contractor frequently delivers coal the quality of which is in excess of our specified requirements. The remission clause in the new specifications has been designed to overcome this difficulty and make the specifications more equitable to the contractor."

The second letter states:

"I was under the impression that the specifications for the present year were more favorable than those we have used in the past. We used practically the same specifications for the year 1914 and had no difficulty in getting bids, and we got the coal as well.

"However, since that time my representative has been coöperating with the Bureau of Standards with a view to making the specifications more equitable. The remission clause, in my judgment, is a very good thing, and many of the large coal dealers have so expressed themselves."

Canada's Coal Production

Sales, shipments, colliery and other mine-consumption and coking production of coal in Canada for 1914, says *Commerce Reports*, amounted to 13,594,984 short tons, valued at $33,433,108, compared with 15,012,178 tons, valued at $37,334,940 in 1913, a decrease of 1,417,194 tons, or 9.4 per cent., in quantity and of $3,901,832, or 10.4 per cent., in value.

Arbitrary values are assigned to coals of Nova Scotia and of British Columbia. These are rated as $2.50 per long ton for Nova Scotia and $3.50 per long ton for British Columbia. In the other provinces prices are those returned by the operators. Distribution of production is as follows:

Locations of Mines	Tons	Decrease	Value
Nova Scotia	7,338,790	641,283	$16,381,228
Alberta	3,667,816	346,939	9,367,602
British Columbia	2,238,339	476,081	6,994,810
Saskatchewan	232,541	19,644*	375,438
New Brunswick	104,055	33,744*	260,270
Yukon	13,443	6,279	53,760

*Increase.

Exports of coal in 1914 amounted to 1,423,126 tons, of a value of $3,880,175, compared with 1,562,020 tons, of a value of $3,961,351 in 1913, a falling off of 138,894 tons, or 8.89 per cent.

Imports during the year included bituminous, lump and run-of-mine, 7,776,415 tons, valued at $14,954,321, an average of $1.92 a ton; bituminous slack, 2,509,632 tons, valued at $3,605,253, an average of $1.43 per ton, and anthracites, 4,435,010 tons, valued at $21,241,924, an average of $4.79 per ton. This gives a total of 14,721,057 tons, valued at $39,801,498. Figures for these classes in 1913 were: Bituminous, etc., 10,743,473 tons, $21,756,658; bituminous slack, 2,816,423 tons, $4,157,622; anthracite, 4,642,057 tons, $22,034,839; total, 18,201,953 tons, $47,949,119. Of the 1914 consumption 45.4 per cent. was from Canadian mines.

The Labor Situation

SYNOPSIS—There are expectations that the Hocking Valley operators will secure a new and lower wage scale. Tom Lewis becomes a secretary for coal operators in West Virginia. Colorado mine workers accuse the governor, attorney-general, national guard and three company presidents of murder. In return those charged suspect that the union officials are guilty of subornation of perjury.

The executive committee of the Ohio branch of the Mine Workers of America held an important session at Columbus last week to discuss plans for securing work for miners in the Hocking Valley district. The demand of the Sunday Creek Co. that equal concessions in the dead-work scale should be given the operators in the Hocking Valley as were conceded in eastern Ohio was not discussed and the officials of the Ohio organization emphatically denied that any change would be made in the working conditions. It is claimed by John H. Winder, general manager of the Sunday Creek Co., that the concessions granted operators in eastern Ohio really mean a reduction of 5 to 15c. per ton on the cost of producing coal.

It was reported in mining circles last week that the miners were thinking of calling on their officials to grant concessions which would permit of the Hocking Valley mines being placed in operation. The business men and shopkeepers of mining towns are said to have been urging this move.

Destitution in Mining Regions of Ohio

In the meantime relief work progresses among the destitute miners and their families in the Hocking Valley. This relief is distributed through the office of the adjutant-general of Ohio. J. W. Wheatley and George A. Shust, miners of the Hocking Valley district, are touring the state and soliciting subscriptions for the relief of destitute families in the coal fields. They have secured substantial contributions of money, clothing and food in the cities visited. Both men have worked in the Hocking Valley district for more than 25 years, tilling small farms when the mines were idle.

The "Five-A Studios," a local moving-picture concern, has just finished the production of a drama called "Silent Valley," based on the troubles in the Hocking Valley field, and partly staged in the mining district with the aid of the miners and their families. The production has the approval of state authorities, and will be shown throughout Ohio to secure funds for the benefit of those in distress in the district.

Freight Rates and Wages in Hocking Valley

The books and records of the Hocking Valley Ry. are being examined by experts under the direction of the Ohio Utilities Commission. The railway company has as yet made no move to secure an injunction to prevent the examination of the books, and it is likely that none will be filed at this late date. The experts say that the data will be in shape for presentation to the commission when the hearing on the rate question is resumed, Oct. 5.

On a recent visit of John H. Wilder to Assistant Adjutant-General E. S. Bryant the former stated that not until there has been an adjustment of mining conditions will the Sunday Creek Co. be able to open its mines. The governor's office has been petitioned to act to assure the reopening of the mines in the Hocking district. The claim was made that the recent 15-per cent. reduction in freight rates by the Hocking Valley Ry. would enable the mines to reopen. It appears, however, that only 5 per cent. of the tonnage of the Sunday Creek Co. is shipped over the Hocking Valley Ry., while the remainder is transported by the Toledo & Ohio Central, which has yet made no move toward reducing its freight rates.

Tom Lewis Becomes Secretary for Operators

Through the influence of Quinn Morton, president of the Imperial Coal Sales Co., and Edward Schoenebaum, of the Marmet-Halm Coal Co., members of the executive committee of the recently organized High Volatile Coal Operators' Association of West Virginia, Thomas L. Lewis, of Bridgeport, Ohio, has been made executive secretary of the association.

This selection caused much surprise, for Lewis was at one time president of the United Mine Workers of America. However, there is general confidence in his ability and honesty, and the operators are well satisfied with his selection. The name of the association has been changed to the Splint and Gas Coal Operators' Association of West Virginia.

It appears that for several months the officers of the labor organization have maintained in Colorado a staff of nearly 40 private detectives who have endeavored to obtain evidence against the mine operators. As a result of their work it is said that charges of murder will be made against the governor and attorney-general of the state, the officers of the state national guard and Presidents Jesse E. Welborn, of the Colorado Fuel & Iron Co.; David W. Brown, of the Rocky Mountain Fuel Co., and John C. Osgood, of the Victor-American Fuel Co.

Union Detective Asked to Perjure Himself

On Aug. 28 the governor appointed a military court of inquiry, which was conducted by Colonel Boughton according to regular army rules. It secured sworn testimony from various persons involved in the accusations of the union leaders. It appeared that former Adjutant-General C. D. Elliott, of West Virginia, a union detective, had been instructed that it would not be necessary for him to substantiate charges he might bring against the operators or state officials, as he was expected to use such accusations only in attempts to induce the dropping of prosecutions now pending against mine workers and union leaders.

Written evidence in the form of letters that passed between these detectives and their employers was introduced to show that these agitators were responsible for the demoralization of the state militia. The coal-company presidents accused state that they are prepared to refute all charges and to prove that their persecutors are conducting this attack purely in retaliation for the conviction of John R. Lawson and the indictment of numerous other labor leaders in Colorado.

Michigan Increases Production

Michigan is not a big coal-producing state, yet the U. S. Geological Survey reports that unlike most coal producers it increased its output in 1914 over that of the previous year, the production being 1,283,030 short tons, valued at $2,559,786, an increase over 1913 of 51,344 tons in quantity and $104,559 in value.

Michigan's coal production has exceeded 2,000,000 tons in one year only, 1907; since then it decreased steadily until 1912, when it reached the minimum for the decade. The decrease is attributed to the competition of higher-grade coals from West Virginia and to the small demand for lump coal in the manufacturing plants of the state.

The mines were free from labor troubles, and no time was lost because of strikes. The coal-mining fatalities, as reported by the Bureau of Mines, consisted of one death from fall of roof and one from an accident in connection with mining machinery, a total of two, as compared with three in 1913 and eight in 1912.

Lamp Declared Permissible

On Aug. 21, 1915, the Bureau of Mines approved as permissible for use in gaseous mines the steel, flame safety lamp known as Koehler Model No. 1, manufactured by the Koehler Manufacturing Co., Marlboro, Mass. Approval No. 201 has been issued to the Mine Safety Appliances Co., 541 Fourth Ave., Pittsburgh, Penn., general agent for the lamp.

At present this approval extends to this type of lamp only when equipped with a flat wick and permanent horseshoe-magnet lock. The only globes so far approved for use with these lamps are those identified by the symbol "Macbeth High-Speed No. 210," manufactured by the Macbeth-Evans Glass Co., Pittsburgh, Penn. The only igniter so far approved for use with these lamps is the Koehler Model 1915 Pyro Igniter, manufactured by the Koehler Manufacturing Co., Marlboro, Mass. This lamp is the first to be approved by the Bureau of Mines according to the provisions of Schedule 7.

Editorials

Has Union Activity Helped Labor as a Whole?

A separate report was made to the Commission on Industrial Relations by the three labor leaders in that body, defending the purpose of unions and lauding their work. They evidently recognized that there were still many people who questioned the value of labor organizations to working men, and it must be admitted that there are reasons for the uncertainty which still prevails as to the value of solidarity as a means of raising the welfare of workingmen as a whole.

We are told that unionism has raised wages, but it is a fact that in the memory of men still living ablebodied men worked for 50c. a day at employment which was then, and is still, ununionized. The same work now pays $1.50 to $2 per day. Many men in 1890 worked for 10 hours and received only a dollar. Their services could not be secured for that today; yet these same men are still without a union. It is hard to show that any combination was the cause of the 200 or 300 per cent. increase in wage which has taken place since the middle of the last century.

Of course, it will be said that these men partook in the general rise secured by unionism. It is as useless perhaps to deny it as to attempt to prove it. The influence of example in the rise of nominal wages is so intangible that it is hard to evaluate.

But such gains as have just been discussed are really largely nominal, not actual, for the only real gain of the workers, outside of that arising from efficiency, is obtained by reducing the profit of the employers. If every dollar every employer received were handed on to his workers the wage would be the highest possible. Any higher wage would be merely reflected in higher cost of living and would be merely a nominal, not an actual, increase.

Consequently the proportion of the selling price which the worker receives is the norm on which his wage should be determined. It is absurd to figure it in money values except for purposes of comparison between workers. It is its fluctuation with the selling price of products which is important.

In general it is doubtful whether in recent years this ratio has increased much in many trades. Even the unions do not assert that it has. In some industries, it is true, it has reached a maximum. In the coal trade it has almost always been high except in newly opened coal fields or for brief periods of time. And in this case the union actually admits that the ratio is too high in some states—that is, the price of coal is so low that the operators cannot continue in business and pay their men the wages which the union believes they should be paid and which are provided in covenants with the union.

But as the receipts of the employer in excess of what he pays the worker should be almost wholly and are mainly expended as the capital by which business is made efficient, and without which the business of the company would come to an end, it is questionable whether the union helps the working man when it reduces the employer's profits, for it reduces his opportunity to be efficient. Some mines have suffered so much from enforced economies that they are now no longer economically run, and the miner may get all or nearly all the gross income and yet would be better paid if with better equipment he received a somewhat smaller percentage of the gross value of the output.

It is by no means certainly proven that the greater prosperity working men now enjoy is due to union activity. It is more probable that it arises from increased intelligence of employer and employee and from improved machinery. The union has concentrated its efforts on distribution. Someday we may realize that there cannot be a 100-per cent. division for the worker. We may learn that some part of the product must be kept back either as savings by the workman or as profits by the employer, whether that employer be an individual or the state.

But be that as it may, steadiness of work is an essential of prosperity, and it is not certain that the union has made the conduct of industry more regular. In fact, there are many who think that the union by its strikes, by its creation of inequalities of wage, whereby the industry in whole states is made impossible, and by the unrest it has occasioned, has caused much of the present idleness and dislocation of business from which the country suffers. Possibly this is partly true, though restrictive legislation alternated with unequally and unduly helpful enactments, such as tariffs, both fitfully applied, are at least as much to blame as union activity.

The unrest is not wholly in labor. Business is also in a turmoil and the unrest of one has completed the unsettlement of the other, for men in idle industries become impoverished and consequently discontented, and conversely companies with men on strike cannot pay the bills they have incurred or interest on their bonds and they become bankrupt. Thus the turmoil of business causes industrial unrest and the active protests of the men ruin what business is being conducted.

Some unions have succeeded in securing wages for their members above the average, in other trades or in the same trade in other fields, and this is the stock argument of the advocate of unionism. He points out that only the continuance of the union assures the payment of such larger wages despite the protests of the jobbers and the manufacturers. But it must be remembered that these wages are maintained at the cost of the consumer and therefore are burdens on other workers.

By the use of certain muscles a man can raise his arm. Strive as he will he cannot lift his whole body by hauling on his shoulder straps. Unions like muscles can lift a part of labor by agitation, but they cannot raise the whole body of labor by such methods. Raising the wage of the miner, for instance, inevitably increases the cost of living to all who have to buy a bucket of coal.

A well-organized industry with international power, manufacturing any commodity, could fix wages at any high level and make other men pay them if they could restrain strikebreakers. Some industry may yet succeed in raising wages to an unheard-of level, and with the trusts they may succeed in convincing the world that both unions and trusts must be controlled. Such control may seem so socialistic that the whole body of socialism will be accepted as the most satisfactory outcome.

The strike of the miners in Great Britain may have such an effect, even though not international. The British people will pay anything for coal which operators may demand. The operators can then pay any price to the miners. What remains if both or either are unreasonable? Legislative restriction. The miners resent this, though the operators have already consented to it. If the miners persist probably socialism will be inevitable. But there is nothing to show that the miners will be benefited by the change.

On the New York Post Office runs the proud motto, "Neither snow, nor rain, nor heat, nor gloom of night"—no, nor even children slain by motor cars on the streets—"stays these couriers from the swift completion of their appointed rounds."

Let the miners read it and remember that it is no idle boast, for the rules which back it are most stringent. A private concern could not brag so openly of the extremities through which, under bond, it forces its employees to comply with its contract.

* * *

Significance of Labor Day

Labor Day is the heaven-sent opportunity for the district attorney and candidates for office to make speeches about the dignity of labor in which they only half believe. They try to edge themselves in as laborers by referring to the fact that there is both body and brain toil. Their platitudinous utterances are little heeded and soon forgotten. The district attorney goes home, does as little muscle work as he can avoid and firmly decides that his children shall not do more.

In fact, he talks somewhat disconsolately and socialistically, bewailing that the trusts have cornered all opportunities and gives his children no chance. He knows that they have an opportunity to work at that muscle labor which he has just been praising, and which in his heart he condemns, but he has decided that for them a certain lucrative brain labor should be provided; and as he is doubtful of their ability he begins to rail that "every door is barr'd with gold and opens but to golden keys."

There is a great race, every member of which is a brain worker. It has produced and is producing despite handicaps many distinguished men. Yet it has not for ages been a nation. For the most part the people of the race do not want an independent national existence, for they know they lack muscle workers. Where the race has had a chance to get to the soil, it has failed. The muscle workers were lacking, and being for the most part shrewd, the people of the race have recognized the difficulty and respected their limitations. Most of them are opposed now definitely to any attempt at national existence which would to all appearances be futile and might be ridiculous.

The importance of the muscle worker is thus made apparent. Those who regret bitterly that the brain workers—"the better class," as they term it—do not multiply and replenish the earth might take this example to heart. Abraham Lincoln said, "God loves the common people or he would not have made so many of them." And perhaps Lincoln, though he did not allege it, realized how fully this thesis could be applied to the increase in the race.

It is perhaps well that it is the muscle workers who are doing the mosaical replenishment and not those brain workers who feel themselves so desirable. We may well rejoice that the former are so common. It would go ill with us if they were not. Are the sons of rich men such desirable people and will there not always be enough abnormal descendants of muscle workers to furnish us with the instructors and leaders of the race?

The muscle workers are for the most part inarticulate or imprecatory. In either case they do not command an audience, but their importance as the backbone of the nation is unquestioned. If their forensic eloquence was as marked as their muscle they would have had us all as much converted to the importance of their services as we are already convinced as to the value of brain work and human leadership.

* * *

Some "Bull" Features in Middle Western Market

Close observers believe that several factors are developing in the Western trade situation which will occasion price advances for free coal before the season progresses much further. One of these is the comparatively large number of mines which have been closed down in Western states during the past dull summer and abandoned permanently. No new operations have been opened to take their place, and the withdrawal of this tonnage from the coal marts must create an additional demand on other producers. The delayed ordering of coal is another factor in the situation; and the late harvesting of grain, which is likely to result in the movement of crops simultaneously with increased shipments of coal, will probably cause a congestion of equipment and car shortage. Finally, there is a lack of men in many mining districts, due to the return of foreign miners to Europe and to a decline in immigration.

* * *

Vich Iss der Cheepest?

The coal industry has its quota of buyers—usually those termed purchasing agents—whose sole standard is price.

How wide they often are of the mark of economic buying, and how far astray this standard sometimes leads, is aptly illustrated in this story.

A Hebrew approached the ticket window of the railway station in one of our large cities and said, "I vant a ticket please to Springfielt."

The agent hesitated a moment and then inquired impatiently. "Well, Springfield what? Springfield, Ohio; Springfield, Massachusetts; Springfield, Illinois; Springfield, Missouri—which Springfield do you want to go to?"

The Hebrew, coming closer to the window and holding his greasy purse a little tighter, replied, "Vich iss der cheepest?"

It may be trite to remark, but nevertheless it is true, that "cheapest in price" does not always mean "most satisfactory in service."

Sociological Department

Field Meet of the Utah Fuel Co.

SYNOPSIS—The meet of the Utah Fuel Co. does not bring together many teams, but it is most conscientiously undertaken, so as to be of the utmost value to the participants and to foster the work among the employees generally.

The annual first-aid and mine-rescue contest of the Utah Fuel Co. was held at Castle Gate, Utah, Aug. 21, 1915. As usual, this field day partook of the nature of an annual picnic or reunion, and social features were combined with the contest. Special trains were run from the Pleasant Valley and Sunnyside districts and brought several hundred people to witness or participate in the events. The uniformed bands from Clear Creek and Sunnyside helped the Castle Gate band to enliven the occasion. As each train arrived it was announced by the explosion of bombs, the visitors being met at the station by the reception committee and the Castle Gate band, which escorted them to the public square in the center of the town where the contests were to be held.

The meet this year was of particular interest and importance to everybody, especially the contestants, for in addition to the usual prizes given each year the company undertook to send the team which made the highest combined score in first-aid and mine-rescue work to the Panama-Pacific International Exposition at San Francisco to compete in the Third Annual Joint Field Meet of the Bureau of Mines and the American Mine Safety Association on Sept. 23 and 24.

WINNERS OF FIRST AND SECOND PRIZES AT MEET OF UTAH FUEL CO.

On the left the cup holders, Sunnyside No. 2 team, and on the right No. 1 team from Winter Quarters

ELIMINATION CONTESTS HELD AT EACH MINE

In order to aid in the selection of the best team, elimination contests were held at all Utah Fuel Co. camps on July 24, in which one team was selected to represent each mine in the main contest held at Castle Gate Aug. 21. In this way six teams were chosen which were supposed to be the pick of the mines, and they were given about a month of special training in preparation for the main event. An outside expert in mine-rescue work was employed for two months in thoroughly drilling the men in helmet work and thus supplementing the valuable instruction of the United States Bureau of Mines, which, on account of exhaustion of appropriations, had to discontinue the rescue-car training in Utah some time ago.

The team from Somerset, Colo., was entertained by the Castle Gate Welfare Association, while the other teams and visitors were provided with accommodations and refreshments by the company. Rest pavilions were erected at convenient places for the benefit of visiting women and children.

In the afternoon a ball game was played by the Sunnyside and Castle Gate teams at Riverside Park, the scene of last year's first-aid contest, and was won by the Castle Gate team by a score of 8 to 6. After the ball game the Castle Gate band gave a concert in the public square, which was largely attended. An enjoyable dance concluded the festivities.

Preparations for the meet were put in the hands of committees selected from the Castle Gate Welfare Association, the success of whose work was well attested by perfect accommodations and the smoothness with which everything was accomplished.

The contests, in both first-aid and mine-rescue work, were conducted strictly under the rules adopted for the joint field meet at San Francisco, and with the exception of the problem in rescue work, all the problems were selected from practice problems suggested by the Bureau of Mines and the American Mine Safety Association.

ELABORATE PROVISIONS FOR RESCUE EVENT

The grounds were laid off close to the Knights of Pythias Hall, in the basement of which was built an imitation of a mine for the mine-rescue contests. A plan of the workings is shown. The problem illustrated proved to be one of great difficulty. The teams had to go down the 30-per cent. incline to the entrance, which was a narrow doorway with a brattice hung over the opening to exclude outside light, then along the supposed entry made of posts, boards and brattice cloth about 4 ft. high. Opposite the room neck a small fire was supposed to have started, which had caused quite a fall of rock in the entry outby. The timbers had broken and were hanging, pointed toward the center of the entry from the posts, making an opening about 4 ft. square, through which the rescuers must pass. Trolley wire and power lines were hanging loose, but not touching. Two men who had to be rescued were supposed to have been working in a room which had no crosscuts off the entry inby the fire. These men had found that owing to the poisonous atmosphere they were prevented from making their escape and so had built a barricade in the room neck about 15 ft. from the entry.

So as to give an equal chance to all, all the four contesting teams were given the same rescue problem. This was read to them separately after they had finished the test-of-apparatus drill, and the men were enjoined not to disclose it to the teams following them. Naturally, they did not care to give any undue advantage to their competitors, so they kept the problem secret.

CARE TO AVOID INEQUITABLE JUDGING

The judges for all events were J. C. Roberts, mining engineer, United States Bureau of Mines, Denver, Colo.; J. E. Pettit, state coal-mine inspector for Utah, and H. H. Sanderson, of Salt Lake City, agent for the Draeger Oxygen Apparatus Co. As there were four field events in first aid, the judges could not be assigned to different teams each time, but each judge had to inspect the work of one team for two events. Thus it was that the teams had the same judges in the one-man and full-team contests. In the mine-rescue contest, H. H. Sanderson judged the inspection-of-apparatus work, while the two other judges, Roberts and Pettit, took the work underground. The men's pulses were examined by physicians of neighboring towns.

In the first-aid work six teams competed, one from Somerset in Colorado and the others from Clear Creek, Utah Mine, Winter Quarters, Castle Gate and Sunnyside in Utah, but in the rescue work two of these teams—those from Somerset and Utah Mine—did not compete.

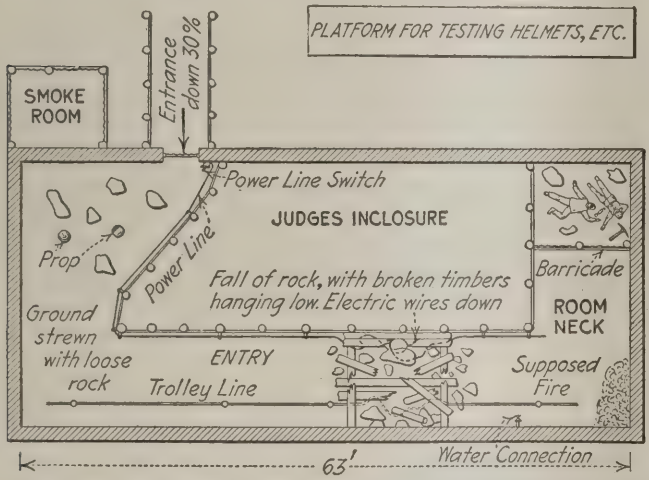
The judges met the evening preceding the meet and decided which problems should be presented. They also discussed the rules by which the events were to be judged. The greatest care was taken to make everything uniform and strictly impartial, and it is believed that absolute satisfaction was given by the decisions. The company feels very grateful to the previously mentioned officials for the services rendered, as their work was hard and unenviable.

PROBLEMS AND THEIR SUCCESSFUL SOLVERS

The problems were as follows:

One Man Event—A man has been overcome by gas in a place so low that he cannot be carried in an upright position. Transport him 20 ft. to a place where the bearer can stand upright and carry him 20 ft. further by the "shoulder carry." Perform artificial respiration by the Schaefer method for one minute. Time, 8 min. Winter Quarters No. 1 and Clear Creek No. 1 tied for first place in this event, both obtaining a perfect score. The second highest score was 96.

Two-Man Event—A man is found lying face up, with his shoulders resting on an electric wire. He is unconscious and his shoulders are burned. Rescue and give him treatment. Time, 8 min. Castle Gate No. 2 and Sunnyside No. 2 both made perfect scores, thus securing first place. Their nearest competitor scored 98.



PLAN OF AN ARTIFICIAL MINE IN WHICH ACTUAL DIFFICULTIES IN MINE RESCUE WERE DUPLICATED

Three-Man Event—A victim has a puncture wound of the palm of the right hand, with bright red blood, a small cut on the calf of the left leg, with slight bleeding, and his left ankle is sprained. Treat the case. Time, 8 min. The best score was made by Utah No. 1 team, which was in no way demerited. The second highest score was 98.

Full-Team Event—The victim has a compound fracture of the left thigh, a wound 3 in. long on the calf of the right leg and a cut on the outer surface of the right forearm, with profuse bleeding. Treat and carry the patient 25 yd. on an improvised stretcher. Winter Quarters No. 1 made a perfect score. None of the other competitors exceeded 97.

The team making the highest average score in all the events was Sunnyside No. 2. It secured a mark of 97.50. The team comprises the following members: M. H. Detweiler, captain; Zeph Thomas, T. J. Johnson, George Clark, J. W Littlejohn and George Usher.

Winter Quarters No. 1 made an average score of 97.25 and secured second place. The team comprises the following members: T. C. Harvey, captain; John Thorpe, James Hall, Horace Simpson, Stanley Harvey and Noah Potter.

Mine-Rescue Event—Smoke is discovered issuing from the mouth of the mine. The crew enters, encounters a bad cave and discovers a fire in the mouth of a room. Men have barricaded themselves against the fire, but have been overcome. Rescue them, working on the fire for one minute. The canary is overcome. Time, 12 min. This event was won by Sunnyside No. 2 Team, with Castle Gate No. 2 a close second.

SUNNYSIDE NO. 2 WINS TRIP TO SAN FRANCISCO

The team making the highest combined score in first-aid and mine-rescue work was Sunnyside No. 2, comprised as above. The average score for all events of the winning team was 91.25.

By winning both events, the Sunnyside team obtained possession of the silver loving cup for one year and a gold medal for each man, all given by the Utah Fuel Co., and in addition will be sent, at the company's expense, to the Panama-Pacific International Exposition in San Francisco, there to compete with teams from all over the country.

A RESCUE CREW BEING INSPECTED BEFORE ENTERING MINE

The members of the Winter Quarters team, for obtaining the second best score in first-aid work, were presented by the company with silver medals.

The work of all the teams was good and there was little to choose between them, there being only 2.5 points of difference between the lowest and highest scores. The scores for all would have been higher but for the fact that not enough time was allowed for the completion of the problem in rescue work. Obviously, it would not have been right to set a new time limit, so all teams were penalized alike.

The work of the first-aid and welfare societies throughout the camps has been of a high-class order, and much good has been accomplished. These societies have been formed by the miners and others residing in the various towns for the purpose of furthering the cause of welfare and first-aid work, and it is due to the voluntary and enthusiastic support of the men that such success has been attained.

For the winning team—Sunnyside No. 2—now commences a period of hard work in preparation for the California trip. It will have the support of the whole company in its efforts to "bring back the bacon" for Utah.

Model Anthracite Village

A model coal-mining village, which includes houses of steel and hollow-tile construction for the mining superintendent, foremen, assistants and miners, has been planned and laid out for the Locust Mountain Coal and Iron Co. The plant will operate the mining property of the Winton-Dodson Co., of which T. M. Dodson is vice-president and general manager.

The success of this model village will be watched with interest by all mining men of the region, for it is based on ideals of which many men are skeptical. There will be six four-family structures for miners, and each will have a living room, kitchen and bathroom on the first floor and three bed-rooms, with ample closet room, on the second floor. There will be front and rear porches, hot and cold water, electric lights in each house and furnace heat.

The superintendent's home will be placed between the houses for the mine foremen, and there will be a double house on each side for the foremen's assistants. A general store, garage and workshop will be built of the same steel and hollow-tile construction.

One of the big features of the plan will be a park for the miners' families, tennis courts, a baseball diamond, a swimming pool and an athletic field. There will be terraced lawns, hedges and bushes, which will give a landscape treatment to the village, an advantage which other mining towns do not possess. It is the intention of Mr. Dodson to have much care taken of the property, and a groundkeeper will be employed.

Mr. Dodson is a firm believer in giving the best possible surroundings and conditions to his employees and feels assured that when this is done a better class of men and better service may be expected. The work will be in charge of George S. Welsh, an architect, from Wilkes-Barre, Penn., who expects to have the plans completed by about Jan. 1, 1916. The coal operation has been recently started and a breaker, which is one of the finest in the region, has just been erected.

Gardens in Concrete City

At Concrete City the Delaware, Lackawanna and Western R.R. coal department gives rewards every year for the best-kept lawns and gardens. As shown in these four illustrations, the homes are better tended than many residences of the wealthy.

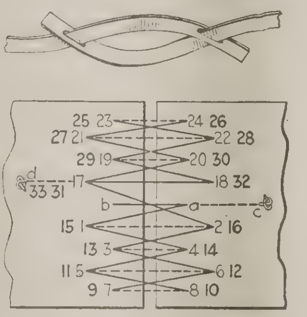
Discussion by Readers

Mining Machinery--Belting

Letter No. 3—I have used a somewhat similar method of lacing belts to that described by "Chief Electrician," *Coal Age*, Aug. 7, p. 227, but differing from his in two particulars.

First, I prefer to begin the lacing of a belt in the center rather than on the edge; and, second, I do not find it necessary to tie the ends of the lace, further than to make a simple knot, as illustrated in detail in the accompanying figure. By starting and finishing the lacing at the center of the belt, the ends of the lace, if they come loose, do not strike passersby or flap against the guardrails. I have always had some difficulty in keeping the ends of a lace tied unless a large and unsightly knot is made.

Referring to the figure, I have numbered the holes in the belt in the order in which the lacing is passed through them, except the two center holes *a* and *b* and the outer holes *c* and *d*, used for knotting the ends. The general position of the holes is the same as that previously described in Letter No. 1.



LACING A BELT

The method of lacing I prefer is as follows: First, to secure one end of the lacing, it is run through hole *a* from the top and carried underneath to hole *b*; this is repeated by running the lace again through holes *a* and *b*. The end is then carried down through *a* and up through *c*, and a simple knot is tied in the end of the lace on the upper side of the belt, as shown in the figure.

Now, taking the other end of the lace, it is passed down through hole 1, up through 2, down through 3, and up through 4, continuing this order to the side of the belt. The lace is passed twice in succession through the holes at the side of the belt, as indicated by the numbering of the holes. Emerging from hole 10, the lace is carried down through hole 11 and up through 12, this order being continued until it emerges from hole 16, when it is carried across the center, missing holes *a* and *b* and run down through hole 17 and up through 18. The same order is continued across the other side of the belt and back to 31 and 32, and finally passed down through 33 and up through the outer hole *d*, where a knot is tied on the upper side of the belt, in the same manner as before.

By this method the lacing presents only parallel lines on the side of the belt next to the pulley, as indicated by the dotted lines in the figure. The full lines in the figure show the lacing as it appears on the upper side of the belt.

The small detail sketch just above the belt, in the accompanying figure, shows a good method of tying together two ends of the lacing, should this be necessary. I may add that the first line of holes in each end of the belt may be set back a short distance sufficient to permit of the ends of the belt being cut off should the belt be required to be shortened at any time.

George N. Lantz.

New Straitsville, Ohio.

[There is one point in which the order of lacing described by correspondent is open to criticism. Let someone suggest what this is and how the order of lacing could be slightly changed to avoid the difficulty. Also, state what would be the tendency of a belt when laced in the order here described.—Editor.]

*

New York Coal Specifications

The issue of *Coal Age*, July 24, p. 132, contained an interesting account of new coal specifications that are to be adopted shortly by the New York City departments. Almost at the beginning of the article an admission is made that the City pays more per ton for a certain grade of coal and secures a poorer quality than certain individual consumers. If observation has brought such a situation to light, it would be the part of wisdom to learn the cause before attempting a remedy. But the article to which I have referred seems to indicate that the city authorities concluded that the fault lies in the specifications and proceeded to correct them. Just how the city expects to lower the price of its coal by elevating its specification standards is difficult for a novice to comprehend.

It is not intended to criticize the transposition of the buckwheat sizes; information has been ample to have justified such a correction years ago. Neither is it the purpose to analyze the new specifications and assemble their inconsistencies. Reference might be made in passing, however, that the "premium" hook is not well baited. For instance, deductions made for excess moisture will not be remitted, although the major tonnage in a given contract may fall materially below the percentage of moisture permissible. Then again, "the total offsetting tonnage shall never exceed the tonnage deductions on the 1-per cent. basis for ash and B.t.u."

In spite of all issues in detail, interest clings to the fact that the city is not a successful buyer in a field where the most talent seems to be concentrated. It is rarely able to secure widely competitive bidding. Some dealers are suspicious of the mechanism of "specifications" in the hands of officials. A superintendent of one of the city departments once admitted to the writer, in explanation of heavier penalties having been imposed in one borough over other districts, that the dealer holding the contract in that borough did not have the good-will of "the boys" and they took advantage of every condition against him. The undeniable inference is that "the boys" were lenient in favored cases. There has been also much criticism, and not without some justification, against the work of the Central Testing Laboratories upon which the city departments depend for their reports of fuel efficiency. The Department of Education requires the dealer to transport and set up cumbersome portable scales at delivery points. Supervision at the dealer's scales would be quite as efficient and cheaper.

But thoughtful consideration of the specification method of purchasing anthracite coal when such a contract cannot secure support from the source prompts one to ask this question, What would be the effect if all buyers of anthracite coal were to impose conditions similar to those adopted by the City of New York? All the anthracite steam coal available for this market is sometimes barely sufficient for the requirements. If one customer or a selected few are to be given the right of choice, they should expect to pay a premium. But is it moral to give preference to a few, in return for a bonus, and serve the balance of the trade at usual prices with the "left-overs"?

Preventing Mine Explosions

Letter No. 8—I have been much interested in reading the several letters on this subject. In my opinion two main things are necessary in order to reduce the possibility of an explosion occurring in a mine generating gas: First, all mining operations and mine workers should comply with the law in a true sense. Second, mine officials should use sound judgment in respect to every detail of the work, especially the ventilation of the mine in their charge. If these two points are strictly observed, I think it would go far toward eliminating mine explosions.

There are, however, weak points in the bituminous mine law of Pennsylvania (1911), and I will draw attention to some of these which occur to me. Art. 9, sec. 1, of the law requires an air volume of 200 ft. per man per min., and sec. 2 permits 70 men to be employed on a single air split. This makes it necessary to circulate 14,000 cu.ft. of air per min. in a split where the full quota of men is employed. The law is deficient, however, in that it makes no mention whatever of the area ventilated by this split.

Suppose, for example, the split ventilates three butt headings. The air volume required by law (14,000 cu.ft. per min.) is ample when these headings are being driven up and rooms are turned. As the rooms are finished, however, and the work of drawing back the pillars is started, conditions change. Heavy falls of roof occur, and more gas is generated, often suddenly. The air current becomes more charged with gas and may reach the danger point at any time, but the worst is yet to come. The number of men employed in this section is soon reduced to, say 30 men. With this number of men the law requires only an air volume of 6000 cu.ft. per min., which is insufficient in most cases for the proper dilution of the gas given off.

Perhaps there is another section adjoining this one, also drawing back the pillars, and it is decided to throw these two sections into one, employing a total of 40 men and ventilating that section with a current of 8,000 cu.ft. per min. In this case the danger is much increased. The air circulating through this larger area becomes heavily charged with gas, and a blownout shot, with a slight quantity of coal dust thrown into the air, is enough to cause a mine explosion.

Here is where the sound judgment of mine officials must be exercised. The requirements of the law are insufficient for the practical needs in the mine. I recall one case where from 23 to 30 men were working in a certain section generating gas. The law required a current of only 6000 cu.ft. per min. in this section. Instead of that, however, there was an air current of from 18,000 to 26,000 cu.ft. per min. circulated in this split, so as to keep the place safe for work. This air current was circulated around some worked-out and abandoned places, containing old gobs. The instance I have cited is no exception in this state.

Another dangerous condition arises in the use of open lights on the return airways of pillar workings. This is prohibited in art. 10, sec. 1, of the bituminous law. But often sufficient precaution is not taken to prevent open lights from being carried into such places. The safety lamps required in pillar work frequently become an element of danger when an unexpected fall drives a quantity of gas down on the lights. Too often a safety lamp is regarded as providing the necessary protection against the gas generated in the workings, but the test may prove too severe and the lamp must be carefully guarded.

In the effort to prevent the occurrence of mine explosions, all gobs should be ventilated directly into the return airway. No open lights should be permitted to enter the return of any section where roof falls are frequent. No electric pumps or wires should be allowed in the return of pillar work. Wherever possible, doors should be avoided, as a door is a very uncertain thing in the ventilation of a mine. Whenever a small air current is passing through an extended section of a mine it should be carefully watched. As a further precaution, permissible powder should be used and all shots should be fired with a battery.

Another practical point that must be considered in guarding against explosions is the complete removal of all the coal, not only to insure the closing of all abandoned places, but in most cases such a removal of coal will be followed by a surface break that permits the free escape of gas from the strata.

Longwall vs. Room-and-Pillar Mining

Letter No. 3—Referring to G. R. Waddell's Letter No. 2, *Coal Age,* July 31, p. 181, I observe he states that he is "a great believer in the longwall method of mining." There are many others besides, who have strong faith in the general application of longwall to the mining of coal, but Mr. Waddell seems to think that this is the one and only method whose advocates can claim that they are following the motto, "Safety the first consideration."

In my experience, I have worked in several mines where it would be absurd to apply the longwall method for the extraction of the coal. Again, I have seen that method tried in a certain mine in Northumberland, where the coal seam lay almost flat and was of a uniform thickness of 4 ft. throughout. The method, however, proved an absolute failure in this seam, which I could show by giving further particulars, if desired. It may be claimed that there was something wrong, as probably there was; but the real trouble is to be found in the local conditions, which did not permit of a successful application of the longwall method.

I want to say that it is practically impossible to state positively that any one method of mining is the best to employ in all cases. We might as well say that a certain method of mine haulage is the best system to employ in a mine or attempt to advise what is the best boiler to use in a power plant. There are always numerous circumstances and conditions that must modify one's decision in a particular case, and this is very true in coal mining. For that reason, the only way to determine the best plan to adopt in a particular mine is to be guided by the conditions on the ground, and even then the development must be carefully watched to observe the success of the method employed.

Mr. Waddell states that he does not think that "there is any record of an explosion occurring in a longwall mine." I want to draw his attention to the following list of fatal mine explosions, all of which were in mines worked by the longwall system:

Sept. 11, 1878, Ebbw Vale colliery, Abercarne..........	268
Jan. 13, 1879, Dinas pit, Rhondda Valley................	63
July 15, 1880, Risca mine, near Newport................	120
Dec. 10, 1880, Penygraig, South Wales..................	101
Dec. 23, 1885, Mardy colliery, Pontypridd...............	81
Feb. 6, 1890, Llanerch colliery, Abersychan.............	176
Mar. 10, 1890, Morfa colliery, Glamorgan...............	87
Aug. 26, 1892, Park Slip colliery.........................	112
May 24, 1901, Universal colliery, Senghenydd...........	81
Mar. 10, 1905, Clydach Vale	33
July 11, 1905, Wattstown colliery........................	119
Oct. 14, 1913, Universal colliery, Senghenydd...........	427

All of the explosions recorded above occurred in mines located in a single coal field, where the longwall method of mining was thoroughly understood. I have worked in mines employing almost every system of mining known, and if asked which of these methods would be the best for general adoption, I would be compelled to say that I could not answer that question without making a careful study of the conditions existing in the mine.

R. J. Brown.

Fernie, B. C., Canada.

Operations in Longwall

Letter No. 1—Referring to the answer to an examination question asking for a description of the operations in advancing a working place in a longwall face, *Coal Age*, Aug. 14, p. 272, I want to suggest one or two points in which my experience of six years as a mine official in longwall work differs from the method outlined in this letter.

After explaining the duty of the miner to examine carefully the condition of the roof and face of the coal and to reset any timbers that may have been displaced by the falling coal during the night and then proceeding to load the fallen coal, the answer goes on to say, "Having loaded all the fallen coal and cleaned up the face, any new timbers required should be set in position."

I would say that a longwall miner must not clean up all his coal before he sets any new timbers. These should be set as soon as there is room for them. They should be set 4 or 5 ft. apart, as the work of cleaning up the coal proceeds. If the miner waits until he has cleaned up all his coal, he is bound to be working under a great area of unprotected roof. Longwall work is subject to sudden breaks, and it is necessary to keep the face well timbered in order to guard against falling roof.

The answer now goes on to say, "The work of undermining the coal should then be commenced, setting the necessary sprags and timbers as this work proceeds." I would suggest that the miner should set sprags along the coal face before commencing to undermine the coal, so as to keep in place any loose coal that may fall. Miners have been slightly injured at times by small pieces of falling coal because they have not set these sprags before starting to undermine the coal.

The answer further states, "Before leaving the place for the night, the miner draws all sprags or other timbers supporting the coal at the face, so as to permit the gradually increasing roof pressure to break down the coal during the night." I want to ask, How is a mine examiner to examine the coal face for breaks or bad top when the coal is not supported? In my experience the miner leaves his place at night well timbered, and his coal if undermined should be well spragged, so that the mine examiner can make a careful inspection of the working face for gas, open breaks in the roof or loose top, with safety. After the miner has examined his place in the morning and set any necessary timbers to make it safe, he should take out his sprags one or two at a time. He should load the coal that falls and set more timber before taking out the other sprags and loading more coal. By so doing he will never be working under a great area of unsupported roof, but his place will always be well timbered.

Assistant Mine Foreman.

Sullivan, Ind.

[We are glad to have correspondent draw attention to his experience and practice in longwall work. Much depends on the toughness and yielding nature of the roof. There should always be maintained a systematic system of timbering in which the posts are set from 4 to 5 ft. apart in rows paralled to the working face. The posts standing in the row next to the face are liable to be dislodged by the falling coal, and these must be reset before any attempt is made to load coal. In loading out the coal from the longwall face it is necessary to keep the space between the first row of timbers and the face of the coal clear, so that the coal can be transported to the head of the road. When working longwall under a frail roof all that the correspondent has said is true and should be observed. The time of drawing the sprags depends on the length of time required to break the coal. This depends again on the nature of the roof, depth of cover, thickness of the seam and hardness of the coal.—Editor.]

Mining Laws and Legislation

Letter No. 10—I have been much interested in the discussion of the responsibility of the assistant mine foreman, and particularly in the case cited by Oliver Young, in letter No. 7, *Coal Age*, Aug. 7, p. 229. The instance given is one in which a miner was killed by a fall of rock or slate after he had been notified to set the timbers required to make the place safe. Failing to obey these instructions promptly, the miner was killed by a fall which took place shortly after the instructions were given.

Mr. Young asks, "Can this assistant foreman be held responsible for the neglect of the miner, after having given him instructions to make his place safe?" and cites the Pennsylvania bituminous law which makes the miner responsible for the safety of his working place and compels him to keep it in a safe condition or to cease work and inform the mine foreman or the assistant foreman of the danger.

In my opinion the responsibility for the safety of a workman rests equally on the workman himself and on the foreman or the assistant foreman in charge of that section. If the miner knew of the bad condition of his working place before being notified or continued to work there after he was notified of such condition, he is responsible for his own neglect or delay in making the place safe.

It seems to me that in this case, however, the assistant foreman was in part to blame for this accident because he did not remain long enough to see that the miner started to obey his orders and set the necessary timber. Instead of walking away after giving this order, he should have satisfied himself that the work would be done or he should have brought the man out and fenced the place off and prosecuted him for his neglect to obey promptly the order given. Had he done this, the miner would have been alive today.

I would ask, What are the duties of the assistant mine foreman in charge of a section of a mine? Evidently he is placed in charge of that section for the purpose of making it safe for work. He is supposed to visit all working places in his charge once or twice a day. In case he finds a place that is dangerous and cannot be made safe at once, it is his duty to withdraw the men working in that place and fence it off until it can be made safe for work. The assistant foreman's motto at all times should be, "Safety First." If an assistant foreman finds his section is too large for him to give proper attention to each working place therein, he should appeal to the boss for help.

Like Oliver Young, I am a firm believer in a uniform system of timbering, but am sorry to say that too many miners are opposed to this plan, preferring to set timbers where they think they are needed, and too often they do not discover the need until too late. Many times I have had to fence off places owing to bad timbering. In most cases miners when left to themselves will not set timbers until the place actually becomes dangerous. My motto is, "If a place is safe, keep it safe by systematic timbering, and don't wait until the roof becomes dangerous before setting timbers." If this rule was followed, there would be fewer accidents from falls of roof and slate.

JACOB RILEY.

Sullivan, Ind.

Study Course in Coal Mining

By J. T. BEARD

The Coal Age Pocket Book

PRACTICAL PROBLEMS

Example—A current of 25,000 cu.ft. per min is passing in a shaft mine. The shafts are 8x12 ft. in section and 250 ft. deep. The airways are 6x10 ft. and 15,000 ft. long, including the return. (a) What is the water gage due to this circulation? (b) Assuming the power applied to the fan shaft remains unchanged and the current is divided into two equal splits, at a point 3000 ft. inby from the foot of the shaft, what volume of air may be expected to be passing; and (c) what will be the water-gage reading on the fan drift and at the bottom of the shaft, after splitting?

Solution—The rubbing surface and sectional area of the shafts and airways are, respectively, as follows:

		Sq.Ft.
Shafts—		
Rubbing surface	2(8 + 12)2 × 250 =	20,000
Sectional area	8 × 12 =	96
Airways (total)—		
Rubbing surface	2(6 + 10)15,000 =	480,000
Sectional area	6 × 10 =	60
Main airway—		
Rubbing surface	2(6 + 10)3,000 =	96,000
Sectional area	6 × 10 =	60
Two equal splits—		
Rubbing surface	2(6 + 10)12,000 =	384,000
Sectional area	2(6 × 10) =	120

The relative part potential factors are then:

Before splitting—

Shafts $\left(\frac{1}{X}, \frac{1}{X_p^2} \text{ or } \frac{1}{X_u^3}\right) = \frac{s}{a^3} = \frac{20,000}{96^3} = 0.0226$

Airways (total) $= \frac{480,000}{60^3} = 2.2223$

General relative mine potential factor $\left(\Sigma \frac{1}{X}\right)$ 2 2449

After splitting—

Shafts (as before) 0.0226

Main airway $\frac{1}{X} = \frac{s}{a^3} = \frac{96,000}{60^3}$ 0.4444

Splits $= \frac{384,000}{120^3}$ 0.2222

General relative mine potential factor $\left(\Sigma \frac{1}{X}\right)$ 0.6892

(a) **Water gage** (before splitting)—

$$w.g. = \frac{1}{5.2}\left(kQ^2 \times \frac{1}{X_p^2}\right) = \frac{0.00000002 \times 25,000^2 \times 2.2449}{5.2} = 5.4 \textit{ in.}$$

(b) For a constant power on the air, the quantity varies as the cube root of the mine potential; but, for a constant power applied to the fan shaft, owing to the efficiency of the fan varying inversely as the 3/5 power of the potential X_u, the quantity varies as the 4/5 power of that potential.

The Coal Age Pocket Book

The mine potentials, in this case, are,

Before splitting— $1/X^3_{u1} = 2.2449$; and $X_{u1} = \frac{1}{\sqrt[3]{2.2449}} = 0.7637$

After splitting— $1/X^3_{u2} = 0.6892$; and $X_{u2} = \frac{1}{\sqrt[3]{0.6892}} = 1.1321$

Then, for a constant power applied to the fan shaft, the quantity of air in circulation varies as the 4/5 power of the power potential, which gives for the circulation after splitting

$$Q_2 = Q_1\left(\frac{X_{u2}}{X_{u1}}\right)^{\frac{4}{5}} = 25,000\left(\frac{1.1321}{0.7637}\right)^{\frac{4}{5}} = 34,250 \textit{ cu.ft. per min.}$$

(c) **Water gage** (after splitting)—In the fan drift the gage is

$$w.g. = \frac{0.00000002 \times 34,250^2 \times 0.6892}{5.2} = 3.1 \textit{ in.}$$

To find the gage at the shaft bottom it is necessary to deduct the potential value for the two shafts from the total poential value for the mine after splitting; thus

$$\frac{1}{X} - \frac{1}{X_o} = 0.6892 - 0.0226 = 0.6666$$

Then, since the gage is proportional to this potential factor, the gage at the bottom of the shaft is

$$w.g. = 3.1 \times \frac{0.6666}{0.6892} = 3.0$$

Relative Variation of Factors—The following relation of some of the more important factors in the ventilation of mines by means of centrifugal fans is based on the results of many experiments:

Power on Air Constant (KU = u)—

Unit pressure, p *varies as* Q^2

p *varies as* $\sqrt{X} = \sqrt{\frac{a^3}{s}} = a\sqrt{\frac{a}{s}}$

Quantity, Q *varies as* $\sqrt[3]{X} = \sqrt[3]{\frac{a^3}{s}} = \frac{a}{\sqrt[3]{s}}$

Power Applied to Fan Shaft Constant (U)—

Efficiency, $1/K^5$ *varies as* $X_u^3 = X_p^2 = X = a^3/s$

K^5 *varies as* n^3

Effective power, u *varies as* K

Quantity, Q^6 *varies as* X_u^4

Speed, $1/n$ *varies as* X_u

Mine Potential Constant ($X = a^3/s$)—

Effective power, u *varies as* Q^3

Quantity, Q^5 *varies as* n^4

Water gage, $(w.g.)^6$ *varies as* n^8

Speed, n *varies as* U, practically

Efficiency, K^5 *varies as* n^7

Inquiries of General Interest

Working Thick Inclined Seams

I wish to inquire how you would mine an 86-ft. seam of bituminous coal having an inclination of 18 deg. with the horizontal.

S. P. Dickinson.

San Francisco, Cal.

Illustrations of such mining are to be found in the St. Etienne coal field of France, where seams of varying thickness and inclination occur. One of these, the Grand Couche, is 82 ft. thick in places and has an inclination varying from 30 to 90 deg. This seam is reached by cross-measure drifts driven from a vertical shaft to strike the seam. When these cross-tunnels reach the middle of the seam horizontal levels are driven to the right and left on the strike of the measures. The seam is then divided into panels by driving inclines about 400 ft. apart, center to center. These are driven up the pitch to strike the level of the lift above. A similar incline is then driven up the center of each panel. These inclines are driven on the full pitch and about in the middle of the seam.

The coal lying in the seam between two consecutive lifts is now divided into, say four or five equal stages, each stage being worked separately in about five substages, the substages having each a height of 6 or 7 ft. for convenience in timbering. The stages are worked in order, from the top of the panel downward, the upper stage being about one-third worked out when the stage next below is started. The substages are worked in order from the bottom of each stage upward, until the coal in that stage is exhausted.

The method of extraction in each stage is as follows: Beginning at the bottom of the upper stage of the panel, crosscuts are driven from the center incline horizontally across the seam. The work of extraction is then begun, simultaneously, at the head of each of these crosscuts, by driving levels to the right and left the entire width of the panel, a distance of nearly 200 ft. As these levels advance, they are followed by other levels in succession, the head of each level being a few yards in advance of the next one outby. This creates a stepped longwall face in each half-panel, which is worked out on the retreating system. The entire coal in this substage is thus taken out back to the middle of the seam, the space being built in with refuse or filling brought from the surface, as the work proceeds.

The work on the next substage above is commenced by driving crosscuts, as before, in both directions from the center incline; but these crosscuts are driven a little to one side of the crosscuts below, so as to rest on the coal not yet taken out and on the refuse in the worked-out portion below. In this manner the substages are worked out successively, the coal being replaced by material brought from the surface or by the refuse of the seam. While at work the miners in each substage above stand on the refuse or building in the substage below. The filling of this refuse must be done in a careful manner. The packwalls must be built as solid as it is possible to make them. In the system here described, the work of extraction is being carried on in three successive stages at the same time.

In the case cited by correspondent and illustrated in the accompanying figure, it may be assumed that the seam outcrops on the property. In that case the mine should be opened by an incline or slope driven in the middle of the seam. The accompanying figure is a diagram and shows but a single main slope driven in the middle of the seam. This is shown in cross-section on the right and in elevation on the left. It is advisable, however, to drive three or four parallel slopes, the center slope or slopes being used for haulage, while those on either side are employed for manways, ventilation and drainage. The same system may be employed as that just described and in use in the French mines.

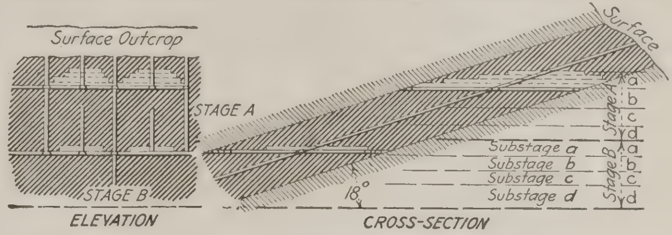

DIAGRAM SHOWING METHOD OF WORKING THICK INCLINED SEAM

In the figure two stages are shown, the upper being stage *A* and the lower stage *B*. Each of these stages is divided into four substages, marked *a, b, c, d*. The development in the upper stage is shown as having progressed further than that in the lower stage.

The seam is first divided into panels by driving the main slopes from the outcrop, about 400 ft. apart. These slopes are driven in the middle of the seam and correspond to the main inclines previously described. The panels are now completed by driving levels or lifts on the strike of the seam, at certain specified distances apart. Inclines are driven up the center of each panel, as indicated in the elevation on the left.

Now, beginning at the bottom of the upper stage in each panel, level crosscuts are driven, as previously described, in both directions from the center incline. The work of extraction is begun at the head of each crosscut by driving levels to the right and left across the entire width of the panel. Other levels follow these, as has been described, the face of each level being a few yards behind the one preceding so as to form a longwall face on the retreating plan.

The success of the method here described depends to a very large extent on the care and thoroughness observed in packing the space previously occupied by the coal. It will seldom occur that the refuse of the seam will be sufficient for this purpose and the necessary material must then be brought from the surface.

Examination Questions

Miscellaneous Questions

(Answered by Request)

Ques.—(a) What dangers arise in dusty mines from the blasting of coal and the lack of judgment in placing holes for blasting the coal? (b) Would you consider it safe to permit blasting to be done in mines generating explosive gas? (c) If so, what percentage of gas would you consider safe, and under what restrictions would you permit blasting?

Ans.—(a) The danger of blasting coal in dusty mines consists chiefly in the dust being thrown into suspension in the air by the force of the blast and the dust cloud thus formed being ignited by the flame of the powder and gases projected from the hole. The ignition of the dust causes a local explosion that may, under favorable conditions, be extended throughout the mine and cause a mine explosion. Bad judgment in the placing of shots or in the amount of powder required to charge the hole may result in a blownout or a windy shot, either of which is always dangerous in a dusty mine.

(b) When blasting coal in a mine generating explosive gas, special precautions must be taken to avoid trouble. Only permissible powders should be used, and all shots should be inspected, charged and fired by competent shotfirers after the men have left the mine. The shotfirers should use moderate charges of powder and tamp the holes with clay. They should start to fire the shots on the return end of a section of the mine and proceed in order against the air, giving time for the explosive gases and dust to be carried away before firing each successive shot. A shotfirer should refuse to fire any hole that in his judgment is unsafe. He should examine each place for gas before firing a shot therein.

(c) It is difficult to say what percentage of gas can be considered as the limit for safe blasting in mines. Much depends on the dusty condition of the mine, the fineness and inflammability of the dust, the kind of powder used, and the precautions taken in charging and firing the shots. In hard-coal mines, blasting is performed safely in 2 per cent. of gas, while in the mining of soft, inflammable coal producing much fine dust, blasting becomes dangerous when the gas falls below 1 per cent.; and it is important then to ascertain that there is no accumulation of gas at the face, before firing a shot. Under these conditions, blasting should only be permitted when all of the precautions mentioned in the last answer are observed.

Ques.—Under what conditions would the use of open lights be safe in gaseous mines, and under what conditions would you forbid the use of open lights in such mines?

Ans.—When it is impossible to prevent the possibility of gas accumulating at the working face or above falls, or in other void places in the mine, locked safety lamps should be used exclusively. Also, in mines where gas is generated in such quantities that there would be danger arising from a possible derangement of the air current for a short time, caused by the setting open of a door or an unexpected fall of roof in an airway, or other unavoidable cause.

Ques.—How would you prove that a potash cartridge is fit for two hours' work?

Ans.—If the cartridge has not been used, it would be necessary to disconnect the seals, shake the cartridge and if the contents were loose and rattled freely, it may be considered as good for two hours' work, but this can only be proved by using it for that time in an apparatus properly charged at 120 atmospheres and giving off 2 liters of oxygen per minute.

Ques.—How would you prove that the oxygen cylinder is charged sufficiently for two hours' work?

Ans.—By opening the main valve and examining the pressure gage. If the cylinder is properly charged, the gage will register 120 atmospheres or more. Then, try to determine by the water gage or meter that 2 liters of oxygen per minute is being released or given off, as 120 atmospheres at 2 liters per min. will last two hours, providing all joints are tight and there is no leakage.

Ques.—What is the last thing you would do before turning on the oxygen supply, supposing you were on the point of entering a danger zone?

Ans.—Examine all connections to determine that they are air-tight; inflate the breathing bag from the outside air: then turn on the oxygen and examine the gage and rest a few minutes until breathing is normal and obey the leader.

Ques.—When would you retire from a dangerous zone if you were one of a rescue party?

Ans.—If my apparatus was working satisfactorily, I would obey the leader, but would consider it time to retire when one-third of my oxygen was used, regardless of time or distance from fresh air.

Ques.—What is the purpose of the emergency valve or bypass and when should it be used?

Ans.—The purpose of the emergency valve or bypass is to enable the wearer to supply the breathing bag with oxygen direct from the cylinder, in case the reducing valve got out of order and failed to supply the necessary amount of oxygen required. It should only be used in cases of emergency.

Ques.—A sinking bucket is 4 ft. 6 in. deep, 3 ft. 3 in. in diameter at the top and 2 ft. 9 in. at the bottom. What is the cubical contents of the bucket, and what weight of water will it hold?

Ans.—The bucket is 54 in. deep, 39 in. across the top and 33 in. at the bottom. It is therefore the frustum of a cone, and its cubical contents is

$$Vol. = 0.7854 \times \frac{54}{3} \times \frac{39^3 - 33^3}{39 - 33} = 55{,}092 + cu.\ in.;$$

or 55,092 ÷ 1728 = 31.88 cu.ft.

Since water weighs 62.5 lb. per cu.ft., the weight of water that the bucket will hold is 31.88 × 62.5 = 1992.5 lb., or say 1 ton.

Coal and Coke News

Harrisburg, Penn.

The Interstate Commerce Commission on Sept. 3, postponed until Dec. 1, the effective date of its order reducing freight rates on anthracite railroads. The order was to go into effect Oct. 1.

In their petition asking for an extension the anthracite roads expressed a general intention to comply with the reduction, but suggested that a complete checking of the proposed tariffs required labor and time. The commission, following its custom in important cases, decided to grant the extension. A thorough checking of the tariffs may lead to further requests for minor modifications, but it was believed here today that for the present there is no prospect of litigation by the railroads to test the order.

It is predicted here that the price of anthracite promises to be as high, or higher, this winter, and those who have postponed buying their coal in the hope of getting cheaper prices for Oct. 1 will be disappointed. The new transportation rates for anthracite entailed a cut of 10 per cent.

Railroad men connected with anthracite carriers expressed great satisfaction with the delay. According to the railroads, there has been a big falling off in earnings on anthracite transportation since the drastic decision was handed down last month. The individual consumers postponed their orders, they said, and thereby caused the retailers and jobbers likewise to curtail orders.

October and November are big months in the anthracite business. It appears now as if the railroads by getting the prevailing old rates for transportation during these two months, will practically not suffer at all this calendar year as the result of the commission's decision.

The railroads, in the order in which they will profit by the postponement of the new transportation rates are the Lehigh Valley, the Reading, the Lackawanna, Delaware & Hudson, Central R.R. of New Jersey, Erie, Pennsylvania and Ontario & Western. The assumption that a cut of 10 per cent. in the transportation rates after Dec. 1 will cause a cut of 10 per cent. in the price of anthracite to the consumer is contested by the railroads. They maintain that the public will have to pay the same prices in any event and that the gain will go wholly to the retailers and jobbers.

August was a third month of low anthracite production, although there was slight improvement over the previous month, and it is probable that the total output for the first 8 months of the year is nearly 2,000,000 tons less that for the first 8 months of last year. This will mean an anthracite shortage at certain points later in the year, as it is impossible to produce, prepare and ship the coal to market as fast as necessary unless the demand is fairly evenly distributed throughout the year.

The official figures of the amount of coal shipped to market by the initial railroads will be sent out this month from Wilkes-Barre by the Anthracite Bureau of Information, which has absorbed the Bureau of Anthracite Statistics hitherto located in Philadelphia.

While the official figures will be announced later in the month, the amount shipped to market will probably fall short of the tonnage in August 1914, which was 5,483,743 tons. From this time on the demand for anthracite should be more brisk, and both dealers and consumers will begin to stock up so as to avoid a shortage later in the season.

PENNSYLVANIA

Anthracite

Hazleton—The colliery machine shops in this region are having difficulty to keep a full complement of employees, as many of the men are being attracted by the high wages offered by plants working on war material.

Wilkes-Barre—Over 200 mine workers, principally natives of the warring European countries took the examination for certificates as miners here on Aug. 29, preferring to work in this country than to fight in Europe. While the applicants appeared eager to pass and obtain the coveted certificates only one-third of them were able to reach the required standard of knowledge that would insure the safety of themselves and fellow employees as practical miners.

Wyoming—Several hundred men and boys employed at the Westmoreland colliery of the Lehigh Valley Coal Co. went out on strike on Aug. 30, following the refusal of several workmen to obtain buttons of the union by either joining the organization or paying back dues.

Pottsville—The mines of the anthracite region still continue to experience great difficulty on account of flooding due to the excessive rainfall of the past summer. In several instances the accumulation of water has been such that the pumps at some of the collieries could not cope with it and as a result numerous shutdowns have resulted. In the vicinity of Shenandoah City the pumps could not begin to keep the water down and as a consequence a number of these machines were submerged. New pumps have been sent in and are being installed as rapidly as possible. Men of long experience in mining state that the continuous high water is the worst in the history of the region, and is costing the operators heavily.

Plymouth—All of the collieries of the Wyoming Valley are operating on nearly full time, the demand for coal being good. Collieries of the Delaware & Hudson Co. have been operated on good time for several weeks past, the Plymouth division producing an unusually large amount of coal. The breaker at No. 5 colliery has been closed for repairs for several weeks, but coal produced at this colliery is being prepared at No. 2 breaker at which double time is the rule. Several hundred mine workers at No. 5 colliery of the same company at Parsons will be thrown out of work until Nov. 1, by the closing of this colliery. Repairs will be made to the breaker and the capacity will be increased so as to care for the coal taken from the Baltimore tunnel. While repairs are being made at Baltimore No. 5, the coal mined at No. 5 will be prepared at the Baltimore Tunnel breaker which will be abandoned after Nov. 1.

Bituminous

Bradenville—The No. 1 mine of the Atlantic Crushed Coke Co., near Bradenville, Westmoreland, Co., Penn., has reopened in full after a long shutdown. The Atlantic company also expects to resume operations at its No. 3 mine. With the opening of these two mines the Atlantic company will have in full operation three plants as the big New Derry plant is operating with as many men as can be had. The Duquesne plant of the Bradenville Coal & Coke Co. at Bradenville is running full. Numerous and extensive improvements are being made at this plant.

Uniontown—Charles Ford, of Jefferson Township, Fayette County, Penn., has sold to the H. C. Frick Coke Co. ten acres of coal underlying his farm for $800 per acre. A large portion of the $8,000 consideration was paid in cash on the consummation of the deal. The property is located near Braznell.

Connellsville—The coke production of the Connellsville region recently rose to 391,000 tons per week, being a gain of approximately 9,000 tons over the previous week. Merchant ovens are now operating up to the average of 1913 which was one of the best years in the coke business.

Charleroi—The Hazel Kirk and Dunkirk mines of the Pittsburgh-Westmoreland Coal Co. at Charleroi recently resumed operations, giving employment to about 400 men.

Altoona—The Pennsylvania R.R. Co. is using every inch of available space in this district for the storing of fuel. Great piles of coal containing thousands of tons are being stored at South Altoona and at the lower end of the yards, and it is believed that the Pennsylvania will continue to store fuel until all available space is filled. Precautions are being taken to pile the coal in such a manner that the danger of spontaneous combustion will be reduced as far as possible. Other large railroads are storing coal but Altoona is the principal storage place in this district for the Pennsylvania system.

WEST VIRGINIA

Clarksburg—The Consolidation Coal Co. recently paid its miners for work done during the first half of August. This pay in the Clarksburg district amounted to $50,000, but was not considered a heavy payroll. Difficulty has been experienced in securing enough cars and boats to take care of the tonnage. This condition has been bettered somewhat, and September tonnage promises to be heavy.

Huntington—The August loading of the Chesapeake & Ohio R.R. totalled 2,420,630 tons, as against 2,232,305 tons in July. It had been anticipated that the August loadings would reach the 2,500,000 ton mark, and the actual loading was a close approximation to this figure. At the present rate of increase, the total tonnage for the current fiscal year will reach approximately 25,000,000 tons. Usually the coal loading falls off after July and August, but this year some operators affirm that the new pace is to be maintained, and that the total for the fiscal year ought to be nearer 30,000,000 tons than 25,000,000 tons.

VIRGINIA

Lynchburg—Trial of 17 ejectment cases instituted in the Federal district court here against 1,200 defendants, by the Virginia-West Virginia Coal Co., of Charleston, W. Va., will begin shortly. The plaintiff is seeking to oust occupants of coal lands to which it claims the title, occupancy dating in some instances as far back as the Civil War. By agreement, two cases will be tried as test cases, and judgment will be entered in the others accordingly.

ALABAMA

Birmingham—A bill has been introduced in the legislature by Mr. Rogers, of Sumter County providing for the working of convicts in the development of the coal mines owned by the University of Alabama, and that an appropriation of $250,000 be made to establish a system of mining the coal lands of the University. The school owns a large quantity of coal lands along both sides of the Warrior River, and the opening of lock 17 gives access to the sea.

KENTUCKY

Louisville—The Harlan Coal Mining Co., of Louisville, has had a successful contest under way whereby dealers are being interested in the choice of a name to be used by the company in connection with its leading domestic coal, mined in Harlan County, Ky. The company offered a car of its coal as the prize for the winning suggestion. A great many dealers submitted names, and the contest will be hard to decide. The company has announced that in order to permit additional names to be submitted, the date for closing has been changed from Sept. 1 to Sept. 15. As the coal market is rising at present, the value of the prize is also ascending, and competition for it is naturally keen.

The Cumberland Telephone and Telegraph Co., with headquarters in Louisville, has begun the construction of an important long distance line from Hazard to Jenkins, Ky. The line will be by way of Cornettsville, Blackey, Whitesburg, Kona, Seco, Fleming and McRoberts. At present the Elkhorn and Boone's Fork coal fields are entirely out of reach of Louisville by phone, and the extension will prove of great value to all those interested in the coal industry.

Hazard—One of the best indications of improved coal business in eastern Kentucky is the fact that a car shortage has made its appearance in that district. Operators on the Louisville & Nashville report that they are having trouble getting sufficient cars, and their neighbors in West Virginia are also experiencing a similar shortage. The mines are running five or six days a week, and the demand is so good that the railroads are having trouble taking care of the business.

OHIO

Coonville—Reports indicate that the mine near here, which is and has been for some time in the hands of a receiver, will shortly be reopened, in order to take advantage of the fall and winter business.

Columbus—One of the features of the Ohio State Fair, recently held at Columbus, was the display of the efficiency of mine rescue apparatus by the Ohio Mining department. Under the direction of Chief Inspector J. M. Roan, a deputy entered a glass cage with two guinea pigs. Equipped with the apparatus the deputy was able to withstand carbonic acid gas while the guinea pigs suffocated.

The New York Coal Co. has filed two suits against the Sunday Creek Coal Co. in the Franklin County courts to collect $13,116 and $20,000 respectively on royalties claimed to be due for coal mined, calculated on the basis of 10c. per ton.

Lost Run—The Essex Coal Co., of Columbus announces that coal will be loaded from the new mine at Lost Run in Hocking County shortly. Another opening is being made within a mile of the Lost Run mine, which will be in operation in 30 days. Each of the new operations will have a capacity of 800 tons daily.

West Wheeling—The West Wheeling Coal Co.'s mine, which has been working only about 25 men, is ready to resume in full with promise of a steady run. When working to capacity, this mine employs about 100 men.

Blairsville—The Graff Bros. are operating all their mines to their full capacity, and it is stated that they could use 300 more miners at the present time. The total capacity of these mines is about 7,000 tons per day.

Athens—Officials of the Pittsburgh Coal Co. recently announced that Mine No. 10 would begin operations shortly. This mine has been idle for nine months, and will employ about 300 men. Other mines around the city, except those of the Sunday Creek Co. are working well.

ILLINOIS

Oliver—The people near Oliver who have given coal leases on their land to the Coal Hill Coal Co. were recently notified that the leases were to be transferred to the St. Marys Coal Co., which would buy the coal rights at once, with the intention of developing the field.

Lenzburg—An involuntary petition in bankruptcy has been filed in the United States District Court at Danville, Ill., against the Tirre Coal & Mining Co. of this place. The petitioners are Mrs. Mollie E. Tirre and F. E. Tirre, both of St. Louis, and William F. Zager, of Lenzburg. Mrs. Tirre alleges that she loaned the company $14,441. F. E. Tirre says the company owes him $1,680 and is unable to meet its obligations. Adam Karr, Theodore Karr and Fred Engelke, of Belleville have obtained in the Circuit Court at that place a distress warrant against the company on the allegation that it is indebted to them $1,727.69 for rents and royalties.

MONTANA

Great Falls—A petition has been filed in the district court by the Brown Coal Co. of Sand Coulee, asking that the court grant an injunction restraining William Pattkovitch and his wife, Mary, from interferring with the plaintiff or its employees. The petition alleges that Pattkovitch and his wife have threatened the lives of the plaintiff's employees for trespassing on the land they are farming. The company claims to have leased the land from the owner, who reserved the surface rights, except to permit the necessary operation of the coal, Pattkovitch and his wife drove the agents of the company from the land.

WASHINGTON

Seattle—At a recent meeting in Seattle of 75 per cent. of the coal producers of the state, the Coal Producers Association was organized. The object of the association is to increase the demand for coal produced by the mines of Washington, actively campaign for the extended use of coal and to promote legislation that will result in restoring the duty on foreign coal brought into this country, or put it on the same basis as that imposed on shipments of coal from this country into foreign countries, to conduct negotiations with various railroads looking to the securing of equitable rates to all points and on all railroads, particularly as compared with freight rates from other states or foreign countries into this state. It is expected that all the small as well as the large coal operators of the state will become active members. The mines of Washington, it is asserted, have not been working more than half time during the past year owing to general depression of business and the introduction of oil during the past few years. The matter of extensive advertising by the association, through magazines, newspapers and billboards of the advantages of the use of local coals and the support of home industries, to offset the heavy advertising of British Columbia coals, was discussed and arrangements made for an assessment of the Washington coal companies to raise a sufficient sum to cover the state with advertising next year.

FOREIGN NEWS

Amsterdam, Holland—It was recently reported that the miners in the Charleroi district and in Hainaut, Belgium, have ceased their strike and returned to work. The demand of the miners for increased wages was granted, the employers steadily refusing the offer of intervention by German soldiers.

PERSONALS

John Harshman, formerly superintendent for the Tower Hill-Connellsville Coke Co., is now superintendent for the W. J. Rainey Co., at Mount Braddock, Penn.

Charles H. Crocker, of Johnstown, Penn., was recently appointed mine inspector by Governor Baumbaugh. He will assume his duties Sept. 18, with headquarters in Blairsville, and will have charge of the new field in district No. 13, including part of Indiana and Westmoreland Counties.

Kenneth Ream, a 12 year old boy from mine No. 38, Seanor, Penn., carried off the individual prize in the Berwind-White employees' first aid contest held recently. Young Ream was entered in the problem contest set by the Du Pont Powder Co. and won over much older and more experienced competitors. The prize was a solid gold scarf pin.

INDUSTRIAL NEWS

Birmingham, Ala.—Wage workers of the bankrupt concern known as the Wadsworth-Cahaba Coal Co., who were preferred creditors recently received 50 per cent. of the money due them. There were 94 such creditors, the amount due being $2,500.

New Orleans, La.—It is stated that the Pratt Consolidated Coal Co. of Birmingham, represented in this city by the New Orleans Coal Co., will before long put into operation a through barge service from the Alabama fields to New Orleans.

Philadelphia, Penn.—A cargo of coal was recently shipped from Philadelphia to Africa, carried by the British steamship "Strathgarry," clearing from this port for Algiers. The cargo was valued at $17,955.20 and was loaded at the Greenwich coal piers.

Hickman, Ky.—After considerable delay due to protests filed by consumers at Hickman, Ky., and other points, the Nashville, Chattanooga & St. Louis R.R. has been permitted to make effective increases in the rate from mines on its road to Hickman from $1.20 to $1.50.

St. Louis, Mo.—Members of the St. Louis Coal Club were the guests recently of the M. W. Warren Coke Co. and inspected the new $2,000,000 by-product coke plant of the company, now in operation at Corondelet, on the Mississippi River, in the southern part of the city. The Warren company's product is becoming a formidable competitor of anthracite. It is handled by most of the St. Louis dealers.

New Orleans, La.—Six 500 ton barges are being built at Slidell, La., by the Salmen Brick & Lumber Co., for Henry DeBardeleben, head of the W. G. Coyle Coal Co. of this city, to transport Sipsey coal from Cordova to Mobile and thence to New Orleans. Other coal companies operating in the New Orleans territory are considering the establishment of barge lines from New Orleans to the coal fields of Alabama.

Great Falls, Mont.—A hearing was held here recently by the Montana Railroad Commission, upon the petition of the Nelson Coal Co. for better rates for their product from Sand Coulee over various lines of the state. The Commission has been petitioned to grant from 30 to 40 days during which time the various parties to the hearing will file their briefs. A decision on the matter will not be forthcoming for several weeks.

Philadelphia, Penn.—The Pennsylvania R.R. Co.'s supply of empty coal cars has been insufficient to meet the demands put upon it for the storage of cars of bituminous coal in desired quantities along its lines. Accordingly great piles of coal are being made at various points between Philadelphia and Harrisburg and on the middle division east of the soft coal region. These heaps of coal far surpass anything of the kind ever seen in Pennsylvania before.

Middlesboro, Ky.—The Louisville & Nashville R.R. has added another through freight crew from Corbin to Norton. This brings the total number of crews up to any previous record. Most of the coal mines in the Middlesboro district are operating five to six days per week, as against an average of less than three days for several months. Mines producing commercial coal have plenty of contracts and some are refusing contracts running over long periods.

Philadelphia, Penn.—The owners in this city have been advised that the coal barge "J. B. Walker," which left here a few days ago with a cargo of anthracite for Portsmouth, N. H., was compelled to put into the Delaware Breakwater on account of bad leaks developing, which together with serious trouble to the pumps endangered the vessel. It is expected that it will be necessary to beach the boat, as it has not been found possible to decrease the amount of water in her hold.

St. Louis, Mo.—The Missouri, Kansas & Texas Ry. Co., with headquarters in this city, has let a contract to Dorset Carter, of Oklahoma City, Okla., for 800 cars of coal a day. Machinery is being installed at Lehigh for stripping the coal. For this purpose one of the largest steam shovels ever made is to be used. Its capacity is 7 cu.yd. The land from which the coal is to be taken is five miles from Lehigh. The strip pit is three and a half miles long. A railroad spur has been built from Lehigh to the field.

Rockport, Ky.—A movement has been started in the western Kentucky coal district to construct a highway from Beaver Dam to Central City, and to call it the duPont Highway, in honor of one of the leading owners of coal mining properties in the district. The managements of the coal companies along the route of the proposed road are much interested in the movement, and a meeting was held at Rockport, Ky., Sept. 4 for the purpose of completing details of the project.

Frankfort, Ky.—The Kentucky Railroad Commission has decided to approve coal rates on the Chesapeake & Ohio R.R. from originating points in eastern Kentucky on a sliding scale basis with five miles as the unit. The road operates over the Ashland Coal & Iron road for 22 miles east of Ashland, Ky., and at this point a wide range of charges has been in effect. The commission was asked to equalize these rates, and instructed the road to file a tariff based on a sliding scale, as was done some time ago in a western Kentucky coal case.

Pittsburgh, Penn.—Coal dealers in western Pennsylvania, believing that the storage of coal by the Pennsylvania and other railroads is significant of the possibility of labor trouble in the mines next spring, are laying up large quantities themselves. All available storage room the wholesalers have is being filled with various grades of coal for the coal men view with uncertainty the attempts that will be made next April to renew the four-year agreement, that then expires between the producers and the United Mine Workers. The large mining companies are storing millions of tons in an effort to be able to meet the increased demand this winter. More coal is being exported from the country than ever before.

Olympia, Wash.—County Assessor Sams, of Thurston County Washington is contemplating a systematic coal survey of the county. This action is the direct result of the board of equalization, failing to reduce the assessment of the Washington Union Coal Co., of Tono which asked a reduction of $56,000. The case is an interesting one, as the coal company now threatens to sue the county, and it is not definitely known whether the lands of the company contain deposits of any great value or not, although it is generally thought that they do. If the company sues the county, it will be up to the county to show that the lands do contain large deposits, and this will greatly increase the value of the lands to the company, at the expense of the county. The stated object of the survey is to locate other lands that are believed to be valuable.

Pittsburgh, Penn.—By an agreement filed in the United States District Court the opposition which the Pennsylvania R.R. has waged against the Wabash R.R. has ceased. The document which has just been approved by the court provides for a switch connecting the lines of the Pennsylvania with those of the Wabash at a point 11 miles outside this city. By this connection 3,400,000 tons of bituminous coal originating on the Wabash road will have access to the markets reached by the Pennsylvania R.R. Thus has ended a fight of many years, which was begun by the Pennsylvania before the Wabash even got into Pittsburgh and has continued ever since. While the Wabash has had connections for a long time with other roads in this territory, the shippers of coal were not satisfied until their product had an outlet into the Pennsylvania territory.

Anaconda, Mont.—Complete electrification of the Washoe coal mine, belonging to the Anaconda Copper Mining Co. is now under construction. The electric power plant will consist of a 150-kw. turbine generator, the power of which will operate the tipple. Later on, more generators will be installed as the work of electrification nears completion. The company is preparing to embark in the commercial coal business on Oct. 1. Shaker screens of five different sizes are being installed for the following grades of coal: Lump; egg; No. 1 nut; No. 2 nut and slack. Three new bunkers to hold 225 tons are being built for the nut and slack coals, while the old tipple is being reinforced for use in loading the egg and lump coal. Six hundred tons of coal are being mined per day at present, and the increased production from the No. 3 vein, now under development will increase this to 800 tons before winter. Heretofore the Copper company has used its entire product itself, and this will be its first venture into the commercial field with coal.

Coal Trade Reviews

General Review

Fall buying of anthracite opening up. Bituminous feeling the impetus of the improved industrial conditions. Profitable figures on export business. Lake trade shows a gratifying increase. Notably better tone in the Middle West.

Anthracite—The return of householders from summer vacations started coal moving into the consumers' bins, and there is a noticeably better feeling in anthracite circles. Most of the new business has gone to the independent operators at their cut rate figures, but they are now covered with orders close to capacity, and are taking a notably firmer position as regards prices. Moderate concessions will continue the rule until well into the winter, as is always the case, but it is noted that conservative dealers are generally planning to carry full stocks through to Apr. 1, when the new wage scale comes up for consideration. Long-term credits continues to exert an unsettling influence on the market, but the announcement that the new rate decision will not become effective until Dec. 1, has restored confidence of the buyers for the time being.

Bituminous—The bituminous trade is slowly responding to the improved conditions, and there is sufficient business now on hand to keep the accumulations at the loading piers down to a healthy basis. The movement on regular contracts is larger, and manufacturers are showing a disposition to follow the example of some of the larger railroad systems by accumulating surplus stocks. There is less demurrage coal at the distributing centers, and the trade is maintaining an even price level though there is still a slight indication toward heaviness. On the better grades it is generally agreed that they are in a strong position for the balance of the season.

Exports—The off-shore business continues brisk with inquiries plentiful. It is now developing that most of this business is being negotiated at about 10c. per ton above ruling figures on domestic contracts, and generally with the understanding that payment be made before shipment. High ocean freights continue the ruling feature in this branch of the trade. In the coastwise service, quotations on vessel tonnage are nominally unchanged, but are undoubtedly stiffer and susceptible to the least intimation of any general expansion in the demand for vessels.

Lake Markets—There has been a general and decided impetus to the Lake trade, as the end of the season approaches, and it is expected that this will now continue about normal until the close of navigation. Reports from the Northwest are to the effect that coal is moving out to interior points much more freely, and the situation in this department is decidedly more cheerful, though the tonnage for the season will undoubtedly show a heavy loss. Fuel consumption in iron and steel lines in the Pittsburgh district is probably very close to the maximum. The improvement has also spread to the domestic trade, though to a lesser degree. The cool weather has started coal moving out of the retail yards, forcing the dealers into the market, and there is a tendency to buy more freely.

Middle Western—The first half of the current month has witnessed a gratifying expansion of business with renewed activity, and there is a genuine feeling that the market has taken a definite turn for the better. There are quite a few companies that are carrying over some low-priced business from the recent period of depression, while the new advanced circulars have had a tendency to restrict buying, but this is generally regarded as only temporary, and a vigorous demand is expected to develop before the end of the current month. The screenings situation continues to drag, the larger domestic demand having resulted in an increased production of screenings as well. The current market in the Middle West is characterized by a generally close adherence to list prices, and a snappy demand.

A Year Ago—Anthracite trade steadily improving as the season advances. Operations active and the full circular prevails. Bituminous steam trade disappointing in all parts of the country, but operators continue confident as to the future. Market well maintained. Domestic grades beginning to open up as the season advances.

BUSINESS OPINIONS

Boston News Bureau—The sensational position of sterling exchange not only tends to restrict business in exchange, but in all branches of trade save those engaged in producing war munitions. War orders for the allies are being received in such volume that even a loan of $500,000,000 would not restore sterling exchange to the normal. As it is, exchange is accumulating and is being pressed for sale on a market where there is no demand of consequence. Few men are found who are willing to predict the course of trade or prices the next few months. Money is becoming so abundant that the banking element is extremely confused as to how to invest its idle surplus. We are still dominated by war developments. Fundamental conditions could hardly be more encouraging. We are rich in money and products and these resources must finally restore confidence. The present resting spell may prove beneficial.

Iron Age—A significant turn in the steel trade is the beginning of rail orders for spring rolling. The Louisville & Nashville has bought 43,000 tons from the Steel Corporation and the Atlantic Coast Line 20,000 tons for such delivery. The New York Central Lines are taking up their next year's requirements, and an Eastern road is figuring on rollings before winter for rails it will lay in the spring. The steel industry is makink new production records. In August the Steel Corporation produced more ingots than in any other month. Its statement of unfilled orders is expected to show an increase for August, but only a moderate one in view of the large amount worked off in the month.

American Wool and Cotton Reporter—Waiting for the London sales to open and also for word in regard to the embargo on crossbred wools largely influenced the course of the wool market last week. Partly owing to the week-end holiday there was less activity than usual. As a limited quantity of crossbred wools may be exported from London, it is expected that some of these will arrive in the American market within a few weeks.

Marshall Field & Co.—Improvement and better feeling have been apparent in dry goods trading during the week, due in part to more seasonable weather for retail selling and for the maturing of crops. Wholesale shipments have about equaled the unusually heavy distribution of the corresponding week a year ago. More retailers have visited the market, and collections are normal. Our retail sales this week have been especially heavy.

Dry Goods Economist—Importers are naturally gratified at the action of the British Government in permitting the shipment to this country of all goods bought or contracted for by American firms from German and Austrian houses prior to Mar. 1 last.

Bradstreet—Growth in trade and in leading industries is of a cumulative character. Misgivings as to the future seem to have practically disappeared, and though there are some unsettling factors, such as the very weak condition of foreign exchange and the fickleness of labor, the general tendency is onward and upward. This week's chief stimulus to trade is furnished by fall festivals, by visits of country merchants to the larger centers, improvement in house trade, larger road orders, rather freer orders for fall delivery, and by still geater activity in the steel industry.

Dun—Restraint upon new enterprise slackens as international diplomatic relations improve, but the derangement of foreign exchange continues a distrubing element in financial and export circles. Depreciation of European funds in this market has reached the stage where interference with oversea trade is threatened, although no actual check to merchandise shipments has thus far occurred. Important problems, however, are diminishing in number and there is a growing belief that current business progress will not be seriously impeded. Even the notable revival of activity in some directions is less impressive than the general restoration of confidence, without which a return of full prosperity would not be possible.

ATLANTIC SEABOARD

BOSTON

Pocahontas and New River have become generally firm, with only light accumulations. An optimistic feeling is now generally apparent. Georges Creek unchanged but Pennsylvania grades show slight improvement. Anthracite begins to move to the consumer and wholesale trade is looking up.

Bituminous—Practically no shading has been reported on the standard grades and all the important shippers have such an amount of business in hand that accumulations of coal at the loading piers are relatively small. The export trade is steadily improving and the balance of 1915 will probably show the record tonnage for foreign clearances. A few of the agencies are accepting what little spot business offers at $2.85 f.o.b. for coastwise delivery, but not so much because they need business as to keep in touch with New England buyers.

Little is heard about possible proposals on the Boston & Maine R.R. contract. This particular order has been held for several years by interests shipping via Norfolk but not from the Pocahontas or New River fields. It would be a sizable order for any shipper to lose and it will be decidedly interesting to see whether this tonnage stays where it is or whether the order is awarded to interests that ship over the Western Maryland or the Baltimore & Ohio.

Full contract figures are being realized for what Georges Creek reaches this territory. The tonnage continues small, with loading at Baltimore still subject to the claims of foreign bottoms for preference in loading.

Only a hand to mouth business is being done by the shippers of Pennsylvania grades. Inquiry is slightly improved, but not enough to make prices any firmer. The minimum range still obtains, but less coal is on demurrage at the loading piers and fewer sacrifice sales are reported. A fair amount of tonnage is coming to this territory in conjunction with anthracite in barges from Philadelphia.

Water Freights—While coastwise rates are nominally unchanged, the market is very susceptible to the least intimation of any charter demand; 75@80c. is the prevailing rate to Boston from Hampton Roads, but quotations to points other than Boston, Providence, or Portland are rather higher than the usual differential calls for. Bangor charters are ordinarily to be had for 15c. up from the Boston rate, but recent charters have been made at $1@1.10.

Anthracite—The companies appear to be moderately well supplied with orders for the present. Retail demand has started up throughout New England and shipments that were to be withheld are now required as promptly as possible. Some of the more conservative dealers are frankly pursuing the policy of keeping a full stock throughout the fall and winter. While receipts during the summer were somewhat lighter than in 1914 it is predicted now that the fall months will more than make up for any deficit.

Bituminous prices at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$0.90@1.40	$1.15@1.65	$1.67@1.77	
Philadelphia*	2.15@2.65	2.40@2.90	2.92@3.02	
New York*	2.45@2.95	2.70@3.20	3.22@3.32	
Baltimore*	....	....	2.85@2.95	
Hampton Roads*	....	....	....	$2.80@2.85
Boston†	....	....	....	3.58@3.78
Providence†	....	....	....	3.50@3.73

* F.o.b. †On cars.

NEW YORK

Better feeling in anthracite circles. Many new orders received. Improvement in line trade. Bituminous situation encouraging. Contract holders taking full quota. Railroads continue to store.

Anthracite—A slightly better feeling exists in the anthracite trade. Dealers are receiving many new orders, some for immediate delivery, and there has been a noticeable improvement.

The announcement from Washington that the Interstate Commerce Commission had extended until Dec. 1, the time for putting into effect the new rates and orders affecting a change in the transporting of hard coal, had a quieting effect on the trade. Wholesalers now feel they can go ahead on a safe basis for at least a few months.

With the passing of Labor Day and the practical ending of the vacation season many householders will return to their winter homes within a short time. This will enable retailers to fill many empty bins. While they have plenty of coal on hand to care for these orders the diminishing of stocks will cause them to place new orders and this will mean an improvement in the general situation.

More improvement has been noticed in the line trade than at tidewater. There has been an increase along Long Island Sound and in New England. The mines worked about four days this week but a better working schedule may be expected shortly.

Demand for the various sizes show little change. Egg and stove are in fair demand but there is a surplus of chestnut. The steam sizes are dull. Pea coal continues plentiful, as is also No. 1 buckwheat. Nos. 2 and 3 buckwheat, of the better grades, are practically out of the market.

Current quotations follow:

	Lower Ports		Upper Ports	
	Circular	Individual	Circular	Individual
Broken	$5 05		$5.10	
Egg	5.30	$4.80@5.30	5.35	$4.90@5.35
Stove	5.30	4 80@5.30	5.35	4.90@5.35
Chestnut	5.55	5.00@5.55	5.60	5.10@5.60
Pea	3.50	3.25@3 50	3.55	3.50@3.55
Buckwheat	2.75	2.25@2.75	2.80	2.25@2.80
Rice	2.25	1.75@2.25	2.30	2.00@2.30
Barley	1.75	1.45@1.75	1.80	1.75@1.80

Bituminous—Interest in the bituminous trade is concentrated on the opening of bids for furnishing from 500,000 to 600,000 tons of coal for the Panama R.R. Many dealers take the prices made on this business as a basis for next year's contracts (see contract 1327, p. 446).

While large consumers continue to take better tonnages on their contracts, spot coal demand shows no improvement. There is a well-defined belief that the coming fall and winter will see a shortage of supply and some manufacturers who permitted their stock piles to dwindle are making inquiries. The railroads who are good barometers continue to place large orders for storage purposes. Shippers, as a rule, are sending full quotas on contracts. Fears of a serious car shortage and the prospects of labor trouble in the spring are increasing among the trade.

Prices remain about the same as a week ago. There have been slight changes in quotations but these were not permanent. The gas-coal situation has improved considerably. Exporters report good business with many new inquiries being received.

Current quotations are on the following basis:

	South Amboy	Port Reading	St. George	Mine Price
Georges Creek Big Vein	$3.20@3.30	$3.20@3.30	$3.20@3.30	$1.75@1.85
Georges Creek Tyson	2.90@3.00	2.90@3.00	2.90@3.00	1.35@1.45

Steam	....	2.45@2.50	2.45@2.50	.90@ .95
Western Maryland	....	2.35@2.40	2.35@2.40	.85@ .90

PHILADELPHIA

Anthracite shows fair improvement. Pea coal stronger but chestnut continues weak. Other sizes slightly off circular, but the outlook is more favorable. Bituminous picking up slowly. Short labor and car supply interfering with shipments.

Anthracite—The slight improvement recorded last week continues. All companies report a fair increase in orders, due probably to the recent very cool weather. One of the largest retail companies put on forty extra teams in one day. Of course this was only temporary, but it goes to show that with the first touch of cold weather the people are compelled to order coal on account of very little having been stored so far. Unless all signs fail, September is going to be up to the average or better.

Most of this increased business has gone to the individuals, who still have prices low enough to attract the greater portion of the trade. However, there is no doubt that this condition will change from now on, as the small shippers are practically up to their capacity and when the heavy demand begins the dealers will turn to the large companies. Price cutting by the individuals may be continued long into the fall, even though it should only be from ten to fifteen cents a ton; however, this is all dependent on climatic conditions. It is expected, too, that late in the year any limited price cutting would be of small effect and the dealers will then no doubt be tying themselves up with the largest shippers in order to avoid any risk of depleted stocks and a possibility of paying premiums when the rush comes about.

It has recently come to light that considerable August coal was bought subject to November billing. It was hoped that the market had seen the last of the long-time credits which have been a feature for many months, for they do not create a healthy condition by any means, as some shippers are sure to learn to their sorrow. It is certainly going to be a difficult matter to get the trade back on a 30- or even 60-day basis.

Pea continues to strengthen slightly and the very low prices of the past several months are only history now. The larger companies, who claim not to have sold any lower than $2 have stated to their customers that they cannot promise shipments at this price beyond the present month, and it would not be at all surprising if $2.25 were asked before the close of next month. There appears to be a concerted effort to get pea back to the position where it is felt it should be as compared with the price of prepared coal. Chestnut continues to cause anxiety with scarcely any tonnage moving into the yards of the dealers.

The prices of the leading companies, according to the September circular, to which the state tax of 2½% must be added, are as follows:

	Line	Tide		Line	Tide
Broken	$3.50	$4.75	Pea	$2.50	$3.25
Egg	3.75	5.00	Buckwheat	1.25	2.25
Stove	4.00	5.00	Rice	.85	1.75
Chestnut	4.15	5.25	Barley	.50	1.50

Bituminous—The bituminous trade is beginning to respond to the improved business conditions. There is no rush, but fair orders are being received and a good many of the shippers report full-time operations at the mines. Labor shortage is acting as a slight deterent, and the current week also showed a car shortage in certain of the mining districts, especially on the lines of the B. & O. Shippers are reporting a good tonnage to the lake district.

Export business continues brisk, with inquiries very plentiful and vessel tonnage still short. It has been learned that most of this business is being taken at about ten cents a ton higher than the domestic trade, with the money generally in hand before shipment. The market is quotable as follows:

Georges Creek Big Vein	$1.65@1.75	Fairmont gas, ¾	$1.20@1.30
South Fork Miller Vein	1.50@1.60	Fairmont gas, mine-run	1.05@1.15
Clearfield (ordinary)	1.00@1.20	Fairmont gas, slack	.70@ .80
Somerset (ordinary)	1.00@1.15	Fairmont lump, ordinary	.90@1.00
West Va. Freeport	.85@ .95	Fairmont mine-run	.85@ .90
		Fairmont slack	.60@ .70

BALTIMORE

Steady improvement to the coal trade. Normal fall conditions about in sight.

Prices are stiffening slowly as the tide of demand is wiping out the surplus production of the mines. Very little low-grade coal is now offering below 80 and 85c. Ordinary coals of Pennsylvania are now bringing from 90c. to $1. Slack, selling recently at 45 to 50c., is now commanding from 65 to 75c. The Baltimore Retail Coal Exchange has set the following fall schedule for the trade: Lykens Valley, No. 2, $8.35; No. 3, $8.60 and nut, $8.60. Sunbury, No. 2, $7.60; No. 3, $7.85, and nut, $8.10. Hard, No. 1, $7.10; No. 2, $7.35; No. 3, 7.60; nut, $7.85, and pea, $5.60.

Exports are holding up well. During August a total of 215,796 tons, valued at $624,389 was loaded here for foreign delivery.

HAMPTON ROADS

Export shipments continue heavy. Little free coal available. Dumpings for month of August amount to 1,561,284 tons.

Coal shipments from Tidewater have been heavy to the foreign markets and there has also been a fair movement coastwise and some government takings. The export movement has been the heaviest to Italy although the largest single cargo of the week went to Cristobal, Canal Zone. Coastwise shipments have gone principally to New England ports with some small cargoes South, and have consisted of high volatile, Pocahontas and New River.

The total dumpings over the three railway piers for August reached the enormous figure of 1,561,284 tons. This is just about one thousand tons below the July movement and is somewhat disappointing as it was expected that the total figures would at least reach 1,600,000 tons. Of the total dumpings the Norfolk & Western handled 790,860 tons, the Chesapeake & Ohio Ry. 467,147 and the Virginian Ry. 303,277 tons. The movement via the Virginian and C. & O. both show an increase over July shipments but there is some falling off in the Norfolk & Western dumpings. The Virginian gain over July figures is only small, but the C. &. O. Ry. showed a decided increase and came within a few thousand tons of making a record for that road.

Railroad Tonnages—Dumpings over the local piers for the past several weeks compare as follows:

	Week Ending				
Railroad	Aug. 7	Aug. 14	Aug. 21	Aug. 28	Sept. 4
Norfolk & Western	135,357	171,252	172,546	211,699	232,394
Chesapeake & Ohio	110,861	83,390	129,826	103,472	82,485
Virginian	64,397	63,066	77,136	82,131	....
Totals	310,515	317,708	379,508	397,302	....

G.B. Warren	Sewells Point	1,616	
Maritime	San Fran.	3,598	4.25[1]

[1] Sept. $1.20.

OCEAN FREIGHTS

There has been very little change in the freight market during the past week, and although we chartered a number of steamers for export coal they were all at or about rates recently quoted. We would quote freight rates on coal by steamer as follows:

To	Rate	To	Rate
Havana	$2.50@3.00	Bermuda	**$3.00**
Cardenas or Sagua	2.75@3.50	Vera Cruz	3.50@3.75
Cienfuegos	3.25@3.50	Tampico	3.50@3.75
Port au Spain, Trinidad	3.75	Rio	8.04@8.16
St. Lucia	3.50@3.75	Santos*	8.16@8.40
St. Thomas	3.00@3.25	Montevideo	**8.04**
Barbados	**3.75**	Buenos Aires or La Plata†	**8.04@8.16**
Kingston	2.75@3.25	Rosario	**8.40**
Curacao	3.25	West Coast of Italy	9.84@10.08
Santiago	2.75@3.25	Barcelona**	9.12@9.36
Guantanamo	2.75@3.25	Valparaiso or Callao	7.00
Demerara	4.50@5.00	Marseilles	9.36@9.60

Note—Rates noted in **bold face** type are only approximate.

* Consignees paying dockage dues. ** Spanish dues for account. † Quotations on Plate coal by British steamers; neutral steamers are more difficult to obtain and the rates are always higher.

W. W. Battie & Co.'s Coal Trade Freight Report.

Note—Charters for Italy, France and Spain read: "Lay days to commence on steamer's arrival at or off port of discharge. 24c. per net register ton per day demurrage."

LAKE MARKETS

PITTSBURGH

Heavier Lake movement and demand better in other quarters. Operations increased and now between 60 and 70%. Prices firmly maintained.

There has been a decided increase in the Lake movement and expectations are entertained that from now to the end of the season the movement will be practically normal, though even this will make a low total for the season. The ore trade has livened up in remarkable manner. The August ore movement was by far the best of the season and the prediction is made that shipments from Sept. 1 to the end of the season will be equal to the record for that period.

The iron and steel industry has increased its consumption of coal somewhat and consumption in this direction is probably equal to the best rate ever reached. There has been a slight increase in the requirements of other industries. Railroads are also taking somwhat more coal. Retailers are beginning to stock for the regular fall movement but shipments to retailers are thus far not very heavy.

Mine operations in the Pittsburgh district are between 60 and 70% of capacity, probably nearer the higher figure, and somewhat heavier operations are likely in the next two months.

Prices for free coal are quite firmly maintained as follows: Slack, 50@60c.; nut and slack, 90@95c.; nut, 95c.@$1; mine-run, $1@1.05; ¾-in., $1.10@1.15; 1¼-in., $1.20@1.25, per net ton at mine, Pittsburgh district. On contracts to Apr. 1 the market is firm as follows: Slack, 85@95c.; mine-run, $1.15; ¾-in., $1.25; 1¼-in., $1.35.

BUFFALO

Fairly good reports in bituminous. Tonnage increasing. Prospects good for active fall trade. Dealers eager for better movement. Stir in anthracite should begin soon.

Bituminous—Shippers are somewhat puzzled over the increased demand. They agree that it has increased, but it comes so irregularly that it is hard to estimate. There is at least improvement enough to cut out all the very low-priced coal of the earlier part of the year. Slack is stronger and is now back to its old price of about 35c. lower than Pittsburgh mine-run, where it will no doubt stay till after the Lakes close. The Lake trade, when in active condition, turns out a large amount of slack, on account of the shipping of so much three-quarter, but the Lake trade has been dull lately, so that slack should be strong in December.

There is no further report of coal-car shortage, but it is sure to happen as soon as the crops begin to move. The roads have already withdrawn their gondola cars mostly from the coal trade, as they are primarily intended for carrying iron and steel. Some of the leading Pittsburgh coal companies having made a special fall price for the Buffalo market, which they seldom do, and the following will be the basis till further notice: $2.65 for best Pittsburgh lump, $2.50 for three-quarter, $2.40 for mine-run and $2.05 for slack. Allegheny Valley sizes remain about 25c. below Pittsburgh.

Anthracite—There is a slight stir among the buyers at retail, but the demand is not likely to be at all large for some weeks yet. It requires actual starting of fires to make any impression on most consumers. Reports from beyond Lake Michigan are that buying has begun in a healthy way. Lake shipments of anthracite from this port are mainly dependent on such buying and they have been light. For the week the total was 109,237 tons, for the month of August, 509,935 tons and for the season to September they were 2,380,325 tons. The amount last season to September was 2,728,345 tons. The excess of last season was almost entirely on account of the light shipments last July. It is not likely that the loss will be made up.

Anthracite mines are still running slow and in addition are obliged to stock considerable of their output. It is said that the slow buying is largely on account of the readjustment of freight rates, some idea being that there may be a still further change.

COLUMBUS

A marked improvement is noted in every department of the coal business. Domestic and steam trade both more active. Future prospects are brighter.

The trade is showing a definite improvement in every way. Orders for both steam and domestic sizes are coming in better with the result that prices have stiffened materially. The whole tendency is toward higher levels and the worst of the depression is now believed to be over. There is a more optimistic feeling in coal circles and future prospects are brightening.

Dealers' stocks were not large and when the better demand came these soon dwindled so they were forced to put in orders for large shipments to come forward at once. Comparatively few orders are taken for delivery at a future date. Rural dealers are also experiencing a better demand since the farmers have time to haul their winter's supply. Retail prices are stiff and some small increases have been recorded.

The steam business is more active in every direction. Manufacturing is on a larger scale and fuel reuisitions are gradually increasing. Railroads are also stocking up tonnage to be on the safe side. Steam grades are stronger in price and the tendency is to buy more liberally.

The lake trade is more active as the end of the season approaches. Reports from the Northwest show that the movement off the docks to the interior is larger. Chartering of boats is going on actively and a large tonnage will be moved to the head of the Lakes from this time to the close of navigation. A large percentage of the coal loaded at Ohio Lake ports comes from West Virginia.

Prices in Ohio fields are as follows:

	Hocking	Pomeroy	Eastern Ohio	Kanawha
Re-screened lump.......	$1.50	$1.50		
Inch and a quarter......	1.40	1.40	$1.30	$1.30
Three-quarter inch......	1.25	1.25		1.25
Nut..................	1.15	1.25		1.15
Mine-run...............	1.05	1.10	1.00	1.05
Nut, pea and slack......	.65	.70	.55	.65
Coarse slack...........	.55	.60	.45	.55

Mines have been working at about the following percentages of full capacity:

District	Week Ended Aug. 14	Aug. 21	Aug. 28	Sept. 11	District	Week Ended Aug. 14	Aug. 21	Aug. 28	Sept. 11

Crooksville.	30	30	30	35					
					Average..	30	33	34	41

CLEVELAND

Warm weather has somewhat interfered with the retail business. The lake trade will be much heavier by Sept. 15.

The closing down of factories over Labor Day gave the plants two idle days that cut into the demand for coal. The market cleaned up well, however, and prices are the same as they have been for the last two weeks. The receipts over Sunday and Monday were held firmly the few hours offices were open Labor Day.

The retail trade has suffered because of the warmer weather but this is only temporary. Discounts ended on hard coal and coke delivered prior to and paid for on Sept. 1, but not so many people took advantage of these as usually do.

In the Lake trade very little is expected at Lake Erie ports for a week. The mines will hardly get back in full operation before the last of the week and Lake coal will not be forthcoming in quantities until next week. Shipping orders have been received for a large tonnage to be floated, but operators cannot get to this business until about Sept. 15 because of the break in mining operations.

Jobbers are looking for a drop in the prices of fine coals after the middle of the month as the Lakes take practically nothing except three-quarter coal. Most jobbers are buying slack only as they have call for it for this reason.

Quotations to jobbers for shipment are as follows:

	Pocahontas	Youghiogheny	Fairmount	Bergholz	Ohio No. 8
Lump.............	$3.70			$2.30	
Lump, 6-in........				2.30	
Lump, 1¼-in.......				2.10	$2.10@2.15
Lump, ¾-in.......		$2.15@2.20	$2.00	2.00	2.00
Egg..............	3.70			1.95	
Mine run.........	2.70	2.10@2.15	1.90	1.85	1.80@1.85
Slack............		1.55	1.70	1.50	1.50

LOUISVILLE

Improved tone to the market. Buyers in the market for larger tonnages.

The coal market is in much better condition than it has been, and the feeling is generally stronger. Prices have been advancing somewhat, and the buyers are covering their requirements as much as possible on the present price levels, since it is evident that an upward movement is on. Dealers have hesitated to stock up, but recent cool weather, which has stimulated the movement to consumers, has likewise resulted in a better demand from the yard men.

The regular run of Eastern Kentucky coals are selling at $1.60 to $1.75 for block, with egg at $1.25 to $1.30 and nut and slack from 65 to 70c. These prices represent a fair advance as compared with last week, and likewise are significant of a change from a buyer's to a seller's market. Fancy Jellico lump coal is being held around $2 a ton. Western Kentucky coals are also profiting by the improvement.

CINCINNATI

Sluggishness in the domestic market continues. Prices low, and no improvement in sight.

With a firm impression prevailing among retailers, that they can get all the coal they want the domestic market is dull. It is a fact that while dealers stocks are much below normal, they have some coal bought at bargain prices, which is relied on to last them should an unexpected demand develop. Steam consumption is still much below what it should be, also, making the entire market sluggish. The only factor, it seems, which can liven things up is something like a normal fall demand.

COKE

CONNELLSVILLE

Prompt furnace coke low but with limited offerings. Trade trying to develop a price for first-half deliveries. Another byproduct plant. Production slightly increased and shipments slightly decreased.

Sales of prompt furnace coke have continued at $1.60 and there are only very limited offerings at this figure, most operators quoting $1.75. The great question before the coke operators now is the price furnace coke should bring for the first-half of 1916. There have been some tentative inquiries from furnace interests but buyers and sellers are far apart. No bids have been made and it cannot be found that any definite quotations have been put out by operators. With the iron and steel trade so prosperous operators think they should obtain say $2.50 for the first-half, but it is practically out of the question to expect to obtain such a price when prompt coke is $1.60. Sliding scales, based on basic pig iron at valley furnaces, are being discussed. For the balance of this year $2 is mentioned in a general way but negotiation might develop a lower figure.

Andrews & Hitchcock have put in a second blast furnace at Hubbard, Ohio, and prospects are that two or three furnaces in the Shenango Valley will blow in shortly. The La Belle Iron Works, Steubenville, Ohio, which has contemplated building a byproduct coke plant for some time, has let a contract for 96 byproduct ovens, to have an output of about 1000 tons of coke daily. The market is quotable as follows: Prompt furnace, $1.60@1.75; September furnace, $1.75; furnace to Jan. 1, $2; prompt foundry, $2.25@2.60; contract foundry, $2.30@2.60, per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Aug. 28 at 391,310 tons, an increase of 8,704 tons, and shipments at 388,107 tons, a decrease of 5,521 tons.

Buffalo—There is a good movement, prices holding firm. It does not appear likely that an advance will take place right away, as efforts to secure one do not succeed. Still the iron trade is very active here. Late sales have about taken the local output for the entire year and pig iron has lately advanced. The Buffalo prices of coke remain firm, on the basis of $4.25 for best 72-hr. Connellsville foundry and $3.30 for stock coke.

Chicago—Shippers of furnace and foundry coke are still enjoying a brisk business, and a further advance in prices is expected on spot deliveries very shortly. Byproduct sizes have been quiet during the past week, and gas house coke has not been so strong. Quotations are as follows: Byproduct foundry, $4.90@5.10; byproduct domestic, $4.65@4.75; Connellsville, $4.75@4.90; Wise County, $4.75@5; gas coke, $3.75@3.90.

MIDDLE WESTERN

GENERAL REVIEW

Strengthening seen in all directions. Demand for domestic grades stiffened. Screenings steady in the face of increased production. Anthracite orders in better volume.

Expansion of business and renewed activity has ruled during the closing days of August. There is a genuine feeling that the market is on an upward trend, and at a rapid pace at that. A great many operators in Indiana and Illinois claim that they have enough domestic orders to absorb production of coarse sized coals for the next three or four weeks. Inquiries are abundant; but little cheap coal is offered; the attitude towards contracting at low prices has changed; car shortages are reported more frequent, and some announcements are being made of delivery of cars to mines on a percentage allotment basis.

All domestic sizes have materially stiffened, and shippers are feeling encouraged over the immediate outlook. In some quarters it is reported that the higher prices quoted since the first of the month have slowed up orders the last few days somewhat, but this is considered only temporary in view of the possibilities of car and labor shortages in the near future, and renewed buying of a vigorous kind is expected by the middle of the month.

Industrial plants with heavy output are showing a disposition to increase their stocks. In the case of steel and allied industries, coal consumption is now exceeding the normal amount, and with the evident desire on the part of Western railroads to put coal in storage for future emergencies, the coal operator believes that better times are at hand.

CHICAGO

Mines working better and orders more plentiful. Smokeless more active. Advance in anthracite freights causes no increase in prices as yet.

Mines in southern Illinois are running almost full time, and those in the central district are doing better. It is said some of the Franklin County mines are now three weeks and more behind their orders on certain coarse sizes. Franklin and Williamson County screenings show a tendency to decline due to increased production of major sizes. Considerable fine coal tonnage is reported sold around 55c. Increased orders have been received for Harrisburg steam lump.

Conditions in the Springfield district are showing a steady improvement. The shippers report considerable increased activity with many inquiries, and a fair volume of orders. Springfield domestic lump advanced to $1.65 on Sept. 1. Screenings have gone forward steadily at prices ranging from 60 to 65c.

Orders for Indiana domestic lump have rapidly increased. Sullivan County mines have a surplus of egg and nut sizes which are being sold at from 10 to 15c. per ton under list. Clinton Third and Fifth Vein steam lump shipments have been very quiet. The Indiana retailers are coming into the market rapidly for local domestic coals for stocking purposes, and the difficulty now is to market the small sizes.

Smokeless contracts have been closed recently which had been hanging fire for a number of weeks past, and prior to Sept. 1 there was a brisk flow of orders. Few orders have been booked by smokeless operators for immediate delivery since Aug. 1. Cancellations and suspensions have been frequent for orders given in July with the expectation that the market would stiffen early in August.

Some of the splint operators have notified their customers that Sept. 1 their prices will be advanced, and current quotations will not be protected. This has caused some quickening in orders early this week.

A revival has occurred in Hocking domestic trade. Some of the operators are starting off September with strict adherence to the $1.50 price for 3-in. lump, $1.75 for 6-in. lump, and 1¼-in. lump at $1.35. Strength is exhibited in the small sizes, and fine coal is bringing around 55c. to 65c. Generally prices for Hocking coals are much better maintained than they have been for many months past.

All Kentucky coals are still dull.

Anthracite shows improvement, and so far Chicago representatives have not advised the trade of any advances to equalize the recent increase in freight charges on all-rail coal to Chicago. It is said that dealers are sending in more orders the last few days, which causes some to think that September will make a very good record for shipments.

Quotations in the Chicago market are as follows:

	Williamson and Franklin Co.	Springfield	Sullivan	Clinton	Knox and Greene Cos.

ST. LOUIS

Prices advanced though some low-priced contracts are carrying over. Demand strong on domestic grades.

With the first of the month at hand Franklin County domestic lump prices have advanced considerable. Many mines still have orders at lower prices, which were taken last month. The filling of these orders have been delayed on account of the shortage of cars produced by flood conditions in August.

The demand is strong on all grades of standard domestic sizes, while screenings are just a little weaker, with a steady demand. The better grades of DuQuoin coal are in strong demand at from $1.50 to $1.65 per ton mine for domestic 6-in. lump and egg, while screenings are moving freely at 55@60c.

Quotations are as follows:

	Big Muddy	Frank Co.	Carterville	DuQuoin
8-in. lump	$2.25			
4-in. lump	2.10			
2½-in. lump	2.00			
6-in. lump		$1.65@$1.75	$1.50@$1.60	$1.50

Prices quoted above are f.o.b. mine. The rates from mines to St. Louis are: Big Muddy, 70c., Franklin County and Williamson County, 72½c., DuQuoin, 62½c. East St. Louis rates are 35½c. per ton less.

INDIANAPOLIS

Mines have begun to increase output of domestic lump. Buyers looking for lower prices for slack but operators slow to accept lower figures.

The arrival of September put many Indiana mines to making domestic lump, preparatory to the first of the heavy buying by private consumers for the fall and winter season. An attempt was made, it is said, by some operators to start the season off at prices showing some increase over the summer schedule but it was found that other operators were content to sell at the old scale and it is evident that there can scarcely be an advance maintained until cold weather appears.

It is difficult to learn whether any of the operators have accepted the low bids of the buyers of slack but it is known that some of the mines are not disposed to sell at below the cost of production as was done last winter. There is practically no change in the railroad or industrial demand. The movement of domestic grades to schools, public buildings, apartments, etc., is taking on some activity.

PORTLAND

Local prices expected to advance shortly in conformity with the increase announced at mines in Utah and Wyoming. Fair volume of business looked for here the coming fall.

The coal business is quiet, but the outlook is for a fair volume of business in the fall as soon as cooler weather sets in. Coal men find buyers showing little disposition to put supplies in storage and hence they expect that when the cooler weather sets in orders will come briskly.

The mines in Utah and Wyoming announced an advance to $2.75 per ton on lump at the mines, a short time ago, but the retailers here have not yet added the increase. The freight to Portland from the mines in Utah is $4.50 per ton and from Wyoming 25c. less, leaving a margin of about $3 per ton for handling. Washington coal, from the Centralia district, is selling at $6 per ton, retail.

FOREIGN MARKETS

Aug. 27—There is a pronounced absence of business on the coal market and the general demand is unimproved. Quotations are nominally as follows:

Best Welsh steam	Nominal	Best Monmouthshires	$5.76@6.00
Best seconds	Nominal	Seconds	5.28@5.52
Seconds	$5.76@6.00	Best Cardiff smalls	4.56@4.80
Best dry coals	5.76@6.00	Cargo smalls	2.88@3.36

The prices for Cardiff Coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport, both net, exclusive of Wharfage.

Freights—Chartering is on a fairly active scale but tonnage is still scarce. Rates are approximately as follows:

Gibraltar	$3.96	Naples	$6.96	St. Vincent	$4.32
Marseilles	6.76	Alexandria	7.44	Rio de Janeiro	5.04
Algiers	5.22	Port Said	7.20	Monte Video	4.80
Genoa	6.96	Las Palmas	4.08	Buenos Aires	5.04

CONTRACT NOTES

Netherlands—There is great demand and agitation for coal. The Netherlands Oversea Trust will now issue licenses for American coal.

Louisville, Ky.—The Alfred Shuck Co. consume about 450 tons of nut and slack coal per year. Deliveries are made by railroad at the rate of 40 tons per month, and they have a storage capacity of 100 tons.

Philadelphia, Penn.—Smedley Bros. Co. at this place consume about 300 tons of bituminous coal per annum. Deliveries are made by railroad and they have a storage capacity of 100 tons. Address Secy. R. L. Hilles, Smedley Bros. Co., Frankford, Philadelphia, Penn.

Paraguay—A dealer in builders supplies in Paraguay informs an American consular officer that he desires to buy foundry and furnace coke. He has been paying $13.51 per ton f.o.b. Buenos Aires, and $20.26 per ton c.i.f. destination. He buys about 300 tons per annum. Correspondence should be in Spanish.

Cincinnati, Ohio—The King Machine Tool Co. uses approximately 750 tons of 1¼-in. screened gas coal. Deliveries are made by railroad. They have a storage capacity of 400 tons and deliveries are made only twice a year. They do not contract. Address Pur. Agt. E. A. Muller, King Machine Tool Co., Clifton Ave., Cincinnati, Ohio.

Louisville, Ky.—The Belknap Hardware & Manufacturing Co. at this place consume about 8000 tons of pea and slack coal per annum. Deliveries are made by railroad at the rate of 100 to 200 tons per week, and they have a storage capacity of 200 tons. Address Pur. Agt. J. N. Hall, Belknap Hardware & Manufacturing Co., Louisville, Ky.

Alliance, Ohio—The contract for furnishing the local schools with coal during the ensuing year has been awarded to **Wright & Zehner** on Hocking ¾-in. at $2.15. Other bids were J. H. Miller & Son, Alliance, Pittsburgh No. 8 lump at $2.25; E. M. Lincke, Alliance, Bergholz ¾-in. coal at $2.15; I. G. Tolerton & Son, for Pittsburgh No. 8. ¾ in. at $2.30.

Madison, Wis.—Contract of the Northern Electric Works of the General Electric Co. at Madison, Wis., for 1200 tons of screenings annually, and for 1500 tons of screenings annually consumed by the Edison Lamp Works of the General Electric Co. at Fort Wayne, Ind., has been awarded to the **Consolidated Indiana Coal Co.** on Argyle, W. Va., screenings, at a price of 75c. per ton f.o.b. mines. Address Purch. Agt. Geo. F. Hinman, General Electric Co., Schenectady, N. Y.

Russia—For small parcels, not contraband, Tornea-Bergen is the best route for exports from Russia; for large consignments, Archangel-New York. Fourteen days is the time for the regular service. The steamers of the Russian American Line sail every 11 days. Train connections in Russia are uncertain.

Oklahoma City, Okla.—The coal contracts for the Oklahoma state institutions have been let as follows: State University, Norman, 500 tons mine-run, at $3.14, to **M. B. Schofield & Co.**; School for the Deaf, Sulphur, 250 tons, mine-run, $2.25, **McAlester Fuel Co.**; Hospital for Insane, Norman, 550 tons, mine-run, $3.10, **National Fuel Co.**, and 950 tons, commercial lump, $3.90, **McAlester Fuel Co.**; School of Mines, Wilburton, 800 tons, mine-run, $2.25, **S. J. Katigan**; Colored Agricultural and Normal University, Langston, delivery to be made at Coyle, 800 tons, mine-run, $3.10, **McAlester Fuel Co.**; Institute for Feeble Minded, Enid, 500 tons, mine-run, $2.89, **M. B. Schofield**; Deaf, Blind and Orphan Asylum, Taft, 250 tons, mine-run, $2.40, **M. B. Schofield**; Girls' College, Chickasha, 120 tons, mine-run, and 80 tons nut, $3.40, **McAlester Fuel Co.**; East Central State Normal, Ada, 150 tons, mine-run, $2.57, **Fidelity Fuel Co.**; Northeastern State Normal, Tahlequah, 250 tons, mine-run, $3.30, **McAlester Fuel Co.**; Southwestern State Normal School, Weatherford, 508 tons, mine-run, $3.40, **Fidelity Fuel Co.**; Northwestern State Normal School, Alva, 250 tons, mine-run, $3.34, **M. B. Schofield**; Southeastern State Normal School, Durant, 250 tons, mine-run, $2.66, **McAlester Fuel Co.**; University Preparatory School, Tonkawa, 250 tons, mine-run, $3.09, **M. B. Schofield**; Eastern Oklahoma Hospital for Insane, Vinita, 1500 tons, mine-run, $2.75; **Catale Coal Co.**; Oklahoma State Home, Pryor, 120 tons, mine-run, $2.48, **M. B. Schofield**; Confederate State Home, Ardmore, 250 tons, mine-run, $3.30, **W. E. Beatty**; State Training School, Pauls Valley, 250 tons, mine-run, $3.05, **J. W. Hinton**, Dewar; State Hospital for Insane, Fort Supply, 2500 tons, mine-run, a carload trial order to be submitted by McAlester Fuel Co. at $4.36, M. B. Schofield at $3.59, J. W. Hinton at $3.95 and Fidelity Fuel Co. at $4.38.

Coal Contracts Pending

The purpose of this department is to diffuse accurate information of prospective purchases and prices with a view to affording equal opportunity to all, promoting market stability and inculcating sound business principles in the coal trade.

For the official advertisements of bids wanted see the Contracts-to-Be-Let Section on Page 16.

✚Indicates contracts regarding which official information has been received.

Supplemental Notes

Under this heading additional or supplemental information regarding old contracts appears, together with the page number of the original notice.

1044—Kansas City, Mo.—The Sewell Paint & Glass Co. will continue buying in the open market on this contract (p. 116), but are still looking for a favorable opportunity to cover their requirements. Address Purchasing Agent, The Sewell Paint & Glass Co., Kansas City, Mo.

1180—Columbia, Mo.—Bids were received on this contract (p. 244), which provided for furnishing the local Water and Light Department with approximately 8,000 tons of washed Nos. 3, 4 and 5 slack coal until 7:30 p.m., Sept .7. The contract becomes effective Sept. 12, and expires Sept. 1 of next year. Certified checks for $500 were required with each bid. Address City Clk. John S. Bicknell, Columbia, Mo.

1263—New Orleans, La.—It is understood that the Crescent City Stock Yards & Slaughter House Co. have already concluded arrangements for their coal on this contract (p. 324). Address Pur. Agt., Crescent City Stock Yards & Slaughter House Co., New Orleans, La.

1326—Dalton, Ohio—Bids have been received on this contract (p. 367), which provides for furnishing the fuel requirements for the Board of Education of Sugarcreek Township (p. 367), from John Caldwell, at $3.10 per ton, and E. P. Gerber, $3.25. These are the minimum figures, the prices going upward according to the length of the haul. Address Clk. Clayton L. Arnolud, Bd. of County Comrs., Dalton, Ohio.

1327—New York, N. Y.—Bids on this contract (p. 367), which provides for furnishing all or any part of the Panama R.R. Co.'s fuel requirements, estimated at from 500,000 to 600,000 tons of the best quality, semi-bituminous mine-run coal, were received, as follows:

Bidder	Tonnage	Price	Name	Delivery Point
J. W. Weaver & Co.	500,000	$2.60	"B" or "Miller Vein"	Philadelphia
B. Nicoll & Co.	500,000	2.50	"Belmont"	Newport News
B. Nicoll & Co.	50,000	2.60	"Cambria Smokeless"	Philadelphia
		2.53	"Cambria Smokeless"	Baltimore

Pocahontas Fuel Co.	600,000	2.85	"Pocahontas" or "New River"	Hampton Roads.

[1] to 600,000 tons. [2] Not more than 10,000 tons a month. [3] 15,000 tons per month. [4] Chesapeake & Ohio Coal & Coke Co. in their second bid of 225,000 tons offered to furnish 15,000 tons per month from Sept. 15, 1915 to Apr. 15, 1916, at $2.72 per to, and 24,000 tons per month from Apr. 15, 1916 to Sept. 15, 1916, at $2.79 per ton.

Address Asst. Pur. Agt. R. E. Rutherford, Panama R.R. Co., 24 State St., New York, N. Y.

New Business

✚**1365—Pittston, Penn.**—Bids will be received by the School Board until 8:15 p.m., Sept. 14, for furnishing and delivering fresh-mined coal for the school term of 1915-1916. Bids to be submitted on all sizes and certified check for $100 payable to the School Board for faithful performance of contract to be furnished. Address Secy. James A. Joyce, Bd. of School Dirs., Pittston, Penn.

1366—Chisholm, Minn.—Bids were received until 8:30 p.m., Sept. 8, for furnishing the Independent School District No. 40 with approximately 2,000 tons of Pocahontas mine-run coal, to be delivered in carload lots at the High and Lincoln School, 225 tons of Youghiogheny screened lump steam coal to be delivered in bins in carload lots at Myers, Shenango and Monroe schools, and some additional small tonnages. A certified check for 5% of the total amount of the bids must accompany all proposals. Address Clk. M. Tripp, Independent School Dist., Chisholm, Minn.

1367—Springfield, Mo.—The County Government will soon advertise for bids to furnish the court house, county jail and almshouse with coal during the ensuing year. About 50 cars will be required. The present contract has been held by the Merchants' Ice & Fuel Co. Address County Clk. John L. Likens, Springfield, Mo.

1368—New Orleans, La.—The St. Charles Hotel, at this place, is requesting bids on their coal requirements for the period from Oct. 1 of the current year, to June 30, of next year. About 3000 tons will be required. The coal will be bought on a heat unit basis. Address Secy. Treas. S. A. Trufant, St. Charles Hotel, New Orleans, La.

1369✚West Point, Neb.—Cuming County will receive bids until noon, Sept. 14, for furnishing 50 tons of Hocking Valley dock screened lump coal. Address County Clk. R. Brazda. West Point, Neb.

1370—Newark, N. J.—The State Board of Education will receive bids until noon, Sept. 11, for furnishing 250 gross tons of pea coal for the State Normal School at Newark. Deliveries are to be made as required during the period beginning Sept. 12 and ending Feb. 12 of next year. Address Pres. Joseph S. Frelinghuysen, Dept. of Public Instruction, State House, Trenton, N. J.

1371—New Orleans, La.—The Dixie Brewing Co., at this place, is said to be in the market for its annual contract which will be placed some time during the current month. They consume about 3000 tons of coal a year. Address Pres. Val Mertz, Dixie Brewing Co., New Orleans, La.

1372—Latrobe, Penn.—The School Board of Derry Borough will receive bids until 7 p.m., Sept. 13, for furnishing and delivering Jamison No. 1 grade mine-run coal to the three school buildings of the Borough. Address Pres. J. D. Neely, School Bd. of Derry Borough District, Latrobe, Penn.

1373—Chapel Hill, N. C.—The Blanche Hosiery Mills Co. at this place usually contract some time during September for their annual requirements of coal involving approximately 200 tons of Pocahontas mine-run. They have a storage capacity of 50 tons and deliveries are made by railroad. Address Purchasing Agent, The Blanche Hosiery Mills Co., Chapel Hill, N. C.

1374—Erie, Penn.—Sealed bids will be received for furnishing the Soldiers and Sailors Home with coal during the six months beginning Oct. 1 of the current year and ending Mar. 31 of next year. All proposals must be on forms prescribed, which may be obtained on application. For notice of the contract covering this business for the six months' period beginning Apr. 1 of this year, see "Coal Age," Vol. 7, p. 447. Address Col. John P. Nicholson, Flanders Bldg., 15th and Walnut St., Philadelphia, Penn.

1375—Newton, Iowa—The Newton Lodge No. 1270 B. P. O. E. will receive sealed bids for furnishing the local Post Office Building with coal during the period beginning Oct. 1 of the current year end ending July 1 next year. Bids are requested on mine-run, steam, and lump coal, and should include cost of delivery in the bins at the building. Address Secy. Lee Brown, Newton Lodge No. 1270, B. P. O. E., Newton, Iowa.

+1376—Ankeny, Iowa—The Ankeny Independent School District will receive bids until Sept. 15, for furnishing and delivering coal to the local school building as may be required during the ensuing year. Address Pres. G. E. Goughnour, Independent School Dist., Ankeny, Iowa.

1377—Louisville, Ky.—The coal contract for Levy Bros. at this place, involving about 50 tons of nut and slack coal per month, expires Sept. 28. Delivery is made by wagon. Address Fred C. Levy, Levy Bros., Third and Market St., Louisville, Ky.

+1378—Beaver Falls, Penn.—The Chippewa Township School Board will receive bids for furnishing 175 bu. of coal to be delivered at the four school houses in the township. Address Secy. J. R. Gormley, Chippewa School Bd., Beaver Falls, Penn.

1379—Wheeling, W. Va.—The Board of Education at this place usually contracts some time in October for their annual requirements of coal. The amount involved and price at which the business was done in the past few years was as follows: In 1909, 28,429 bu., at 7½c.; 1910, 34,597, 7⅓c.; 1911, 41,744, 7⅓c.; 1912, 34,097, 9½c. The call for bids is advertised. Address Clk. Frank Stanton, Bd. of Edu., Wheeling, W. Va.

+1380—New Sharon, Iowa—The Independent School District will receive bids until Sept. 13, for furnishing coal as may be required at the local school building during the ensuing year. Address Secy. J. B. Heitsman, New Sharon Independent School Dist., New Sharon, Iowa.

+1381—Chicago Junction, Ohio—The Board of Public Affairs at this place usually contracts about Oct. 1 for their annual requirements of coal involving approximately 2500 tons. The contract last year was let at $2.20 f.o.b. the plant for Pittsburgh No. 8, ¾-in. and Fairmont mine-run. Business is done on competitive bids. Address Clk. E. K. McMorris, Bd. of Pub. Affairs, Chicago Junction, Ohio.

+1382—Birmingham, Ala.—The Municipal Water & Light Department at this place usually contracts about Oct. 1 for their annual requirements of coal. On the current contract 1920 tons of mine-run coal is being used which was bought at $1.20 at the mine. Business is done on competitive bids. Address Supt. W. H. Abernathy, Municipal Water and Light Plant, Birmingham, Ala.

+1383—Miller, S. D.—The Hand County Board of Commissioners received sealed bids until noon, Sept. 7, for furnishing anthracite nut and Hocking Valley coal to be delivered in any part of Miller City as may be required. Address County Audr. D. A. Lewis, Bd. of County Comrs., Hand County, S. D.

1384—Louisville, Ky.—The Atherton Realty Co. will contract some time in October for its annual supply of coal, involving three or four tons per day. It uses nut and slack coal. Address Supt. Sanders, Atherton Realty Co., Atherton Bldg., Louisville, Ky.

+1385—Corydon, Iowa—The County Board of Supervisors will receive bids until 10 a.m., Sept. 13, for furnishing coal required at the Court House and County Home during the coming season. Lump coal is required; that for the court house is to be delivered in the basement and that for the County Home should be on track at Corydon, Iowa. Address County Audr. George S. Moore, Corydon, Iowa.

+1386—Mott, N. D.—The County Government received sealed bids until 2 p.m., Sept. 8, for furnishing 100 tons of lignite coal. The successful bidder will be required to furnish a bond for $200. Address County Audr. E. C. Roberts, Hettinger County, Mott, N. D.

+1387—Missoula, Mont.—The City Government will receive bids until 10 a.m., Sept. 15, for furnishing approximately 75 tons of coal. Address City Clk. L. E. Harris, Missoula, Mont.

+1388—Carlisle, Penn.—The Carlisle School District will receive bids for furnishing approximately 200 tons of bituminous coal to be delivered as required. Bids are to include cost of delivery to the various buildings. Address Chn. C. M. Liggett, Property Com., Carlisle, Penn.

+1389—Yankton, S. D.—The Board of County Commissioners received bids until 2 p.m., Sept. 7, for furnishing the best grade of screened Hocking Valley coal for use at the Court House and Jail during the period beginning with September of this year, up to and including April of next year. Address County Audr. W. O. Nelson, Yankton, S. D.

+1390—Trenton, N. J.—The New Jersey State Hospital will receive bids until Sept. 15 for furnishing coal as may be required during the ensuing year. Address Warden Daniel T. Atchley, New Jersey State Hospital, Trenton, N. J.

1391—Knoxville City, Iowa—The Independent School District of this place will receive bids until 7 p.m., Sept. 13, or furnishing a good grade of merchantable lump coal to be delivered at the three or more school buildings of Knoxville in such quantites that a reasonable supply will be on hand all the time. The successful bidder will be required to furnish a bond for $500. Address Secy. T. G. Gilson, Independent Dist., Knoxville, Iowa.

+1392—Anamosa, Iowa—Sealed bids will be received by Jones County for furnishing approximately 150 tons of Christopher 6-in. lump coal, to be delivered in October and November. Bids will also be received on 30 tons of anthracite range coal. Address County Audr. E. J. Hines, Anamosa, Iowa.

1393—Troy, Ohio—The Miami County Board of Commissioners will receive bids until 2 p.m., Sept. 15, for furnishing approximately 500 tons of 1½-in. screened lump coal, to be delivered at the boiler house on Water St., as may be required, during the period ending Aug. 1 of next year. Bids will also be received for furnishing 500 tons of 1-in. screened lump coal, to be delivered in carload lots at the County Infirmary during the same period. All bidders must furnish a certified check for $50. Address County Audr. M. T. Staley, Miami County, Troy, Ohio.

1394—New Castle, Penn.—The County Government will receive bids until noon, Sept. 16, for furnishing coal as may be required at the Court House and County Jail during the coming season. Bids are requested on Pittsburgh 1¼-in. screened coal and deliveries are to be in such quantities as required. Address Clk. James R. Lamoree, County Comr., New Castle, Penn.

+1395—Pinckneyville, Ill.—The Board of Education, District No. 50, will receive bids until Sept. 10 for furnishing coal as may be required during the school year ending June 30, 1916. The successful bidder will be required to furnish a bond for $200. Address Clk. C. H. Roe, Jr., Pinckneyville, Ill.

1396—Beckley, W. Va.—The Board of Education at this place will receive bids for furnishing coal as may be required at the various schoolhouses during the ensuing year. Address Secy. M. R. Jennings, Bd. of Edu., Beckley, W. Va.

1397—Pomeroy, Ohio—The Salisbury Township Board of Education will receive bids until Sept. 11 for furnishing and delivering a good grade of clean lump coal to the various school districts, as follows: Subdistrict No. 1, Silver Run, 300 bu.; No. 2, Long Hollow, 150 bu.; No. 3, Bradbury, 450 bu.; No. 4, Laurel Cliff, 300 bu.; No. 5, Rock Springs, 300 bu.; No. 6, Bull Run, 150 bu.; No. 7 Hiland, 150 bu.; No. 8 Coal Valley, 150 bu.; No. 9 Jacobs, 150 bu.; No. 10 Midway, 150 bu.; No. 11, 150 bu.; No. 12, Bailey Run, 150 bu.; No. 13, Rose Hill, 300 bu.; No. 14, Long Hollow, 150 bu. Prices are to include cost of delivery, which is to be completed before Oct. 15. Address Clk. Leo J. Byrne, Salisbury Township Bd. of Edu., Pomeroy, Ohio.

+1398—Vandergrift, Penn.—The school district of Vandergrift received bids until Sept. 8 for furnishing carload lots of Pittsburgh nut coal or No. 1 coal from the local banks. Address Secy. W. A. Wiggins, Vandergrift School Dist., Vandergrift, Penn.

+1399—Lewiston, Idaho—The County Government will receive bids until 9 a.m., Sept. 13, for furnishing 40 tons of furnace coal, to be delivered at the Court House. Address Clk. R. N. Wright, Lewiston, Idaho.

+1400—Wellsburg, W. Va.—The Wellsburg Board of Education will receive bids until Sept. 14 for furnishing and delivering coal to the various school buildings during the ensuing year, as may be required. Address Secy. J. A. Gist, Bd. of Edu., Wellsburg, W. Va.

1401—New Orleans, La.—The Robert Werk Pressing Cloth Co. is in the market for its annual requirements of coal, aggregating about 300 tons of lump or mine-run. The coal is to be delivered direct to the company's factory. Address Robert Werk, the Robert Werk Co., 2519 St. Philip St., New Orleans, La.

1402—New Lexington, Ohio—The Board of Education at this place will receive bids until noon, Sept. 18, for furnishing from 120 to 160 tons of lump and mine-run coal to be delivered to the local school building during the coming school year. The successful bidder will be required to furnish a bond for $300. Address Clk. J. H. Cookson, Bd. of Edu., New Lexington, Ohio.

1403—Omaha, Neb.—The Board of Education at this place will receive bids until 2 p.m., Sept. 15, for furnishing approximately 8,200 tons of bituminous and 350 tons of anthracite range coal to be delivered to the various school buildings. Bids will also be received for delivery according to districts as provided in the specifications and f.o.b. track. In bituminous the specifications call for lump, nut, mill and slack coal. The specifications are made more elastic this year in order to enable dealers in different parts of the city to benefit by their proximity to the various schools, to bid. Address Secy. W. T. Bourke, fifth floor, City Hall, Omaha, Neb.

1404—New Orleans, La.—The New Orleans Cotton Exchange is said to be in the market for their winter's supply of coal. Address Chn. Chaffee, New Orleans Cotton Exchange, New Orleans, La.

1405—Baltimore, Md.—The Shawinnigan Electro Products Co. at this place are now in the market for the fuel supply for a new plant they are completing and expect to put in operation about Nov. 1. Approximately 6,000 tons of anthracite steam sizes will be required. Address Purchasing Agent, The Shawinigan Electro Products Co., Baltimore, Md.

1406—Ogden, Iowa—The Independent School District of this place received bids until 5 p.m., Sept. 10, for furnishing the best grade of lump and mine-run coal to be delivered in car load lots at the school buildings during the coming school year. Address Clerk, Bd. of Edu., Independent School Dist., Ogden, Iowa.

1407—Augusta, Ga.—The City Government received bids until 5 p.m., Sept. 7, for furnishing the coal required during the year beginning Oct. 1. Bids were requested on Jelico coal in half-ton, ton and carload lots, on blacksmith coal in half-ton and ton lots, on nut, egg and furnace coal in half-ton and ton lots and on carload lots of steam coal. Address Clk. Wm. Lyon Martin, Finance Com., City Council, Augusta, Ga.

1408—Antigo, Wis.—The Board of Education at this place received bids until Sept. 8 for furnishing and delivering 200 tons of Miller Creek and 200 tons of white ash coal as may be required during the ensuing year. Address Clk. A. F. Zimmerman, Bd. of Edu., Antigo, Wis.

1409—Philadelphia, Penn.—The Philadelphia County Prison will receive bids until Sept. 14 for furnishing 600 tons of anthracite buckwheat coal to be delivered during October, November and December. Address Philadelphia County Prison, 10th and Reed Sts., Philadelphia, Penn.

1410—Minneapolis, Minn.—The Board of Charities and Corrections will receive bids until 2 p.m., Sept. 14, for furnishing approximately 5,000 tons of Youghiogheny or other bituminous screenings for use at the Minneapolis City Hospital during the period ending Apr. 1. All bids must be accompanied by a certified check for 5% of the amount of the bids. Specifications are on file. Address Secy. Richard Tattersfield, Bd. of Charities and Corrections, City Hospital, Minneapolis, Minn.

1411—Youngstown, Ohio—The Public Service Department will receive bids until noon, Sept. 14, for furnishing approximately 800 tons of coal to be delivered in the basement of the new city hall. Specifications and blank forms may be had on application. All bids must be accompanied by a certified check for $200. Address Clk. H. C. Fox, Pub. Service, Youngstown, Ohio.

1412—Toulon, Ill.—Bids will be received until 10 a.m., Sept. 14, for furnishing the Stark County Poor House, Court House and jail with coal as may be required during the ensuing year. Address County Clk. W. E. Nixon, Stark County, Toulon, Ill.

+1413—Valentine, Neb.—Bids will be received by Cherry County until noon, Sept. 13, for furnishing three carloads of coal to be delivered in the basement of the Court House. Address County Clk. A. B. Green, Court House, Valentine, Neb.

1414—Granite City, Ill.—The Corn Products Refining Co. will contract some time about Sept. 20 for their fuel requirements until Apr. 1 of next year. About 35,000 tons of Illinois 1-in. and 2-in. screenings will be required. Address Pur. Agt. S. J. Petit, 213-217 Illinois St., Chicago, Ill.

+1415—New York, N. Y.—Sealed bids will be received until noon, Sept. 17, for furnishing approximately 3000 gross tons of buckwheat No. 1, for the Bellevue and Allied Hospitals. Address Central Purchasing Committee, Room 1226, Municipal Bldg., New York, N. Y.

+1416—Ely, Minn.—The Independent School District No. 12 will receive bids until 8 p.m., Sept 14, for supplying approximately 600 tons of bituminous coal during the next year. Address Secy. Arthur Toms, School Dist. No. 12, Ely, Minn.

Contracts Awarded

Note—Successful bidders are noted in **bold face** type.

1094—Fairfield, Iowa—This contract (p. 117), which provides for furnishing the Independent school district at this place with approximately 1,200 bu. of coal during the ensuing year, has been awarded to **S. A. Power.** Address Secy. J. W. Dole, Independent School Dist., Fairfield, Iowa.

+1097—Norwalk, Conn.—This contract (p. 157), which provides for furnishing Board of Education at this place with approximately 100 tons of anthracite and bituminous coal, has been awarded to **Harris & Gans.** Address Board of Education, Norwalk, Conn.

+1122—West New York, N. J.—This contract (p. 158), which provides for furnishing the Board of Education with 400 tons of pea and 200 tons of nut coal, has been awarded to the **Consumers Coal Co.,** at $4.14 per ton for pea, and $5.91 for nut. Address Board of Education, West New York, N. J

1123—Indianapolis, Ind.—This contract (p. 158), which provides for furnishing the Indiana State School for Deaf with approximately 4000 tons of 1¼-in. standard screenings or washed coal and about 40 tons of nut, has been awarded to **A. B. Meyer & Co.** at $1.39 per ton, for Indiana No. 4 Vein coal. Other bids on this business were: Vandalia Coal Co., Indiana No. 4 Vein, $1.45; Indian Creek Mining Co., Indiana No. 5 Vein, $1.35; A. B. Meyer & Co., Washed Nos. 3, 4, 5, $1.79; Vandalia Coal Co., Indiana 5 and 6 Vein, 1¼-in. $1.30. The Manhattan range coal from Ohio was bought at $4.05. Address, Secy. Richard O. Johnson, Bd. of Trustees, Indiana State School for Deaf, 42nd St. & Monon R.R., Indianapolis, Ind.

1126—Hattiesburg, Miss.—This contract (p. 157), which provides for furnishing the local school board with approximately 200 tons of high-grade coal, has been awarded to **Morrison & Co.,** Jackson, Miss., at $2.65 for No. 2 lump coal delivered. Address Supt. F. B. Woodley, 417 Walnut St., Hattiesburg, Miss.

+1127—Indianapolis, Ind.—This contract (p. 158), which provides for furnishing the local school board with coal requirements during the ensuing year, has been awarded to the **Indianapolis Coal Co.** on the following basis: Linton No. 4, $2.40; Pocahontas mine-run, $3.45; nut and slack, $1.80; Kanawha, $3.65. Address Bus. Dir. John F. Cleland, Bd. of Edu., Indianapolis, Ind.

+1137—Jefferson City, Mo.—This contract (p. 199), which provides for furnishing the Missouri State Penitentiary with approximately 25,000 tons of coal during the ensuing year, has been awarded to the **Big Muddy Coal & Iron Co.,** of St. Louis at $1.33 per ton at the mine or $3.03 per ton delivered at the penitentiary. The award was let on the following guaranteed analysis: Moisture 7½%; ash, 8%; B.t.u. 13,450. The cost per million B.t.u. amounted to 12.016c. Penalties will be exacted for variations in moisture, ash and heat value lower than the standard specified. While the price per ton is higher than last year, the cost figures out slightly lower upon the specification basis. There were five other bidders on the contract. Address Warden D. C. McClung, Missouri State Penitentiary, Jefferson City, Mo.

+1139—Marion, Ohio—This contract (p. 199), which provides for furnishing the local School Board with approximately 480 tons of Hocking Valley 3-in. forked coal, has been distributed equally among the **J. L. Price Co., G. W. Paddock** and **P. Malo,** all of whom bid $2.70 per ton. The quotations include cost delivered in bins at the school buildings. Address Clk. Jeanette L. Hutchinson, Marion City Bd. of Edu., Marion, Ohio.

1141—Princeton, Ill.—This contract (p. 199), which provides for furnishing the fuel requirements of the Court House and Jail, has been awarded to **C. A. Oman** at $2.98 per ton for Carterville 6-in. lump delivered at the buildings. Address County Clk. James Fletcher, Bd. of Supervisors, Princeton, Ill.

1142—Sprague, Wash.—This contract (p. 199), which provides for furnishing the local Bd. of Education with coal, has been awarded to the **Potlatch Lumber Co.,** at $5.25 per ton for 70 tons of washed steam and $7.25 per ton for 10 tons of nut coal. Address Clk. J. F. Hall, School Dist. No. 6, Sprague, Wash.

+1143—Spokane, Wash.—This contract (pp. 199, 283), which provides for furnishing the local Board of Education with coal for the two high schools, has been let to the **Johnson-Bungay Fuel Co.** and the **Hawkeye Fuel Co.** The former received the contract for furnishing the Lewis & Clark High School with 700 tons of Corbin steam coal at $4.60 per ton, and the latter will furnish the North Central High School with 500 tons of Greenhill steam coal at $4.95 per ton. Experiments are being conducted with a view to using coal in place of wood in some of the grammer schools. Address Secy. E. A. Thomas, Bd. of Edu., Spokane, Wash.

+No. 1144—Nelsonville, Ohio—This contract (p. 199), which provides for furnishing the local Board of Education with mine-run coal, has been awarded to **J. M. Lama** at $1.07 per ton. Other bids on the contract were Alonzo Coakley, $1.12; John Wion, $1.11; Charles McClurg, $1.18; Thomas Shelton, $1.35; Bennett & Perry, $1.10; Aaron Green, $1.14; Wm. Coakley, $1.14. Address Clk. E. B. Beard, City Bd. of Edu., Nelsonville, Ohio.

COAL AGE

Vol. 8 NEW YORK, SEPTEMBER 18, 1915 No. 12

Convincing the Boss

Money Talks

A WELL-KNOWN American power engineer has succeeded in his profession because of his ability to quickly convince his superiors that he is right. He finds that the best way to convince is to talk in terms of the almighty dollar. When he says to the owner, “You are actually burning up every day in those furnaces a ten-dollar bill that could as well be saved,” the owner feels in his pocket for the escaped ten-spot. The engineer soon gets the stokers he wants.

He wants to increase the size of the plant and thereby advance his salary, so he says to the owner, “I'll work for you for nothing next year if you will give me your exhaust steam.” The owner's interest is again aroused, the exhaust steam is made to do good work, and the owner saves MORE than the engineer's salary.

“It's strange, isn't it,” he remarked one day as the owner was on an excursion through the plant, “that our oil costs more after we have used it than it costs to buy it.” The owner was stumped. He had never heard of such a thing, so he asked for an explanation. The engineer did himself proud in explaining the nuisance of oil in boilers. The filter he wanted was therefore quickly installed.

He always attacks his needs in an original way. He takes the owner by surprise whenever he can, so as to get due consideration. When he wanted a feed-water heater he said, “I need another helper. Can I have one? He won't cost anything.” This opened the way to his carefully planned argument. The feed-water heater was installed.

Owners, managers, superintendents and bosses are all human beings and they enjoy a change in method of attack. Don't hammer away for what you want in the same way all the time.

Money talks, so why not give it a chance to be heard?

Written for Power by W. F. SCHAPHORST, *New York City*

Correct Tipple Design--I

By M. L. Hyde*

SYNOPSIS—This is the first of two articles on this subject. It sets forth what a tipple should be and what it must be able to do in order to fulfill to the highest degree the function for which it was built.

Between satisfied custom and efficient mining comes the correctly designed tipple as a connecting link, meeting the demands of each. Such a tipple must satisfy the desire of the sales department for proper grading combined with proper loading and careful cleaning—and of the operating department for moderate first cost combined with economical operation.

No matter how high the coal in quality, no matter how well mined, unless the demands of the consumer are complied with, failure results.

The elasticity of a tipple, in order to grade and mix various sizes, must therefore be unlimited. Its ability to load anything the railroad supplies, from a "battleship" to an automobile box car, must also be unlimited; and this loading must be accomplished with a minimum amount of resultant slack. The equipment for picking must be complete in every particular, even though at the time of building there is every indication that the coal to be handled will reach the tipple clean. It is false economy to omit machinery for performing this work, as a clean seam today may be a dirty one tomorrow.

If one stops to think of the strides made in automatic stokers, heaters, furnaces, gas producers, ranges, etc., during the past few years, he will readily appreciate the necessity for unlimited elasticity in every department of the tipple if he wishes to keep pace with the consumer's ingenuity in thinking up new requirements to be met. The tipple, to conquer these problems for the next 30 or 40 years, must indeed be almost human, and a shorter life is not commensurate with the investment.

Among the general features essential to a tipple are the ability to make as many grades, and any mixture thereof, as the market to be catered to may call for; to handle each of these grades over the shortest distances possible without drop or change in direction; to handle first the lump, then the egg, then the nut, etc., each in proportion to its market value, over the gentlest course, allowing for lip screening of the large grades and for mechanical loading where the capacity required is such as to necessitate it; to allow of cracking the lump to any given smaller size, with a minimum loss in fines (this being a condition coming more and more to the front owing to the antagonism of the buyer to large lumps, which is only reasonable, and therefore it is safe to predict that the near future will see lump a drug on the market, with a heavy demand for a 6- or 7-in. cobble); to handle rock from the mine car without allowing it to come in contact with any of the coal handling machinery; to handle local coal without the expense of cleaning; to furnish slack, or nut and slack, to the boiler-room; to furnish any combination of grades for locomotive coaling purposes, rescreening, washing, for coke ovens or for auxiliary outside storage to be held for boiler or local purposes in case of a shutdown; to allow of removing waste from the tables, spilled coal about the cars and dirt shoveled from them with the least possible cost and the least complication of equipment; to allow of spotting and loading cars regardless of weather or other conditions. The tipple should, furthermore, have a mechanical equipment low in power consumption and so constructed that repairs and replacements can be made by the local force. Finally it should be moderate in first cost and low in operation and upkeep expense.

We will first take the details of all equipment making up the complete unit, the reasons for their being given preference, and then describe a tipple embodying them.

Good Type of Headframe

About four years ago the Allen & Garcia Co., of Chicago, put on the market a patented headframe having two main columns placed in the middle of the shaft curbing and at either end just back of the guides, these members being carried by brackets from the columns. The center guides were carried by a central column hung from the main structure so as not to rest on the shaft timbers.

When adapted to an end hoist tower the sheaves are carried directly on an A-frame of the same width as the columns, the forward leg of which is carried down to the ground outside of a resultant of the cable stress. This construction affords a rigid tower, easily erected and maintained, and costing but little more than half as much as the standard six-leg frame. It should be furnished complete with landing dogs at the surface, gates at all landings, ropes and their fittings, and three sheaves (an extra one being carried in case of emergency). Arrangements should also be made for replacing without serious inconvenience a broken sheave and for taking off the ropes and replacing them when such renewal is necessary.

Mines having a capacity not exceeding 600 tons, where the topman also acts as lampman, can handle the men to and from the mine to best advantage by having the landing stage for men at the same elevation as the topman's office in the tipple. With this arrangement the topman gives out all lamps at the lamp house and then goes to his office and handles the signals for lowering the men. Each miner, before getting on the cage, hangs his check on the check-board placed on the side of the topman's office.

On leaving the cage at the end of the shift he removes his check and hooks it on the lamp, the numbers of both corresponding; he then returns the lamp to the lamp house. If he fails to hook his check on his lamp he cannot get the lamp in the morning. This forces him to remove his check from the board, which affords an accurate record of the men in the mine at any time.

The car tally-board is also located in the topman's house, so that each loader can ascertain at the end of the shift just what his credits for the day are. The topman does not have to leave his office except to send

---

*Pembina Coal Operators, Ltd., Evansburgh, Alta., Canada.

down supplies, and no one can get in the mine without his permission.

Mines having a capacity of more than 600 tons and using a separate lampman and surface cager can lower the men from the ground level to better advantage than from the upper landing, though the same tally system is recommended.

Main Structure

There is no excuse for a tipple not having clean-cut, uniform lines. It should be in harmony with the rest of the plant units, pleasing to the eye and an ornament to the plant as a whole. A tipple covered with bumps and humps, two or three stories high, is no credit to either designer or owner and since it is the highest structure about the mine, its abnormality ruins all possibility of harmony and beauty in the general layout. Moreover, all these bumps cost money.

A low building, with easy stream-line design, costs less, looks better, is easier repainted, re-sided, reroofed and protected from fire than any other type; and having a low center of gravity, the live loads from screens, etc., are easy on both structure and foundations.

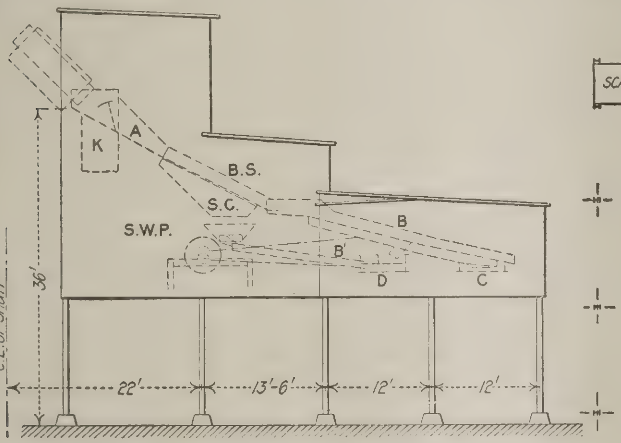

FIG. 1. AN ARRANGEMENT ALLOWING GENTLE HANDLING OF LUMP

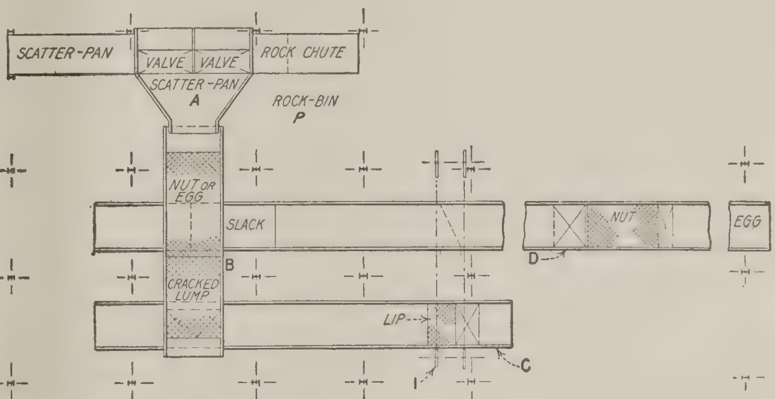

FIG. 2. GENERAL PLAN OF A TIPPLE, ILLUSTRATING CLEARANCES

All-steel construction is recommended, with columns of 8-in. H-sections and flooring of standard 10-in. I-beams covered with ¼-in. checkered plates. The roof should be of Hy-rib and concrete plaster 2 in. thick, set on 4-in. I-beams and whitewashed on the under side for light. Siding should be of 20-gage American ingot corrugated iron, or its equal. The whole structure should be painted with two coats of graphite, with a slate-gray body and black trimming. Foundations should set 24 in. above the ground, the latter being carefully leveled and ditched.

Wire-ribbed glass skylights should bear direct on every machine, and the picking-room roof should be so fitted for its entire length.

Heating coils must be furnished for the topman's office and the picking room. The latter room should be arranged with sliding shutters in the side walls for ventilation during hot weather. The entire structure should be well lighted with electricity, especially between the tracks and in the picking room, where the lamps should be mounted in an inverted white enameled trough set 36 in. over the tables, with lamps on 4-ft. centers.

Trap doors should be placed in the floor of the picking room to permit the removal of sweepings. This room should be partitioned off from the rest of the building, and should be free of windows. There is no way to keep the picker boys from skylarking when the cat's away, which often results in broken windows or a boy being hurt. If they are shut off from all machinery the latter cannot easily happen.

With the building designed along the lines suggested, roof trusses, kneebraces and latticed members of all sorts are unnecessary. There is no place for coal dust to accumulate, and the roof presents a smooth inner surface, which a coat of whitewash applied now and then keeps clean, light and cheerful.

Both speaking tubes and electric bells should connect the picking room to the topman's office. Telephones and pneumatic signals should connect the topman's office with the surface landing, mine, mine manager's office and hoist engine room. This office should have a desk on which to make out car sheets, records, etc.

Below the tipple, at the ground level, the tipple foreman should have an office with a desk, where bills of lading can be filled in and tipple time books, car seals, etc., kept. Located here should be locked tool-boxes, containing the tools necessary for making ordinary repairs, as well as car pinchers, shovels for cleaning up and other equipment required in the day's work, all marked with the department number of the tipple.

Waste Bins Should Be Under the Floor

Waste bins for intermediate storage of refuse from picking tables should set directly under the floor of the picking room. This obviates the installation of conveying machinery to handle gritty substances. These bins are the only ones recommended to be put under the tipple; all others should be well removed from it. Waste from the tables is not subject to spontaneous combustion and therefore not dangerous; nor do the bins required to hold it increase the height of the structure; whereas if the screens were set over small coal bins, not only would the element of danger be introduced, but the tipple height would necessarily be increased, with the extra drop to all the better grades that must pass over the bins on their way to the cars.

It will be found cheaper and more satisfactory to locate all storage bins away from the tipple. These bins should be cylindrical, with conical bottoms and lined throughout with cement, if the maximum tonnage with maximum safety and cleanliness is to be obtained for the smallest first cost.

The tipple building should be so designed that neither wagons nor carts will ever have to go under it. These cut up the ground and as a result of spillage are dirty. Furthermore, underneath a tipple is no place for a horse.

As part of the complete tipple a 50-ton empty track scale and a 125-ton loaded track scale for railway cars should be included, also a platform located at the empty scale for storing coal doors for box-cars. These, or the materials for making them, are usually furnished by the railroads in car lots, and it saves much time if a platform is furnished upon which they may be conveniently stored.

Coal-Handling Equipment in Detail

Self-dumping cages with rollers at top of dumping platform are recommended. With this design greater leverage, and consequently a reduced stress on both cage and headframe, are secured. The cages should be designed to allow the car to project beyond the ends of the cage, so that in the dumped position the car would be lifted a minimum distance above the receiving hopper, insuring no drop and no spilling of the car's contents down the shaft.

The guide irons should be so curved that during the dumping period the car is rapidly dropped to the emptying position and while discharging is moved slowly. Horns are preferable to drop-rails for holding cars on the cage. Double bridle chains should be used on every cage in which it is intended to handle men.

There are many advocates of the platform cage with automatic pushers for removing cars therefrom, after which they go to a rotary or cross-over dump. The first cost, as well as the operating expense of a tipple so designed, far exceeds that of one with a self-dumping cage. Its capacity is less, and even with rotary dumps there is absolutely no saving in breakage over a properly designed self-dumping equipment. Some mines produce a dusty coal, and cars fitted with end doors are objected to on account of leakage along haulage roads. An all-steel car can easily be built with end door to obviate this difficulty, and the first cost is but a few dollars higher than that of the solid-box car.

Receiving Hopper

The receiving hopper, often called the scatter pan, especially in tipples using bar screens, should be built with ¼-in. steel sides and $\frac{5}{16}$-in. steel bottom plates, with an angle of 28 deg. along the bottom. It should have sides extending straight for a distance sufficient to allow of placing hinged valves in its bottom, through which rock or local coal can be diverted without going over the tipple machinery proper. These valves should be counterweighted and operated by levers in the topman's office. From the valve the hopper sides should converge to a discharge opening approximately 5 ft. wide. It is not good practice to make this a storage hopper; in fact it should be as short as possible, being the only place in the tipple where the coal is allowed to flow by gravity, and consequently with some slight damage. The hopper bottom should ease off to a level discharge before the coal leaves it, thereby retarding the flow decidedly.

From the receiving hopper the coal should pass either to a bar screen (if the screened lump basis is in force), to a weigh pan direct, or to a preliminary shaker, if a run-of-mine basis is employed, the car being weighed in the latter case on platform scales before dumping.

Weigh pans for lump or run-of-mine coal are objectable. Throwing the entire contents of the mine car into the pan in a mass, and then dropping it out again in a mass, results in unreasonable breakage. Considerable extra height is required for the tipple, and all in all the practice has little to recommend it.

Fig. 1 shows an efficient way of overcoming this vicious handling of the lump when the coal is friable, though requiring a little more office work. The coal passes from the receiving hopper to the bar screen *BS*, the lump going direct to the shaker *B*, and the fines falling to the chute *SC*, thence to the weigh pan *SWP*, where it is weighed and discharged to the screen *B*.

It is assumed that with this system steel mine cars of uniform weight are used. These are weighed loaded, on platform scales set to balance the empty car, thus recording the net weight of the car's contents, from which at the end of the day the weight of the slack is subtracted, leaving the weight of lump for which each loader is to be credited.

This gives an accurate record of every pound of coal leaving the mine and allows of the easiest possible handling of the lump and egg. It requires an extra weighman and extra work in the office, which is more than counterbalanced by the saving in lump and the correctness of the records. With a hard coal this would prove an unnecessary refinement.

Bar screens are always of a standard adopted by the locality in which they are used.

Weigh Pan Should Be Substantial

The weigh pan should be of substantial design, with ¼-in. sides and $\frac{5}{16}$-in. bottom, and should be suspended from the tipple scales (which should be of at least six times the capacity of the work for which they are required), equipped with quick reading dial. The pan should receive the mass of coal and bring it to a standstill as quickly, yet as easily, as possible, and should discharge it in the same way.

On being discharged from the receiving hopper or weigh pan, a preliminary shaker is recommended. This serves the purpose of feeder to the picking tables and of a coarse separator as well. It handles the coal gently and without drop, makes a thorough separation of the lump from the smaller sizes and is low in first cost.

For capacities up to 1,500 tons per day a screen 6 ft. wide is ample, and for capacities up to 3,000 tons an 8-ft. screen is sufficient. If the egg, nut and slack are sent to one table, three 3-ft. sections of egg perforations will be required, and four sections of nut perforations if the nut and slack go to one table. This should be the extreme length of screen plate installed, additional capacity being gained through additional width. This is because of needless attrition when the coal is jigged over an unnecessary length of perforated plates. With the length of perforations suggested nothing will be gained by introducing a feeder before the screen.

One-quarter-inch side plates and $\frac{5}{16}$-in. bottom plates should be used in the screen construction. Perforated plates should be bolted on with lock-washer bolts, and extra plates of different sized perforations should be carried in stock on the tipple floor ready for use.

The path of the coal over this screen should be as follows: The egg, nut and slack falling through to the lower deck pass direct to the small-coal picking table. The lump going over the egg screen reaches the 6- or 7-in. cobble perforations, the undersize going to the lump table and the oversize, or large lumps, going to a cracker. In case it is desired to load lump direct, the cobble screen plate is removed and this coal all sent to the lump table.

This screen is driven through connecting rods from an eccentric shaft carried on an independent steel framework, the shaft in turn being driven by belting from a 20-hp. motor. The screen should be suspended by four hanger rods, should set at an angle of 14 deg. for the egg screen and 12 deg. for the cobble screen. A speed of 90 r.p.m. will give best results, and no trouble need be feared from undue vibration.

Traveling Picking Tables

Manufacturers mostly recommend conveyors of either the apron or drag type, preferably the former, claiming less attrition and a more uniform spread to the ribbon of coal on the table. Neither of these advantages shows up well enough in actual practice to warrant its consideration in preference to the horizontal shaking type of table used for the past decade in Great Britain in many of the best-designed tipples which it has been the writer's pleasure to study.

The apron conveyor consists of two strands of roller chain, carrying plates or trays of steel from 3 to 5 ft. wide between them. They can only be used as picking tables when carrying material on the top strand. They are excessively heavy in weight and high in first cost. Expensive structures are required for their support because of the weight and height necessary. The chains require continual oiling from one end of the conveyor to the other, as well as all machinery at both head and foot.

Fine wet coal causes considerable trouble on this type of conveyor, particularly in cold weather, as it gets between the overlapping edges of the plates and freezes them together during the night shutdown, putting a tremendous stress, often accompanied with serious results, on the whole mechanism when starting up in the morning. The only remedy for this is the placing of steam coils under the whole length of the carrying strand, in which steam must be carried night and day during a cold spell.

With dry, fine coal the apron is dirty, for fines leak between the plates and fall to the bottom strand, where they are rolled around until a sufficient accumulation warrants shoveling them away. Owing to the chains being on the outside edges of the carrying plates, guards are required over them to protect the arms of the pickers. These guards take up about 12 in., and force the boys to stand that much farther from the coal to be handled, making a decidedly uncomfortable reach to the center of a 5-ft. table, often to the neglect of dirty coal traveling there.

Most serious of all drawbacks to this table is its inelasticity when mixing two or more sizes. Where this is done the mixture should always be made by taking the already picked grades from their given tables and transferring them to the table carrying the largest size of the desired mixture. If this method is pursued all coal flows in one direction, over one chute to the car to be loaded. It reaches the car nicely mixed and fully lip-screened. This method also allows of the most gentle discharge. Where the different tables discharge their various grades to gathering chutes leading to a common car-loading chute, all these advantages are sacrificed.

As the apron has but one point of discharge, namely, its head, all grades must be carried to that end and there delivered to gathering chutes. This can be accomplished with open cars, but not with both open and box-cars. The mixture is made directly over the car at a point where it is hard to dispose of lip-screenings. The mixing chutes must necessarily be long, and those for the small grades steep, increasing the height and cost of the entire structure, as well as introducing breakage at the critical point.

⁂

The Indiana Situation

A number of new coal-mining companies are projected for operation this fall and winter in Indiana, but owing to the unsatisfactory state of trade, plans for their consummation are not progressing as rapidly as was expected. Those interested in these new ventures are now giving much thought to the future outlook.

Former State Mine Inspector Pearce a few weeks ago took occasion in an interview to show the hazards of the coal business as now conducted in the state of Indiana. Among other things, he said that in 1910 there were 182 mines operating in the state, employing 31,171 persons; whereas at the present time there are only 126 mines, employing 20,518 persons. He emphasized the fact that the production of coal has reached a deplorable state, and if continued will drive more operators into bankruptcy. The present situation not only results in waste of coal but destroys life and property, and makes idle each year hundreds of additional employees, until at last conditions have well-nigh become intolerable.

Mr. Pearce thinks that the Federal Government, as well as the officials of Indiana, should take cognizance of the evils of overproduction, which result in ruinous competition and waste of the coal resources of the state.

The more prominent operators are endeavoring to prevent ruinous competition in marketing their product, but have so far found little encouragement from either the Federal or state authorities in following such a course.

What is to happen to the coal producers in this state in the matter of marketing their production at profitable prices is a problem. It is a certainty that they will never be able to obtain better prices until they act more in coöperation, and it is just as evident that the spirit of cynicism, distrust and suspicion must be replaced by cohesion before better times are possible. The Indiana trade needs more than anything else a leader. There are men engaged in the state's coal industry qualified to lead and whom a great majority of the shippers and producers would follow. The commercial, financial and manufacturing world is replete with associations now doing effective work for their respective lines of business in this country, and when one looks into the demoralization and bankruptcies of the coal-producing industry of the Middle Western states it seems to show lack of leadership and a state of incapacity which is little less than criminal.

Deaths from Explosives and from Electricity

In a recent monthly statement of the United States Bureau of Mines compiled by Albert H. Fay is given an interesting table, here quoted, showing the conditions under which explosives and electricity caused death. The table that relates to explosives shows that 18 per cent. of the accidents occur during the handling and transportation of the explosives and approximately 25 per cent. may be grouped as due to premature blasts and short fuses.

It will be noted that comparatively few fatalities at coal mines are caused by the thawing of explosives and still fewer are due to unexploded charges in coal and débris. The total number of fatalities owing to shots breaking through the pillar between working places is 220, or 6.01 per cent., which shows how important is this matter.

CLASSIFICATION OF COAL-MINING CONDITIONS WHICH LEAD TO FATALITIES IN WHICH EXPLOSIVES CAUSED DEATH

State	Period	Handling and Transportation	Handling Caps, Detonators, Squibs, and Fuse	Thawing Explosives	Tamping	Premature Blasts and Short Fuse	Blown Out or Windy Shot	Flying Pieces of Rock or Coal	Returning Too Soon	Blast Delayed	Shot Breaking Through Pillar	Suffocation by Powder Gas	Striking Unexploded Charge in Removing Debris	Drilling into Unexploded Charge	Miscellaneous	Total

The first dates in the table classifying electricity accidents are not those of the introduction of electricity into the mine, but are the dates when the first recorded accident from electricity occurred. The descriptions of the accidents in inspector's reports are in some cases not sufficiently clear. For this reason the "miscellaneous" list is somewhat large and constitutes 17.29 per cent. of the whole. Contact with machine feed wire and walking or falling against trolley wires are the leading sources of accident. Contacts with feed wires caused 126 deaths, while 361 men died from touching trolley wires.

CLASSIFICATION OF FATALITIES IN AND AROUND COAL MINES, CAUSED BY ELECTRICITY, SINCE ITS INTRODUCTION INTO THE MINES, BY STATES, SHOWING PERIOD COVERED

State	Period	Direct Contact with Trolley Wire							Tool or Iron Bar Striking Trolley Wire	Contact with Mining Machine	Contact with Machine Feed Wire	Contact with Haulage Locomotive	While Repairing Line Wires	Miscellaneous Electrical Causes	Total
		While Climbing on Car or Motor	While Riding Car or Motor	While Replacing Trolley Pole	Falling or Walking Against Wire	Stepping on Fallen Wire	Repairing Guard Boards	Other Trolley Wire Cont'ts

Of course some of the causes overlap slightly. For instance, "Returning too soon," "Flying pieces of rock or coal," "Blast delayed" and "Suffocation by powder gas" might generally be classed under the first head. In compiling the table the statement of the inspector has been taken as establishing the preferable classification.

Coal Mining at the Panama-Pacific Exposition

Special Correspondence

SYNOPSIS—There are a number of interesting and instructive exhibits arranged by various coal companies and machinery manufacturers. Moving pictures play an important part in the educational work.

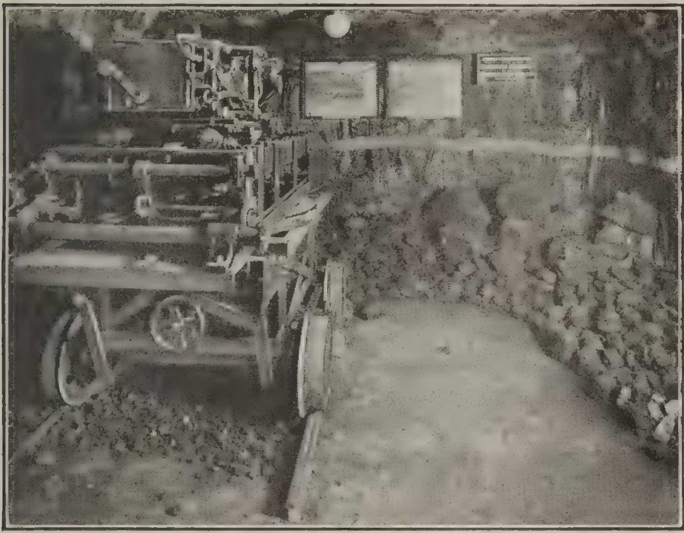
A person whose primary interest is coal mining might naturally assume that in an exposition located on the Pacific Coast and so near the stirring scenes of '49 there would be little of interest to a coal man and pertinent to the coal industry. Such, however, is far from the case, and no place on the entire exposition grounds attracts more interest or has a greater number of visitors than The Mine, which was illustrated and briefly described in a recent issue of *Coal Age*. This exhibit alone is worthy of a more extended notice, and moreover coal mining is shown not only in The Mine but in a number of other interesting ways.

The Mining and Metallurgical Building covers an area of 172,555 sq.ft., is located directly on the Marina, overlooking San Francisco Bay, and its north portico is one of the most advantageous locations from which to view the daily flights of the airships. The building contains not only mining exhibits, but also such allied displays as those of the United States Geological Survey and the United States Mint. There are also other Federal exhibits, such as the model post office of the United States Post Office Department.

Exhibits Are Practical and Educational

The exhibits in the mining building are essentially educational in character, and there is a pleasing absence of mere piles of ore, rock and coal that so often make an exposition seem little more than a glorified stone quarry or coal yard. Seldom is it possible to see side by side in close and striking contrast and upon a full-sized scale coal-mining methods as carried on in West Virginia, Kentucky, the anthracite region of Pennsylvania, the Rocky Mountain coal fields and the mines of the Pacific Coast.

An interesting exhibit is that of the Consolidation Coal Co. in the Elkhorn coal field of Jenkins, Ky. The mine represented produces gas coal and an excellent byproduct coking coal that is of particular interest at the present time owing to the shortage of coal-tar products. A Jeffrey-Drennan turret coal cutter is shown cutting in a band half way up the coal section. Although the ribs are of painted canvas, the effect is realistic, the realism being enhanced by the piles of coal about the face and ribs and by the turret cutter and a portable electric pump exhibited at the rear of the coal cutter by the Fairmont Mining Machinery Co. A shortwall Jeffrey coal cutter forms part of the exhibit of the Pocohontas Consolidated Collieries Co. in room 11.



CONSOLIDATION COAL CO.'S EXHIBIT, SHOWING TYPICAL ROOM IN ONE OF ITS ELKHORN, KY., MINES

EXHIBIT OF THE HERCULES POWDER CO., SHOWING MODEL OF A BLACK-POWDER MILL

Another exhibit shows the method of mining in a pitching seam as carried on by the Pacific Coast Coal Co., of Seattle, Wash. The face is reached through an inclined chute, which is steep and low, so that only those visitors will see the actual working conditions who are willing to climb up the chute at some personal inconvenience. The realistic reproduction in The Mine of underground conditions is shown very well in an exhibit of a Baldwin-Westinghouse electric locomotive hauling a car along the mine entry.

Mine-safety devices, safety lamps and electric danger signals are shown in The Mine by the Life-Saving Devices Co., the Concordia Safety Lamp Co., the Mine Safety Appliances Co. and the Baldwin Carbide Lamp Co. Some of these companies also have exhibits on the main floor over The Mine, where are also shown oxygen-breathing rescue apparatus of the Draeger, Fleuss and Westfalia types. The realism of the mine is carried out by the use of safety lamps in many places, and many visitors are provided with them as they enter the mine. Many of the guides are dressed as miners, and as The Mine is in made ground and below the water level of the bay there is a very distinctive mine odor.

The Bureau of Mines shows in a case an excellent exhibit of safety lamps and other lighting devices, and by means of a working model the dust-distributing device of George S. Rice, chief mining engineer of the Bureau.

Moving Pictures Much in Evidence

One of the most striking advances to be noted in the Panama-Pacific Exposition is the extensive use of moving pictures, mainly as an educational feature, with the advertising feature absent or only very incidental. In the Palace of Mines three moving-picture shows are in almost constant operation. One of these in The Mine shows scenes from practical mining and quarry work, another on the main floor shows general technical and geological films, while in still another in the other end of the building and forming part of the exhibit of the United States Steel Corporation are shown many phases of the mining of coal and iron ore, the coking of coal and the manufacture and fabrication of iron and steel.

One of the novel features of the mining exhibit is the White ambulance and rescue truck of the Bureau of Mines. This is equipped with oxygen-breathing apparatus, first-aid supplies and other rescue appliances, and twice each day, at 11 a.m. and 2 p.m., it is brought into use as a part of a rescue and first-aid demonstration. At these hours a loud report is heard and smoke issues from The Mine, whereupon the rescue truck and corps dash up to the north entrance of the building, the rescue men don their apparatus and the corps enters The Mine and soon returns with the supposed victim, who is placed on a raised platform and first aid given to him. This demonstration never fails to attract a crowd.

The Consolidation Coal Co., in addition to its display in The Mine, has an excellent exhibit of photographs and charts near the south entrance to the mining building, and in this same space are shown some very large blocks of coal that must have been extremely difficult to mine and transport to San Francisco.

The United States Steel Corporation coal-mining interests are represented by numerous photographs of the H. C. Frick Coke Co., the Bunsen Coal Co., and the National Mining Co. Samples of coal from various districts are also shown. A most interesting model shows a complete modern coal-and-coke plant, $\frac{1}{16}$ of full size, having a capacity of from 1,200 to 1,300 tons of coke per day. The headframe and coal bin are of steel all foundations and the shaft lining of concrete, and the subsidiary buildings, such as boiler, engine, oil, supply lamp and other houses and shops, are all substantially constructed with galvanized corrugated roofs. A hot-gas flue conducts the oven gases to the boilers. The ovens are mechanically operated. In this model, which was awarded a "Medal of Honor," great prominence is naturally given to the many uses of steel and concrete in a modern coal mine. All mine cars are of steel, with steel wheels, and in The Mine the shaft bottom and all pump rooms, stables, mine offices, engine rooms, first-aid rooms, air bridges, overcasts, etc., are of either steel or concrete. Steel mine timbers and ties are also much in evidence. The transportation of coal and ore is illustrated by many photographs and models of lake carriers. One of the most attractive exhibits in the mining building is that of the Hercules Powder Co. It includes the ingredients and finished products for a number of different explosives, a working model of a black-powder mill, the methods of testing detonators, a magazine, and the methods of using explosives, the whole forming an unusually complete and instructive exhibit. This company also has a magazine in The Mine.

Exhibits Covering Welfare Work

In view of the great advance made along sociological lines in connection with mining since the St. Louis Exposition, one naturally looks for prominent welfare exhibits. The Bureau of Mines has displayed a number of photographs and a diagram of a model mining village, with the principal welfare points prominently brought out. In the United States Steel exhibit a large section is devoted to the welfare work as carried on by the various subsidiary companies comprising the corporation. No special prominence is given to the mining part of the work, but large numbers of photographs and a few models illustrate the safety-first campaign.

SHOWING A BALDWIN-WESTINGHOUSE ELECTRIC LOCOMOTIVE HAULING LOADED CAR ALONG ENTRY

The methods used to impress the necessity of "safety first" are illustrated by photographs, transparencies and tabulated data. The several phases illustrated are first-aid crews, rescue crews, rescue cars, emergency-dressing stations and hospitals. The subject of sanitation is also taken up and typical bath and change houses, sanitary drinking fountains, modern houses, etc., are shown. Model gardens and mining towns are likewise shown, also the work of district nurses, children's playgrounds, club houses, etc. In fact every feature of mining and metallurgical sociology is well illustrated.

⁂

In Some Mines the proposal to institute extensive watering of the roadways to counteract the influence of coal dust directs attention to the question of miner's worm disease. The removal of one danger by such means it is feared may introduce another evil, especially in deep warm mines. It may be that miner's disease is not likely to spread extensively in pits where the temperature can be kept below 64 degrees, also that it cannot exist in very dry pits; but the experience in Germany is to the effect that it spreads rapidly after the system of watering the dust to prevent dust explosions is introduced. Investigation has shown conclusively that the danger from the worm is greatest in warm and moist pits, and the effects of watering must be more closely watched when so much of the coal is being extracted from great depths.

Supervision of Mining Details

By G. S. Brackett*

SYNOPSIS—Mine operation as usually practiced requires the performance of much dead work or work which does not directly contribute to production. If the "floating gang" could be eliminated, either wholly or in part, and necessary repairs carried out under the direct supervision of the foreman, expenses might be decidedly reduced.

Suppose you could lift the cover off your mine and watch each detail of the production of coal and each movement of your employees from starting time until evening. Suppose that you could give the same supervision over your employees that exists in a department store or a factory. There is no doubt that your cost of production would be less; but our efforts along this line can only be approximations. These methods can, however, be approached as closely as possible, but we face the danger of paying more for bosses than is harvested in results.

A well-managed and well-equipped factory has practically every effort directed in the production of the finished product, ready for shipment, and every employee is under almost constant supervision, with their labors computed from a time clock. Repairs are mostly done by laying a piece of machinery idle, and every extra piece of work outside the actual production has the careful attention of the management as to its estimated cost and most opportune time of accomplishment.

Many mine employees work by the hour, and the only guarantee of their productive ability or efficiency is the foreman's judgment, from time to time, of the amount of work accomplished. Even if the foreman is an excellent judge, a certain period of time has passed and some labor has been wasted before further loss is eliminated. This time is probably considerable, as a careful foreman wants to be sure he is not unjust. The actual loss is never recovered.

Payroll Costs

The payroll costs at a mine may be divided into the following four general heads, subject to any subdivisions each management desires:

A. The cost of management, office and supervision at the mine, including all expenses which continue regardless of the production. Under this head come pumpmen, stable men, bosses, firebosses, electrician, and in many cases the power house.

B. The cost of mining the coal and placing it on board the mine car at the working face.

C. The cost of transporting the coal from the face and loading onto the railroad car, including drivers, trappers, dumpers, trimmers, motormen and brakemen, but only those who are directly connected with the movement and handling of the coal.

D. The cost of all other labor (such items as may be dispensed with, even if only for a short time, without interrupting the movement of the coal)—trackmen, timber men, road cleaners, brattice men, ditchers, electrician's help, etc.

Eliminate the last division (D) and dispense with all employees classed therein—what would happen first and what would be the ultimate result? Every superintendent has his own problems and his own opinions, and the answer would be different in many cases. The following order of events may serve to approximate the happenings in some mines:

1. One miner goes home for the want of a crosscut turn or switch.
2. Another cannot work because of a fall in his working place.
3. The lack of a brattice on one of the headings prevents its working.
4. A bad piece of roof along the heading cannot be timbered.
5. A loaded car off the track and nobody to help replace it.
6. Mining machine broken, pump grounded, motor armature burned out—no electrical help.
7. Headings gobbed, ditches choked and men quitting.

There is no economical argument in favor of permitting a mining plant to depreciate. To be efficient it must be in good repair in every respect. This article is a plea for better mining conditions at the same cost, which may be interpreted as meaning the same conditions at a less cost.

All the aforementioned difficulties and more are being met daily in different parts of many mines, and in many cases the work cannot be done promptly. Why not consider almost every item much on the same principle as we would the renewal of a pipe line some time next month or the month after, at an opportune moment when the work may be done economically—the same as the repair of a certain piece of machinery in a factory or the changing of a counter in a department store?

There would have to be an idle working place or two kept in condition for the use of miners who for some reason or other are unable to work in their own places. The idea is to get this class of work, or as much of it as is possible, done at a time when the mine foreman or his assistant can be there to see it properly completed, by some miner picked from that immediate section, allowing him the actual time consumed in the work or the estimated cost thereof.

There are many miners who would be glad of these extra earnings made between driver's trips or while waiting for the mining machine, without interrupting their regular duties. The individual, aside from his work at the face, has the means of increasing his income.

The same policy may be applied to most of the other happenings. It will be cheaper to pay some of the miners their just earnings for helping put a car on the track than it will be to bring the track or timber gang there for that purpose, and there is not nearly so much lost motion in its accomplishment. An extra mining machine, an extra portable pump and some spare armatures relieve more of the difficulties. Can you imagine the comfort and security the superintendent, foreman and electrician would feel in the fact that there was duplicate equipment on the job to meet the majority of emergencies? Under

---

*Engineer of Mines, Flemington, W. Va.

such conditions the work could be done more efficiently and at a less cost.

If you do much writing you will probably have several pencils, all sharpened, so that when one becomes dull you can promptly pick up another. When you have a little time you sharpen them all or all that need sharpening. Your mine men have to repair their equipment (sharpen their pencils) after work hours or hurriedly during the operation of the mine in order to lessen the delays as much as possible. They work under difficulties, interruptedly, and your force has to be greater to meet emergencies. There is no legitimate reason why a great deal of this class of work cannot be done under favorable conditions and at an opportune time, properly and carefully.

A Record of Work Accomplished

Examine your day force critically—every one not directly connected with the movement of the coal. What are they doing and what percentage of their time is actually consumed in their work? The foreman will tell you they cleaned up a fall on a heading, put a turn in a crosscut, fixed a piece of track and finished out the day in a certain ditch.

Can you imagine any more ineffectual method of accomplishing this work? How much time is spent in movement from one place to another, changing tools or in the interruption of one duty to perform another of more importance, and how much in simply finishing out the day? What is the most economic way of doing each and every item that is to be done, considered separately? These are questions for the management of every mine, and each item of work should be taken up independently and its performance and completion provided for irrespective of interruption.

Should a pump break down you would not deliberately send for the maker to come to fix it. His entire interest would be to put in as many repair parts and as much time as possible, without being sure the parts and work were necessary. Yet on a bad piece of track the same track gang that miserably laid it returns to make the repairs, and their entire interest is to continue the repairing, for therein is their daily bread. It is to the interest of the driver to tear up a piece of track by derailments for his "buddy" the track man to fix; the miner to produce a fall for his cousin the slate man, or to break his roof for a friend the timber man.

By the elimination of the employees listed under division D the bare operating costs show a surprising reduction. There is work along the track or in the ditches that needs attention, and the foreman has a notebook in which these are listed. A small percentage of the mines work every day, and on the first idle day he has an opportune time to cross several from his list. The labor has cost him a minimum and is properly done under his direct supervision.

It is a common fallacy among operators to "cut" everything off during an idle day or two in order to economize. They are practicing the most expensive method of operating. When the foreman's attention is engrossed in his necessary and profitable duties of getting the coal over the tipple he is flooded with an abundance of labor in ditches, timbering, track laying and bratticing, to idle away time in a crosscut or hide in the air course. When the mine is idle and he has the time to attend to these labor expenses, his hands are tied; the money has been spent and little has been accomplished.

The ideal condition of eliminating all regular employees listed under division D may never be fully reached, but the closer they are approached the more will be the economy, the better the conditions and the closer will we reach the coöperation of all employees for their own and the company's advantage.

In experimenting with this system one noticeable advantage is the tendency to do each job thoroughly and completely. Gradually the foreman and his assistants are working their way out of the usual mining difficulties and their troubles are diminishing.

⁂

Western Coal-Rate Advances

By H. S. Mikesell*

The Western rate situation, so far as it affects Illinois coals, is still receiving considerable attention. It is now definitely understood that the advances will be checked in by all the lines interested and will become effective probably Sept. 30; but if not then, certainly on Oct. 30.

Officials representing the southern Illinois carriers express themselves as feeling reluctant to take this step and are greatly disappointed over their failure to secure additional revenue on livestock and packing-goods products. Some of them intend immediately to petition the commission for a rehearing on these items, and if necessary they will consent to reopen the whole case on all commodities. To be consistent, they must of necessity show evidence of their intention to avail themselves of the relief previously granted by the commission by actually advancing the rates on coal.

Some of the roads intend to attempt to secure a continuance of present rates on fine coal—that is, Nos. 2, 3, 4 and 5 washed sizes and screenings. The Illinois operators have been asking special consideration and protection on these sizes, which become the maximum burden at the time that the advances go into effect.

It is not unlikely that if a rehearing on the 5-per cent. case is denied, or if additional hearings are granted and further awards made on the other commodities, some of the roads may feel warranted in reëstablishing the old rates. The situation is still involved and full of complications, but inasmuch as considerable tonnage originates at southern Illinois mines it is apparent that it is the purpose of some of the carriers not to jeopardize the movement of this tonnage at the new rates.

⁂

Wanted--An Engineer

Important and responsible mining interests wish to employ a safety and efficiency engineer who is thoroughly experienced and fully acquainted with general mining conditions in the United States. The man desired must be entirely familiar with all devices of life-saving practice such as are adapted for the prevention of accidents in and about mines.

Anyone who feels qualified to make application for this position should write to the Editor of *Coal Age,* stating briefly his experience and training in the lines designated. All applications will be kept in strictest confidence and will immediately be sent to the people desiring such a man.

---

*139 West Van Buren St., Chicago, Ill.

Distinction Without Difference

A competent man, an auditor, recently resigned from a company with which he had been associated for a long period of years. A friend, surprised at his action, asked him his reason for leaving.

The reply was brief, but seasoned with wisdom and to the point.

"I was in the wrong end of a good concern and I wasn't paid for my work like the fellow in the operating end. There was nothing ahead for me."

The man who asked the question—and who, by the way, was the president of a coal-mining concern—was struck by the answer, for he knew from experience that correct principles and practices in accounting are just as essential and worth as much to the life and future of a coal-mining company as a good engineering and operating organization. It was not long before his own auditor received a raise.

It is to be wondered why so many business men of sound judgment as to the selection of coal fields, markets, operating organization, etc., will so often give the accounting side of their business venture but little thought. They seem to forget that the very life of the concern must and does depend on whether it is conducted along sound accounting lines. How many coal concerns have gone to the wall because no provision was made in the accounting methods to provide properly for depreciation or not at all for extraordinary contingencies, such as fires, floods, strikes, explosions, etc.!

The trouble seems to be that a distinction has been created and a line drawn as to the value of operating methods and men as compared to accounting men and methods, as if there was a great gulf of difference between them, when as to their importance in the successful conduct of any business there is none.

Ask any live manager of nearly any coal concern if the cost sheets he looks over every month, and from which he figures what he can sell his product for, really represent all the cost. If he's honest he will tell you "No." With all his business acumen he is deliberately pursuing a course that he knows is wrong.

Why does he do it?

Because he too is in that rut of thought which draws a wide distinction between the value of sound accounting methods and principles as compared to the side of his business that is all action and filled with tonnage figures. This blinds him to the true value of the quiet accounting end of the business.

Coal-mining men especially have got to cut corners pretty fine to keep up with the procession. That they are so often misnamed "barons" is, more than anything else, due to the fact that neither the owners, stockholders nor the public have been taught that it is proper to pay a greater amount of attention to correct balance sheets than to total tonnage figures.

Too often a man with a coal mine is like a man with an automobile—he is considered well to do when really he is anything else.

It is time we began to quit drawing distinctions when no difference exists. When we adopt such a policy, the right kind of auditors will be greatly in demand and will be paid in proportion as much for their work as managers and superintendents are paid for theirs.

Pages from a Miner's Notebook: Efficiency

Efficiency, to the modern efficiency engineer, is the means to an increased production with the same number of men in the same, or less, time. To me efficiency is summed up in doing my day's work well, or even a little better than yesterday, with the least possible expenditure of energy and exertion. I spoke of this today to two of my fellow-workmen.

One of them laughed. He is a big, burly Italian who works in the next place. I hear him all day long rushing about, humming or singing snatches of song in his native language—now here, now there, always in a hurry and fury of endeavor. He is a good workman, and works very hard. Digging a little coal here this minute and the next running across the room to dig a little there; pushing his cars to the face on the run almost; loading them in record time and dropping them to the turn; carrying up his timber as he needs it, dragging in his rails, rushing for his track hammer over there and his spike bar and bucket of spikes elsewhere—using brute strength in his every action and accomplishing his day's work in good time and in good form. He earns as much as I, probably more some days, and his place is a model of safeness and neat workmanship.

My other friend nodded his head thoughtfully. He is a young German, not many months from the Fatherland. His place is some little distance from me, yet occasionally I find time to drop in on him. I enjoy his frank criticism of our methods of mining and our customs in general. He never seems busy. Always cool, always in action and making every motion lead naturally to the next, he loads his turn with seemingly the least possible exertion. He has coal dug and laid by and when not at other work he is in the cut, always working ahead, always paving his way to a better day's work tomorrow.

His timbers are all put into the cars he pushes to the face; and he always has a few in readiness. His rails are brought in in the same manner. His ax and saw and measuring sticks are always together in a convenient place, and his track tools are seemingly inseparable. He does not sing, but his cheery low whistle is always to be heard. His day's work accomplished—as much and as well as my neighbor's—he comes out of the pit with shoulders back and head erect, always ready for a friendly tussle or a frolic, and with, I imagine, a sense of accomplishment equal to that of the man who laughed at my idea of efficiency.

There is little difference in their earnings. They have each done a good day's work. Yet one of them is a better workman. Which?

⁂

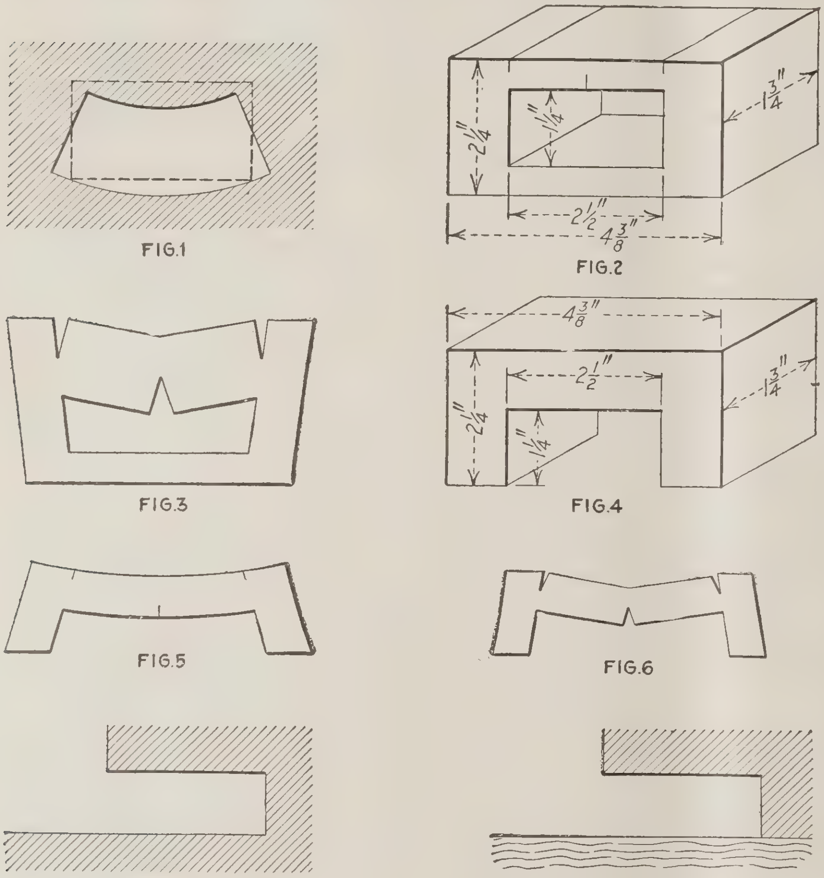
Cleaning a Centrifugal Pump—At the Johann Deimelsberg mine, in the Werden district, Germany, a centrifugal mine pump, which had to raise 6 cu.m. of water per minute to a height of 250 m. worked under considerable disadvantage on account of mud clogging the pump. In order to prevent this deposition, the following plan was adopted: After the centrifugal pump had been stopped the slush which collected in the pump was drained and clear water substituted, 1½ to 2 liters of mineral oil was added and the pump put in motion and worked in dead water for a few minutes. Water and oil were thus mixed and all the internal parts of the pump wetted with the oily water. After the pump was stopped again, this oily water was allowed to remain inside the pump until it was put in use again. Since this process has been followed regularly the clogging has ceased and the pump can be used steadily and with very little attention.—"Mexican Mining Journal."

Stresses in the Mine Roof*

By R. Dawson Hall

SYNOPSIS—There is a regular procession of collapses in the mine roof, and there are new structures resulting from each collapse. The failure of the roof is progressive. From its first condition as a holoid, it becomes in turn a pyoid, a cumoid and a conchoid, and then fails completely

The stresses in the simplest structures are often those which we find most difficult to analyze. Thus the most complex condition in mine stresses is found in simple tunnels where the roof, the sides and the floor are a monolith. The functions of the parts are like the parts themselves not distinct and specialized, and the problems to be solved are largely indeterminate, like those in a metal structure with riveted joints or a redundancy of bars.



FIGS. 1 TO 8. ILLUSTRATION OF PRIMARY ROOF STRUCTURES

Fig. 1 shows in broken lines a cross-section of a tunnel, and in full lines the same tunnel distorted by pressure. This is a typical holoid structure. Fig. 2 shows a soap model to which reference is made in the article. Fig. 3 exaggerates the upper or roof bar in the soap model and shows how the collapse of the roof forces back the sides by the arch action. Fig. 4 shows the soap pyroid without load. Fig. 5 shows the same when the bending of the roof bar takes place, thrusting out the ribs, or legs. Fig. 6 shows a further action when the revolution of the segments in collapse tends to force back the upper parts of the ribs, or legs. Fig. 7 illustrates a semiholoid structure. Fig. 8 illustrates a semipyoid structure.

This difficulty explains perhaps why the condition has not been treated. But just because it cannot be discussed in its entirety is no reason why it should be regarded as an action of parts with specialized functions as if the structure treated were a roof beam with independent supports resting on a detached foundation. The problem cannot be ignored on the ground that it is not of sufficient importance to warrant careful consideration, because conditions of complete monolithism, of which the tunnel is the type, are found materially unchanged in room-and-pillar and in longwall work.

Holoid or Truly Monolithic Roof

This unity between roof, sides and floor, which to the coal miner is a difficult conception, really deserves a scientific appellation, and perhaps holoid (from *holos,* whole, and *eidos,* form) will serve the purpose as well as any other.

In a simple tunnel the roof, the sides and the floor form integral parts of one and the same structure, and the distortion of one cannot be conceived without a consequent strain in the others. Thus when the roof of the tunnel droops by reason of its weight, the upper parts of the sides are drawn in because they are integrally connected with the roof and must approach each other whenever, by the sagging of the roof, the distance between any two points in it is diminished (see Fig. 1).

The sides in their turn operate on the floor of the holoid structure, producing a tensile stress. The value of soap as a means of illustrating the action of mine stresses has for a long time impressed me. With that idea in mind a cake of naphtha soap measuring 4⅜ by 2¼ by 1¾ in. was taken and a rectangular hole representing a tunnel was made through it 1¾ in. long, 2½ in. wide and 1¼ in. high (see Fig. 2). A load was then placed at the mid-span of the tunnel. Eventually, the upper bar, or "roof," broke at the center line and along both "ribs" of the tunnel, the breaks being approximately vertical and proceeding, as might be expected, on the ribs from the "surface" downward and at the center line from the tunnel upward, the failure being from bending moment, not shear.

This is interesting because it shows that breakage *at the ribs* is not necessarily evidence of shear. It may be only a demonstration of a holoid structure. It is the form of failure whenever coal is blasted down and not an infrequent form of roof demolition. The test on the soap tunnel further showed that as soon as rupture takes place in the roof of the tunnel, there must inevitably come a thrust on the ribs. The tension draws them together till rupture occurs and then the two roof units, in endeavoring to revolve, crowd each other and push on the opposing walls (see Fig. 3).

When a holoid structure, by reason of the weakness of the floor or because of a lack of adhesion between the ribs

---

*Article presented at the San Francisco meeting of the American Institute of Mining Engineers, September, 1915.

and the floor, ceases to engage the floor in its movements, then its shape as a structural element roughly resembles the Greek letter π and for want of a better name we might term the new element a pyoid structure (see Fig. 4). The doctors use the word for a totally different purpose with little excuse. "Pyonoid" is the word which they should use to express the attributive "pus-like."

By reversing the soap tunnel after the roof has been caved the weakness of the pyoid structure is made clear. As soon as pressure is brought on the new roof (formerly the floor of the tunnel), the two ribs are seen to recede markedly and it is evident that when the floor is intact there must be a well-developed stress in that element of the holoid structure (see Figs. 5 and 6, showing progressive demolition).

Probably it is well here to express a belief in the importance of the holoid. The general notion is that all the beds shear horizontally along the lines of stratification and that it is a mistake to consider the mine or even the roof as a monolith. It is true that most of the accidents in mines are due to the lack of unity in the roof. What we call draw-slate accidents are almost wholly due to this fact. Nevertheless, it is interesting to note how firmly roof and coal are usually "burned" to one another. Even when undermined and sheared on both sides the coal often fails to fall, being supported by the vertical shearing strength of the one side still attached and by the adhesion to the roof. I am hardly prepared to state when the holoid structure ceases to exist, and of course the time of its occurrence and the conditions under which it will develop vary with the materials under consideration.

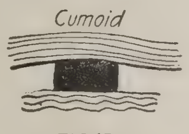

FIG.13

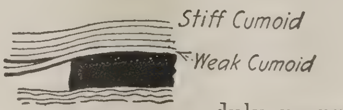

FIG.14

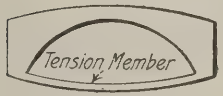

FIG.15

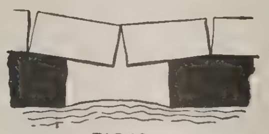

FIG.16

FIGS. 9 TO 16. SHOWING LATER STAGES OF DEMOLITION

Fig. 9 shows a semiholoid such as often occurs in longwall, supporting a cumoid which, being separated from the semiholoid, has freedom of movement except for the restraint of frictional contact. Fig. 10 shows a semipyoid likewise surcharged by an independent cumoid. Fig. 11 is a plan of a circular excavation. The sagging of the roof into this area produces an area of quasi-elevation; that is, an area which would be elevated if the mineral itself and the floor surrounding the excavation were incompressible and indestructible. Outside this area is one of depression, the stiffness of the measures lightening the burden on the area of quasi-elevation and loading with increased heaviness the edges of the excavation and the area of depression. It exhibits the fact that the action of the roof is cumoidal, or wavelike, and not confined to the area of excavation. The depressed area is in its turn followed by another area of quasi-elevation, and this again by an area of depression. The size of these waves of course decreases as the area of excavation is left behind. Fig. 12 shows a cumoid bending over an opening and crushing two pillars. Fig. 13 shows a cumoid bending over a pillar, the center of which is a point of quasi-elevation. The roof tends to break over such a support. Fig. 14 shows a weak cumoid, such as a loose draw slate which has broken away from the stiffer cumoid above and probably has insufficient moment of inertia for self-support. Fig. 15 is a Luten bridge, showing the lower tension member, or paving, which ties the abutments together and prevents their recession, thus adding to the strength of the bridge. Fig. 16 shows a broken cumoid failing to fall owing to an arching action.

How Holoid Stresses Tear Slabs Off Ribs

It is obvious that with the holoid structure, the ribs being drawn together by the movement of the roof, they must tend more or less to be split vertically and in longwall they will then fall down on the advancing undercut. In certain sub-bituminous mines I have noted a tendency toward what I thought was a vertical shear parallel to the headings. This developed rapidly after the work was opened, especially at great depth.

Whether this was only a vertical shear seems doubtful. It may have been due to the holoid character of the structure, the ribs receiving no relief by a horizontal shear between ribs and roof. Instead the roof pulled off the edge of the pillar as the former bent under the load. It was interesting to note that these lines of fracture did not coincide with the normal cleavage of the coal.

The rending along vertical planes eventually throws back the real rib lines far into the pillar. Where the draw slate and roof proper leave one another, we have probably a plate structure superposing one which is holoid or pyoid in character, and in the longwall the breaks back of the face which bring coal and roof down together. or which tend so to do if the latter is not duly propped, are failures of the semi-holoid or semi-pyoid and not of the plate structure above (see Figs. 9 and 10).

Roof Crowds Between Ribs and May Not Fall

The breaking of even the holoid roof is not necessarily a sudden, unheralded event, such as one might anticipate from a cursory consideration of the problem. It is clear that the action of the moments cannot destroy the roof without revolving in a degree the elements into which the roof is broken, and any revolution inevitably binds these elements against one another so that they are less able to fall. Either a recession of the ribs or a further demolition of the revolving elements must take place or the roof cannot descend. One form of demolition which frequently occurs in shallow workings is vertical shear extending the cracks already made by the bending-moment stresses. But horizontal shears may make it possible for the roof masses to revolve and yet fit the space they occupied by a counter revolution of the strata past each other. Or again, the whole mass may be broken up by the rubbing of the opposing faces of the elements as they try to fall.

It is this last action which is in evidence in coal brought down by a shot when it is broken considerably in falling, and that vertical shear is not an important cause of the fall of coal is shown by the fact that there is a distinct tendency for the coal to roll away from the side ribs.

It is necessary now to consider the plate structure in which the roof is considered as a vast plate, a monolith in itself but resting without adhesion on its supports. Whenever there is a mined area the roof is depressed, and being elastic it tends to rise on the surrounding supports, resting its weight on the edges of the surrounding ribs of the excavation. This area of quasi-elevation is followed by another area of depression surrounding the central depression and the area of quasi-elevation. Thus the roof plate is bent into a series of waves around the central area of disturbance just as the surface of the water is rippled round the point where a stone has fallen and disturbed its equilibrium (see Fig. 11).

Of course, the elevations are only relative, not actual, and naturally, like all undulations, as they recede from the point of disturbance they die down. But it is essential to remember that while the holoid structure is to a large extent a closed force chain, this is not nearly so true of the roof plate, the stresses in which are less localized and circumscribed.

The Cumoid, Wave-Like or Plate Structure

This structure we may dub as cumoid (from *kuma,* a wave). The remarkable feature about such a structure is that it develops points of great stress far away from the disturbing cause, and it may break over the pillar instead of in the opening. The appearance of the Forth Bridge, Scotland, is known to almost everyone. The light structural work over the midspan contrasts most forcibly with the heavy structure over the piers. It is the case with all cantilevers and continuous-arch structures, and the roof in the mine is like a continuous arch, only it is continuous not only in one, but in every direction.

It is the peculiarity of the cumoid structure that the stresses it involves may be greater farther from the point of disturbance than at some nearer point. But, like the holoid structure and the pyoid, it puts the greater burden on the pillar's edge. The center of the pillar between two large open spaces may be relieved from much of the normal pressure because of the bending of the cumoid roof over the pillar (see Fig. 13).

There is some evidence that in actual operations in some sections of the country the roof soon breaks by horizontal shear into two or more separate cumoid structures, of which of course one is free of external load, while the others, though below other cumoids, may or may not be loaded over the unsupported area. If the stiffness of the upper cumoid, or cumoids, exceeds that of the lower, the loading may be relieved from the open spaces and the upper cumoids may restrain the lateral, and therefore the vertical, movement of the lower cumoids, thus adding to their resistive strength.

Reasons Why Roof Failure May Spread

In an interesting paper read before the winter meeting of the West Virginia Coal Mining Institute, the late F. C. Keighley called attention to the fact that when the lower roof broke or was preparing to break in the mined spaces of the Connellsville region it frequently weakened the lower roof in the rooms and headings nearby, despite the strong support afforded by large pillars. This caused in the narrow places many falls which had to be loaded out.

It would seem, therefore, that the breaking of the lower roof or its initial stressing tears the lower roof from the upper and from the ribs, converting it into a cumoid structure which is too weak to stand the strains to which it is exposed. In cases, however, these primary failures may be due to substitution of a pyoid for a holoid structure. For it must not be forgotten that where the bottom, ribs and roof are one and indivisible, the floor is an element of strength and prevents the roof from breaking. Just as the lower flange in a rail helps the ball of the rail to support the weight, so does the floor help sustain the roof so long as the former is unbroken.

One of the patented features of the Luten bridge construction is its holoid structure. Luten does not use the term, but nevertheless the construction is closely analogous to the structure I have been describing. Luten builds not one bridge but two, one for vehicles to pass on and one termed the stream pavement to bind the feet of the piers together so as to form a perfect holoid. Destroy the lower bridge and the upper or traveling bridge is in a precarious condition (see Fig. 15).

The holoid structure gives the strongest of roofs; the pyoid is less strong; the cumoid is still weaker. Every horizontal shear makes the roof progressively less stable. Strange to say, vertical cracks permit the replacement in many cases of a less stable by a more stable structure. The fractures in a vertical direction, which would ordinarily be thought more detrimental than those in any other direction, prove not unimportant, it is true, yet in a way strengthening.

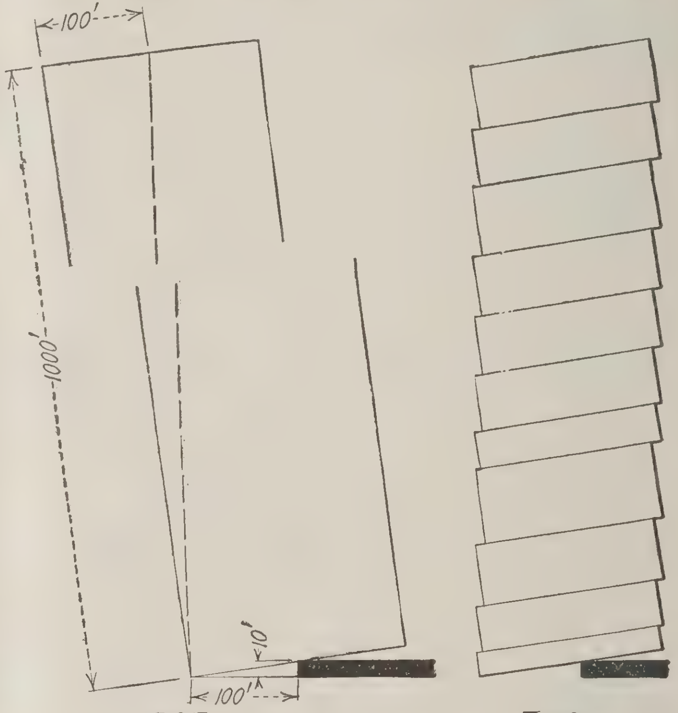

FIG.17 FIG.18

FIGS. 17 AND 18. SHOWING HOW DIFFICULT IT IS TO DESTROY A CONCHOID ROOF STRUCTURE

Fig. 17 shows the large amount of displacement needed to permit the unbroken fall of one leaf of a conchoid, or broken cumoid, 1,000 ft. deep. Fig. 18 shows how the needed distortion is secured by horizontal shears at places of weakness.

The Conchoid Is the Last Resistant Structure

When a cumoid of great depth finds itself inadequate to its own support as a cumoid and begins to rend vertically from the surface downward to its supports and upward from the span centers to the surface, then the cumoid beam becomes an arch, and the cumoid plate becomes a dome and until it fails in its new structural relations, it cannot continue to extend those rents which threatened its stability. Let us say that the cumoid has become a conchoid (from *conchus,* a shell), the lines of stress forming figures resembling one shell of a bivalve.

As the elements of which the roof consists crowd each other into the opening it is impossible for the roof to rupture or fall until the various strata cease to act as a unit and begin to slide past each other (see Fig. 16). If we imagine an element of rock stretching from a rib to the half span, a distance, let us say, of 100 ft.; if we further suppose the excavated coal or other mineral to be 10 ft. thick, and regard the rib, floor, and falling-rock element to be so adamant that none of the three will crush, heave or bend, then the inclination of the element when one corner reaches to the floor will be 10 per cent.

If the excavation is 1,000 ft. below the surface, the displacement of the block at the surface would have to be 100 ft. (see Fig. 17). At a greater depth the displacement would be more. It is needless to say that such an elbowing of the adjacent rock masses cannot occur even where the crop, broken roof, or the sags in nearby workings make a certain amount of lateral adjustment possible. But horizontal shear along weak planes, such as beds of clay or coal or stratification planes, will permit such a number of readjustments in the element of rock itself that it will be able to come down. It will, in fact, only *tend* to tilt; it will not actually upset forward as this would involve too many other changes (see Fig. 18).

This, then, is how the end comes unless the rock is too strong to shear horizontally. Subsidence ceases when the required deformation has taken place. The choking up of the falls probably has but little to do with the final result, though it may have its effect in some cases. In fact, the theory as given is comforting to the conservationist, as the beds above the one extracted suffer but little, being exposed only to the horizontal shearing process, which is by no means destructive of the integrity of the measures.

However, the rupture at the half span may often result in falls of moderate size at that point, for when the monolithic roof is weakening by successive horizontal shears, we have a series of superposed cantilever cumoids entirely unequal to the task of self support. If the action which forms these cumoids does not let them all down to the floor suddenly, they will be sure to fracture successively from the bottom upward, and such seams of mineral as partake of this independent action will be destroyed.

⁂

Extracts from a Superintendent's Diary

Everyone who reads the daily papers can know that in most coal-mining districts the companies that own the mines also own the houses in which the miners live, as well as the commissaries from which the men buy their supplies; and knowing that, it is so easy to assume that the mining companies come pretty near to owning their employees, body and soul. The fact that in most cases the company has no alternative in the matter of owning its entire camp is never taken into consideration.

I have just gone through an experience which has made me realize that the owning of the houses and commissary by an operating company does not necessarily enable the company's superintendent to regulate the domestic affairs of the employees in an arbitrary manner.

About three weeks ago one of our assistant mine foremen lost his life, probably because of his own carelessness; still he had been attending to his duty and had gone about it in a conscientious way. Under the circumstances every one felt very much distressed by the accident, especially because the unfortunate fellow had always been a faithful worker, loyal to his company and solicitous about the welfare of his subordinates. A week after his death I took the matter up with the company's casualty department to see what could be done for his wife and children. It is reported that, according to the evidence, the company's liability would be hard to establish, but it would waive this advantage and permit me to offer the maximum sum allowed by the company for settlement of cases out of court.

I felt sure that the widow would be governed entirely by my advice and so I hesitated about laying the matter before her and finally decided to talk the proposition over with her two brothers, who had come into camp to assist her.

They laughed at my offer and intimated that they would like to see any company beat their sister out of her rights by compromise.

Of course I felt very much put out in having my good offices misconstrued and repaid by insult, but because of my affection for the dead man I overlooked that and decided to await developments.

They were not long in coming.

Yesterday one of the brothers came to my office to inform me incidentally that he was leaving, but he managed to tell me that he had advised his sister to remain in possession of the company house and to trade at the company store until her rights could be decided by the courts, and in the meantime if anyone attempted to oust her from the house, or if the company refused to supply her with goods required from the commissary, she was to go through the camp and impress upon all the inhabitants what a soulless company they were working for.

What an unpleasant predicament.

Undoubtedly the brothers have made the widow believe that it is the company's duty to allow her to remain in the house and supply her from its commissary until the court gives her satisfaction, and if I should attempt to acquaint her with the actual facts in the case she would decide that I was trying to take advantage of her. I would rather pay her house rent and her grocery bill indefinitely than to attempt to persuade her that she ought not to follow her brothers' advice, and yet if I should allow such a precedent to become established my usefulness with the company would soon come to an end.

It's just another instance illustrating the crying need of an adequate and universally accepted liability law.

⁂

Speaking as an Inspector of Mines, R. Donald Bain expressed himself in favor of compulsory watering. Referring to an accident in his district (Durham, England), he said that if the regulations as to watering had been carried out there would have been no explosion at all. On this point British mine inspectors are constantly remonstrating. Their remonstrances have had some effect, and there is also a tendency to understand the dangers of dust more than there used to be. "Wet zones" have been proposed and provided, and in the view of Mr. Bain it is possible that if an explosion occurred the area of it would be limited by their action. Most haulageways can be watered without interfering very much with the roof and floor, but where there is a great difficulty in watering these haulage-roads and where they can only water here and there it would be desirable that the types of cars used should be such that the dust could not easily escape, and even then the cars should be watered in order to prevent the scattering of dust.

⁂

The Tensile Strength and Elongation of Copper Wire varies considerably with its size; annealed soft copper wire ranges in tensile strength from 30,000 lb. per sq.in. in the coarser sizes to 42,000 lb. in the fine sizes. Hard-drawn copper varies in tensile strength from 45,000 lb. to 68,000 lb. per sq. in., according to size. Moreover, a solid unstranded copper wire of larger diameter than 0.46 in. is hard to splice.

The Labor Situation

SYNOPSIS—Under pressure from labor leaders the tridistrict convention makes fewer and less stringent demands on the operators than did the Scranton miners. The check-off will not be demanded in the anthracite field. West Virginia operators will have to pay an increased freight rate of 15c. per ton. The Hocking Valley operators hope to secure concessions which they claim are needed if they would compete with the eastern Ohio field.

On Tuesday, Sept. 7, the miners' representatives of all the districts in the anthracite region, Nos. 1, 7 and 9, opened their tridistrict convention. The meeting was held in Hampton Hall, Wilkes-Barre, Penn., nearly 450 delegates assembling. The expenses of the meeting will be large, each delegate receiving $3.75 per day. Some have even estimated a total cost of about $4,000 for each day the session continues.

To guide the convention were the resolutions passed at the meeting of the delegates of district No. 1 in Scranton on July 19 and recorded on page 174 of the issue of "Coal Age" of July 31, but the pressure of the labor leaders, especially of J. P. White, the president caused a slight modification of the demands. These are still unreasonable, but the miners' claims as usual must not be regarded as ultimate; they are purely haggling proposals to be modified later, and they are only made large in order that the miners may be thought reasonable by the public when they surrender some of their demands. "Look," they will say later, "how much we have conceded."

Report of the Anthracite Scale Committee

There were fifteen men in the scale committee, five from each district. Reese L. Morgan was chairman and C. L. Brislin, secretary. The demands were as follows:

(1) The next contract shall be for a period of two years, commencing April 1, 1916, and ending Mar. 31, 1918, and the making of individual agreements and contracts in the mining of coal shall be prohibited.

(2) An increase of 20 per cent. shall be made on all wage rates now being paid in the anthracite coal fields.

(3) An 8-hr. day shall be granted all day labor employed in and around the mines, the present rates to be the basis upon which the advance above demanded shall apply. Time and a half shall be paid for overtime and double time for work on Sundays and holidays.

(4) Full and complete recognition of the United Mine Workers of America of districts Nos. 1, 7 and 9 shall be accorded.

(5) A more simple, speedy and satisfactory method of adjusting grievances than now provided shall be arranged.

(6) Contract miners shall be restricted to one working place.

(7) The selling price of mining supplies shall be fixed on a more equitable and uniform basis.

(8) All coal shall be weighed and payment shall be made for it on a run-of-mine basis, 2,240 lb. constituting a ton.

(9) The machine-mining scale shall be readjusted so that equitable rates and conditions shall be assured.

(10) The arrangement of detailed wage scales and the settlement of internal questions, relative to both prices and conditions, shall be referred to the operators and miners of each district, to be adjusted on an equitable basis.

Comparison with the Scranton Demands

As districts Nos. 7 and 9 do not meet before the tridistrict convention, and consequently have not so far met, it is of interest to compare the conclusions reached by this Wilkes-Barre meeting with those at which district No. 1 arrived in its July session. There is a significant omission in the first demand of the Wilkes-Barre scale committee. The delegates at the Scranton convention declared for "a recognition of our organization with the right . . . to provide a satisfactory method for the collection of its revenues." In short, the demand of No. 1 district was for the "check-off."

For some reason this has been dropped, but the miners apparently did not recognize, at first, that the demand for this privilege had been withdrawn. President White has declared, however, that no attempt will be made to secure it, as he does not believe it can be obtained and does not want to ask for more than will be granted. It is hard to believe that Mr. White could regard the check-off as any more difficult to obtain than some of those unreasonable demands which he could not induce the committee to remove from the scale demanded. He is surely not unwilling to tack on to his program so important an item for the perpetuation of the union. Only those who doubt the value of the union or its leadership or its right to the adhesion of all miners are opposed to the check-off.

There are, of course, several opposed to the deduction of money from the miner's pay for union dues. These people are dubious about the union and do not believe the miners should be compelled to join it; but surely J. P. White is not among these. It seems natural to suppose that he believes that the check-off, while not popular with the public as is the making of a bargain with the union and the 8-hr. day, will inevitably follow complete recognition and will be won without fighting when the operators have once made a contract with the union as an organization.

Wage Increase of 20 Per Cent. Demanded

The demanded advance in wage in the Wilkes-Barre scale is 20 instead of 25 per cent. The demands propounded by the Scranton convention made quite clear what effect the increase was to have on the pay of day laborers. They were to work 8 hr. for the price of nine and were to receive a further increase of 25 per cent. Their raise in wage was to be 12.5 per cent. per hour and 25 per cent. additional, which figures an increase of 40.625 per cent. per hour. If the addition is to be reduced to 20 per cent., then the increase for each hour is 35 per cent. The meaning of the Wilkes-Barre convention on this matter is by no means clear. It says "the present rates are to be the basis upon which the advance above demanded shall apply." It does not say whether the rate per day or per hour is the rate intended. If the rate per day, the day worker will gain in actual wage per day 7.67 per cent., which is a small gain compared with that of the miner, which is 20 per cent.

In any event the demand, if conceded, cannot fail to raise immensely the cost of producing coal. Mr. White said some time ago that the Delaware, Lackawanna & Western R.R. Co. was making 33c. per day clear profit off each of its men, and that 19c. of this was excessive. Assuming that this profit is typical of anthracite corporations, which it is not, the increase would far more than wipe out the portion of the dividend regarded as unfair, and in fact the entire dividend, even if the lowest interpretation is put on the contract offered by the Wilkes-Barre convention. The miners are evidently looking not to the companies but to the public for their increase. That may be perfectly permissible, but it is not right to declare that the companies can pay it out of present prices.

Still the large concessions demanded of the operators—or should it be the public?—are not satisfactory to the Schuylkill delegates, who believe that in view of the many dangers to which miners are subjected the pay should be larger.

Miners Will Now Discuss Matters with Operators

The committee of miners who will meet the operators is clothed with power to negotiate the best contract possible. This will be submitted for the ratification either of the local unions or, if Mr. White has his way, to a tridistrict convention as in 1912. But the meetings will not be started till about February, when the Indianapolis convention has concluded its sessions.

It is difficult to say who will lead the operating concerns. George F. Baer, when living, undertook that responsibility. It is thought that Col. R. A. Phillips will be selected this year; but it is hardly probable that there will be any recognized leader. Colonel Phillips is hardly a proper selection, as his arguments are weakened by the fact that his company has been more successful than any other in making large dividends. The Philadelphia & Reading Coal and Iron Co.'s president could always sustain a better argument. The miners are trying to drive a salient into the operators' lines through the Delaware, Lackawanna & Western R.R. coal department's weaker defensive position.

It seems probable that if anyone is chosen to express the position of the operators, it will be E. W. Parker. It has always been customary in bituminous fields to select such an officer for negotiations of this sort, though as a rule he has been a recognized labor leader transferred to the operators' ranks for that purpose. A man as disinterested as Mr. Parker is apt to reflect the judgment of all companies concerned.

Many D., L. & W. Employees May Receive Back Pay

The Delaware, Lackawanna & Western R.R. coal department may have to pay $70,000 to $100,000 back pay to their inside, outside and assistant foremen, their driver bosses, firebosses, weighmasters, clerks and others. When the miners in 1912 secured their present contract with the operators a wage increase was provided of 10 per cent.

A short while before the contract was signed the salaried men were given a voluntary increase of $5 a month. They were not given the percentage increase because they were salaried men and the company took the position that they were not parties to the contract. The electricians, electricians' helpers and watchmen at the collieries objected to their being excluded from the increase. The miners took up the claim of these men and the conciliation board considered it. A deadlock ensued, and the case went to Judge George Gray, who decided against the company. The payment under this decision amounted to only about $5,000, but now all the other bosses are claiming under it.

An inside foreman, for instance, under the old contract got $120 a month. He now gets $125, but the award gives him $132. So he has coming due him $7 per month for 43 months or $301 up to Oct. 1. The lower officials will not fare so well, for $5 more nearly represents the whole amount of the increase they would normally secure. It is only on the part of their salary above $50 per month that they will obtain an increase if it is paid.

Railroad Rates Are to Be Raised 15c. in West Virginia

The Ohio coal operators have won a substantial victory in their fight against the unfair differential in freight rates that gave the operators in West Virginia a great advantage over them in the coal markets. The fact that the interstate railways in West Virginia, Pennsylvania and Ohio have raised the differential from 25c. a ton to 40c. is the biggest victory which has come to Ohio operators in many years.

Freight rates showing this increased differential will be filed with the Interstate Commerce Commission in Washington at once, and as soon as approved will become effective. The 40c. differential in favor of Ohio coal will be based on the rate to Toledo, and a proportionate differential will be employed for all other markets of the state.

This great boom to Ohio operators came as a result of a conference between the Interstate Commerce Commission and the executives of the coal-carrying roads affected, which was held in Washington during the week. M. J. Caples, vice-president of the Hocking Valley Ry., which is affiliated with the Chesapeake & Ohio Ry., announced the result of this meeting upon his return from the conference.

Coal operators are pleased over the action and predict the early resumption of some of the mines in the Hocking Valley and eastern Ohio districts. It is planned to get the miners back to work as soon as possible, so that they may have the coal ready for shipment when the new rate becomes effective, which should be within 30 days.

Hocking Valley Operators Seek Concessions from Miners

Equally important is the step taken by the Hocking Valley operators themselves. They have brought to the attention of the workers the reasons why, in their judgment, work has been suspended so long. The Hocking Valley operators ask that the same conditions be imposed upon them as are now in successful operation in the eastern Ohio coal fields. They hold that unless this is done the operators in the latter district will gain a stand which will be hard to overcome and may enforce idleness on the southern plants of the state. If the same conditions are adopted by the union men in the Hocking Valley, the operators claim that all the mines will be opened without delay.

They point out these features which are in force in eastern Ohio, but not in the Hocking Valley field: A definite list of holidays which the miners are permitted to observe; a series of regulations that materially aid in the production of clean coal and that provide fines for miners who fail to observe these rules; specified conditions for setting and resetting posts and the rates that may be charged therefor; provision that no strike shall be called for any cause other than a failure to pay wages, and that no mine shall close down on account of a funeral. Frequent holidays and funerals for many years have been the bane of operators.

Military Court of Inquiry in Colorado

A military court of inquiry is investigating the Colorado National Guard. It was originally appointed by the governor to inquire into the charges of corruption in that body and into the efficiency of Adjutant-General John Chase and other high officers in the militia, but its investigations have been greatly extended. It is endeavoring to discover the motives of those who brought the charges, and it has publicly accused President Wilson and national army officers of aiding the United Mine Workers of America to prevent the rehabilitation of the guard, and it has charged that the Federal investigators in Colorado have worked with agents of the United Mine Workers to the same end.

By order of the governor, Lieut.-Col. E. J. Boughton, president of the military court, and himself one of the officers named in the charges of corruption, has made public a statement that the court has obtained sworn documentary evidence of a conspiracy hatched by agents of the United Mine Workers to hinder the reorganization of the militia and to procure indictments, by misrepresentation, against Governor Carlson, Attorney-General Farrar, high militia officers and leading coal-mine operators and those who have financed them.

Boughton has also charged, on the authority of the governor, that the decision of the state Supreme Court, prohibiting Judge Hillyer from presiding over the trial of three miners involved in the strike, reached Washington 11 days before it was "handed down." This accusation attacks the integrity of the court or of some of its employees, or assumes the commission of a theft, and it is so grave a charge that it will undoubtedly be considered by the Supreme Court at its next sitting.

Union Denies Charges of Illegal Practices

William Diamond, organizer for the United Mine Workers of America, who is said to have succeeded John R. Lawson since the conviction of the latter at Trinidad, frankly admits through local newspaper interviews that the United Mine Workers has had detectives in Colorado gathering evidence on which to base criminal complaints against state officials and coal-mine operators. Only the agitated state of public feeling could distort such activity into an offense, provided the means by which it obtains the evidence it is seeking is wholly within the law.

Mr. Diamond emphatically denies that any of the detectives have worked with any Federal officer, or that the union has any interest in the National Guard other than that furnished by the fact that some of the guardsmen Mr. Diamond would have indicted and others he thinks are able to testify against those who are chargeable with violations of the law. The men the union would indict have so far not been named by Mr. Diamond, but it is believed that the campaign of retaliation is to be directed against John D. Rockefeller, Jr., and other "powers behind the throne."

Union Claims It "Framed" Itself

The United Mine Workers of America denies the force of the evidence obtained by the court of inquiry. It claims that the union officials knew that a raid was to be made on the offices of Major C. D. Elliott, one of the Mine Workers detectives. They accordingly placed a file of false correspondence for the express purpose of misleading the court; but the court in turn declares that this is only a futile effort to discredit the find.

Witnesses before the court have refused to testify, alleging that, the body being military, it has exceeded its authority in summoning civilian witnesses. Among these is Philip S. Van Cise, a former captain in the guard, but now chairman of the committee bringing charges against Adjutant-General John Chase and his lieutenants. Another recalcitrant is Major C. D. Elliott, former adjutant-general of the National Guard of Virginia and now "special agent" for the mine workers.

Van Cise was arrested by the court for refusal to testify. The governor immediately ordered his release pending the opinion of the attorney-general as to the court's jurisdiction in such matters. The latter stated that the court "should have the right" to summon witnesses, civilian or other, though it could not compel those it summoned to give testimony. Several subpœnas and one writ of attachment were issued forthwith. The latter was for the arrest of Major C. D. Elliott, but he had left for West Virginia. There is some talk of attempting to have him extradited.

R. W. Coates, chief of the numerous detectives in the employ of the United Mine Workers of America, has been subpœnaed, but habeas corpus proceedings will be instituted by the union should the court apprehend Coates, Elliott or Van Cise.

Van Cise declares that the charges brought by the committee were made solely in the interests of the state and for the betterment of the National Guard. He wants Chase ousted and a complete reorganization of the body for use in national defense only. He would have a state constabulary appointed to relieve the militia from service in industrial disturbances.

Editorials

Some New Aspects of the Anthracite Trade

The indications are that competition among anthracite shippers is going to be unusually keen this fall and winter. This is being brought about by the fact that many small mining operators who formerly sold their production to the larger mining companies are going into the market direct or changing over to some of the smaller sales companies. These changes have been making themselves felt all summer, and as the busy season comes on a still greater impression will be made.

There can be no denying that the individuals have grown and are equipped to offer both quality and service. They have been making their plans during the dull times and have been catering to the dealers, offering extra favorable prices and extended credits and giving appreciative attention to the smallest order. There is no doubt they have made many new friends.

Their sales forces are large enough to warrant weekly calls on all the trade, and because of this attention the smallest retail dealer has never been in such close touch with the market and in a position to ask more favorable terms.

The dealer who pays a price now without question is a thing of the past, and the feeling that the coal must be inferior on account of low price is also rapidly disappearing, for the very good reason that most coal reaching the market is being better prepared than ever before.

It goes almost without saying, though, that the big companies will make determined efforts to regain lost tonnage and also get new business. For this reason it will be interesting to note developments.

⁂

The Stresses in the Mine Roof

In this issue under the above title an article is reprinted extending the theory of roof demolition. In previous contributions to technical journals and societies the author of that article has kept in mind only the later stages of roof breakage and has overlooked the fact that when a tunnel is driven into a hill the roof is integral with the ribs, and the latter is a unit with the floor. He shows in this most recent publication that it is impossible to treat them apart in the same manner as we would the roof, the walls and the foundations of a house. They must continue to be treated as a whole until in the process of demolition they are parted.

Thus it appears there is a progression in the action of the mine roof which is marked by those rendings which the miner has long since ceased to fear but which are so trying if not terrifying to the tenderfoot.

It may be doubted whether the writer of the article is justified in adding to our already overloaded dictionary and in giving us a new meaning to the old word "pyoid." For holoid, "tunnel structure" would be a satisfactory equivalent; cumoid, could be safely translated into "plate" and a conchoid would be just as intelligibly described if designated as a "dome."

The idea of a pyoid is harder to convey by ordinary words than any of the others. It is hard to find a name which will not create more fallacious interpretations than true ones, unless we use some other word like "pylon," which is for the mining fraternity as hard to comprehend as pyoid and which is not a perfect analogue even then. Perhaps those who like our mother English as she was before the days of Lyly will prefer to call the pyoid an "n" structure, for after all an "n" is not so far removed in appearance from the actual condition.

However, coined words have their value, because they are supposed to convey only the ideas the coiner places on them. Strict etymologic truth is not demanded in making such names, and once coined they pass as if they were exactly specific, though like copper coins they fail to weigh enough as raw material to justify their recognized evaluation.

⁂

Unsettled Conditions in the Hard-Coal Business

While the individual anthracite operators market approximately one-third of the production, it is not customary for them to issue a price circular. In this respect they depend on the large companies which for years have issued circulars at regular intervals, and it is these circulars that the individual uses as a basis for his sales. When there is a brisk demand for coal it is not difficult to maintain the circular, but in times of a dull market extraordinary activity of some shippers to get their product to a market has a most disturbing influence on prices.

The one vulnerable spot, which has always been assailed by the individual, is the contract system of selling coal by the large operators. It has been the custom for many years to enter into contracts with extensive users of steam coal, covering their requirements for an entire year. In case the market price should fall below that agreed upon in the contract, the buyer without question receives the benefit of the falling market and when the price rises he is still protected. Furthermore, the buyer is not obligated to purchase the tonnage agreed upon in his contract. Violations of contracts have been especially numerous this year, the consumer buying from the individual at a lower figure than his contract. As a result the large companies have sat idly by and watched a large proportion of their steam tonnage drift away from them, and they now have large stocks of the steam sizes in storage.

It is not to be supposed that the large interests are entirely dormant; as a matter of fact, they have merely been tolerant. It is now rumored that one of the very largest companies has about decided to take a very aggressive stand in the matter of securing and holding their tonnage. It is hardly probable that the method to be pursued will be one of meeting fire with fire, as the big companies are too experienced to engage in a price war.

They could, of course, exert a tremendous power if they determined to right the market by a price-cutting campaign. Naturally, the cry would arise from the small shipper that the large producers were trying to eliminate him.

It is quite likely that aggressive action on the part of any of the larger companies has been delayed simply because of the many false impressions that would spread. Aside from this, the companies have been continually harassed by the Government during the past ten or fifteen years, with the end not yet in sight. Much of this opposition has been traceable to individual interests claiming to have been injured by alleged unfair practices.

If outward appearances count for anything, the individuals have prospered under the present system. Many companies which a few years since were occupying very little office space and had small forces to market their output are branching out by taking large suites of offices and employing new salesmen. It would seem to be wisdom on the part of the individual to realize that with his large aggregate tonnage there is a very great responsibility resting on his shoulders. It is regrettable that with the anthracite business hampered so much from without there should be so much friction from within.

⁂

The Trend of Conditions on New Contracts

The important contracts under consideration in the coastwise trade the past month have been the Boston & Maine R.R. locomotive supply and the Panama R.R. Co. The Boston & Maine contract (No. 1313, Vol. 8, p. 367) provides for 720,000 tons a year for one-year and five-year terms respectively, either f.o.b. loading port or delivered alongside Mystic Wharf, Boston, deliveries to begin on the expiration of present contracts, in August, 1916, and April, 1917.

At this writing no award has been made, but the conditions of the order are so unusual that they have caused considerable comment. It is recognized that there are only a few shippers, probably not more than three or four, who are likely to undertake business of that size so far ahead. The largest part of this tonnage is now furnished via Norfolk from the Clinch Valley region, and the trade is keen to see whether the present suppliers will be able to hold the order against interests that ship from the Fairmont and adjacent districts via Baltimore. The latter have been securing most of the New Haven business the past year, and the two railroads are of course closely associated.

The bids on the Panama R.R. Co. contract (No. 1327, Vol. 8, pp. 367 and 446) seemed to show the same purpose on the part of Hampton Roads shippers as on previous Government contracts the past year—to keep other coals out of the running. Two bids of $2.60 f.o.b. Philadelphia on Cambria County coal would have had to be seriously considered had not 400,000 tons of Pocahontas been offered at the same figure at Norfolk.

So low a price would be surprising, in view of admitted prospects for fall and winter trade and a possible labor disturbance in the spring, were it not for the fact that most of the demand is expected to come from the export market, and that those shippers who are credited with heavy tonnages offshore either quoted considerably higher or did not bid at all. Compared with last year's bids on the same contract (Nov. 24, 1914, Vol. 6, pp. 814, 854, 892, 933 and 1048), the low Pocahontas price is 10c. less and that on Cambria coal 8c. less. The Panama R.R. Co. therefore will probably buy its supply at an average price materially less than last season.

In the Philadelphia market the contract trade is extremely dull, the only business offering being 600 tons of anthracite buckwheat, asked for by the Philadelphia County Prison, and the United States Government contract at Wilmington, Del., for supplying 3000 tons of bituminous coal for use in channel work for Philadelphia Harbor. While the prices on the latter contract are not yet available, it can be definitely said that the bituminous interests are not anxious to accept any business at a figure less than the market price.

⁂

Should Coal Cost More?

Would it benefit the people of the world if the price of coal should be universally raised 50 or 100 per cent.? From one angle it appears as though such a thing should be done.

In the early days of the steam engine the cost of power was enormously high despite the cheapness of fuel. The apparatus in those days was decidedly inefficient, and the first cost of machinery was extremely high. That is one reason why there was so little machinery in use.

With the increase in the cost of coal came more efficient machinery—so much more efficient, in fact, that power became cheaper per kilowatt-hour at the switchboard than it had been before. The very slight increase in the price of coal in recent years is logical enough. Practically all prices of life's necessities have gone higher. And inasmuch as coal is gradually becoming more difficult to mine, its cost should increase.

On the other hand, our scientists are studiously plodding along in their laboratories, cheapening our power for us. Perhaps they are doing as much as they can right now, and perhaps not—who knows? If we should suddenly increase the cost of coal, thus imposing a "peak load" on our scientific friends, wouldn't it stimulate them to such concentrated effort that within a few months they would again bring the cost of power lower than it is today? It looks as though that is exactly what would occur. The scientists need a stimulus. They are a little ahead of the game now, so why should they worry so long as the operator is willing to be the goat?

There is no question but that even now, with our unprecedented knowledge of coal and power, coal is being criminally wasted. Dr. Rudolph Diesel has shown that a thermal efficiency of close to 50 per cent. is a practical possibility with the use of oil as a fuel.

In the early days of his work he proposed injecting a mixture of coal and oil into his engine, but it seems he did not succeed in making a success of such practice.

Perhaps somebody will do it some day, or perhaps somebody will accomplish the same thing in a different way. It may be that in years to come a 50-per cent. thermal efficiency with coal as a fuel will be a common event. In that case we will only burn from 5 to 20 per cent. as much coal as we are now consuming.

⁂

The Oct. 2 issue of *Coal Age* will be devoted to "Safety in Mining" and we invite our readers to send us articles on this subject.

Valley View First-Aid Meet

SYNOPSIS—The Pennsylvania Coal Co. and the Hillside Coal and Iron Co. held their tenth annual contest on Aug. 28. These companies were pioneers in the holding of such contests in America.

Evidencing a remarkable increase in efficiency, all the 18 teams competing in the tenth annual first-aid contests of the Pennsylvania Coal Co. and the Hillside Coal and Iron Co. at Valley View Park, Inkerman, on Aug. 28, attained general averages of over 91 per cent. in the three-problem contest for the Capt. W. A. May Cup.

A drizzling rain that broke about noon and continued at intervals chilled the spectators and doubtless kept many people away, but despite the weather conditions more than a thousand persons witnessed the contests and showed a lively interest in the demonstrations.

The Pennsylvania and Hillside companies were pioneers in fostering this great work in the United States a full decade ago and have kept up the excellent work by holding the annual intercompany contests. Dr. F. F. Arndt, of Scranton, Penn., has for several years been in charge of the first-aid work of the two companies. During the winter months he instructs the different colliery teams and in the early summer holds district contests, to select the most efficient teams to compete in the intercompany meeting, of which also he has charge.

Year by year, with the extension of the work, the expertness of the men has become more pronounced, and the general efficiency that has been attained in this the tenth year, is so close to perfection that surgeons and first-aid authorities declare that the treatment of accident cases by the companies' first-aid teams leaves little to be desired. With the growth in expertness the tests at the first-aid contests have grown more difficult, and the problems now being given are extremely exacting.

MAY CUP GOES TO NO. 8 SHAFT AND NO. 9 BREAKER

The chief award in the contest was a year's possession of the Capt. W. A. May Cup, the handsome trophy donated by the president of the companies. To secure permanent possession it is necessary for a team to win the trophy three times. A former cup was won for the third time by the Law shaft team of the Avoca district in 1911. The present trophy has not been won twice by any single team.

THE PENNSYLVANIA COAL CO. AND THE HILLSIDE COAL AND IRON CO. HOLD THEIR HISTORIC MEET THIS YEAR IN THE DRIZZLING RAIN

The company officials have carefully fostered their first-aid work. To increase individual expertness, a one-man or individual contest was instituted in 1913 for the best operators in the different districts. Gold watches and other valuable prizes were given to the winners A year ago a social atmosphere was lent to the annual event by the presence of a band to furnish music for dancing, and this year another diversion was an athletic program, with a varied list of events, including some novelties, for the employees and their families. The closing of the mines converted the affair into a general outing, and many families spent the day at the park.

This year the cup contest consisted of three full-team events. Each team was composed of five operators and a subject. Three problems, touching different phases of first-aid work, were given. Making a general average of 98⅓ per cent., the No. 8 shaft team and the breaker team of No. 9 colliery, North Pittston district, Pennsylvania Coal Co., tied for first position. As the two teams are from the same colliery, the tie was not broken. The remarkable and significant feature is that not a competing team made a lower average than 91⅓.

The winning teams were composed of the following members:

No. 8 Shaft—James Hopkins, captain; Michael Dunn, Peter Bedford, Richard Lynch, Michael Hoban; Joseph Barrett, subject.

No. 9 Breaker—Thomas E. Ross, captain; Luther Heal, John E. Miller, Max Melcher, Harold Herbert; Floyd Ramage, subject. Of this team, Ross and Heal have both won the individual events in other contests.

The averages made by the teams follow:

SCORES OF TEAMS IN FIRST-AID CONTEST

	Problem			General
	1	2	3	Average
No. 8 shaft, No. 9 colliery	100	100	95	98⅓
No. 9 breaker	95	100	100	98⅓
Clark slope, Avoca	100	96	98	98
No. 2 shaft, Old Forge	100	96	95	97
No. 2 shaft, Forest City	100	95	95	96⅔
Checker vein, No. 14 colliery	98	93	98	96⅓
No. 2 shaft, No. 1 colliery	100	93	95	96
No. 5 shaft, No. 5 colliery	95	95	98	96
Central breaker	95	93	100	96
Erie colliery, Mayfield	96	93	96	95
No. 6 shaft, No. 6 colliery	93	96	95	94⅔
Underwood colliery	93	93	96	94
Courtright slope, No. 14 colliery	95	92	95	94
Gray slope, Forest City	88	100	94	94
No. 5 shaft, No. 6 colliery	90	100	91	93⅔
No. 1 shaft, No. 9 colliery	85	93	96	91⅓

The problems were divided into three parts, one covering the treatment of wounds and bleeding, another the handling of burns, scalds, sprains and dislocations and the third the splinting and bandaging of fractures, simple and compound.

The individual contest brought together the pick of the experts of the region. The six contestants were given the following problem to solve: Apply a double-crossed bandage to the jaw of the victim and dress a wound on the front of the chin. Control bleeding in a case where the right arm has been cut off within 2-in. of the summit of the shoulder. Show how to control bleeding where the left arm has been cut off 6 in. above the wrist. Show how to control bleeding where the right foot is cut off at the instep. Bandage the left foot, leg, thigh and left groin.

After the demonstration the judges put the contestants separately through an oral examination on the problem and on first-aid work generally, the oral test ranking equally with the demonstration. A remarkable commentary on the excellence of the work is furnished by the fact that Clement Farrell, of Mayfield, aged 22, made a perfect score in both the physical and oral examination. He was awarded a handsome gold watch.

The other contestants made the following scores: William Creedon, Avoca, 96⅓, Alexander Tait, North Pittston, 92; Harry G. Jones, Forest City, 91; William Tewksbury, Dunmore, 85⅔; Peter Hoolihan, South Pittston, 80⅔.

BUT LITTLE OF THE PATIENT'S ANATOMY ESCAPED THE BANDAGE

The officials of the meet were: Director, Dr. F. F. Arndt; timer, Edgar C. Weichel; recorder, F. D. Conover; judges, Dr. F. J. Bishop, Dr. W. E. Keller and Dr. W. G. Fulton. The committee consisted of C. H. Frederick, chairman; W. P. Jennings, H. T. McMillan, F. H. Wright, J. P. Jennings and F. H. Coughlin.

The crowd thronged the athletic field to witness the athletic contests. The Pennsylvania Coal Co. won the tug-of-war in which the foremen and assistant foremen of the two companies were pitted against each other, and the strongest employees of the two companies tugged manfully. Other results were: Putting the shot, William McGuire, 36 ft. 10 in.; pipe race, Michael Hoban; fat man's race, George Parry; boys' race, tie between Frederick Llewellyn and Jacob Nagle; standing broad jump, Chester Adams, 9 ft. 2 in.; three-legged race, Max Nelson and John Tischler, first; egg race for ladies, Mrs. John Huffsmith; boys' race under 17, Victor Valerious; 220-yd. dash, Chester Adams.

O. W. Wintermute, physical director of the Pittston Young Men's Christian Association, directed the athletic events.

⁂

Old Company's Annual Meet

SYNOPSIS—The Lehigh Coal and Navigation Co.'s meet covered not only first-aid but land and water sports. A sparring match with heavily padded gloves was an interesting feature. The different districts competed for supremacy in aquatics and athletics and for the possession of a champion trophy, just as they competed there and have in other places for leadership in first-aid and for the ownership of a cup.

The third annual outing and first-aid contest of the coal-mining department of the Lehigh Coal and Navigation Co. occurred at Lakeside, about 6 mi. from Tamaqua, Penn., on Saturday, Aug. 28, and notwithstanding the efforts of the Weather Bureau to dampen the ardor of the contestants and spectators, a series of contests in first-aid and sports was held which will long be remembered as the most successful and enjoyable ever arranged by the company.

A special train starting from Lansford at 8 a.m. gathered up the participants from the Panther Valley, approximately 750 altogether, and reached Lakeside at 9 a.m. Immediately on leaving the train the participants, led by an excellent brass band composed of Slavic employees of the company, formed a line of march to the field where the first-aid contests were to be held, and no time was lost in getting to work.

In the first-aid contests 27 teams participated. For some time previous these corps had had special training in 20 different problems, from which five were chosen by lot just before the contests began, and the teams were not advised as to the problems to be presented until they were announced by megaphone as each event was to be contested. The problems drawn for the contest were:

One-Man Event—Dress a simple fracture of the lower jaw and a gash on the left leg over the knee. Time, 4 min.

Two-Man Event—Dress frostbites of both ears and both hands. Time, 4 min. This problem was introduced for the first time into a first-aid mine contest.

Full-Team Events—Dress a compound fracture of the right thigh and laceration of the scalp on a line from the forehead to the base of the skull. Time, 8 min.

Dress a compound fracture of the left leg and a simple fracture of the right collar-bone. Time, 8 min.

Treat conditions of man overcome by gas, with burns on head, neck, upper chest, forearms and hands. Give artificial respiration for 1 min. Treat for shock. Dress burns. Time, 8 min.

In these and in the 4-min. events several of the teams completed the treatment of the subject in about half the time allowed. The celerity with which the work was performed, as well as the perfection of the job itself, testified to the enthusiasm of the men and the excellence of their training.

The three winning teams were (1) the outside employees of Lansford district, Alexander Gibson, captain, with a score of 98.4 out of a possible 100, the special prize being $25 in gold to the team and a silver medal with his name engraved thereon to each of its individual members; (2) employees at Nesquehoning shaft, Fred Heffler, captain, with a score of 97.6 points, the prize being $15 in gold; (3) employees of the electrical department, Thomas F. Whildin, captain, with a score of 97.4 points, the prize being $10 in gold.

In the 1914 contest the first prize was won by the outside employees at Nesquehoning, the second by the electrical department and the third by the Lansford shops.

Of the 27 teams competing for the prizes, 6 were from the Nesquehoning district, 5 from Lansford, 5 from Coaldale and 7 from Greenwood. These district groups of teams also competed for a cup trophy presented by the company, the prize being awarded to the district having the best general average in the first-aid contests. The Hauto washery, Lansford shops and electrical-department teams are excluded from this competition. The cup is held for one year by the district winning it until one district has won it three times, when it becomes the property of that district. Coaldale district, with a general average of 95.3, wins the cup for 1915, Lansford and Nesquehoning being nearly tied for second place with 93.8 and 93.6, respectively.

WATER SPORTS IN THE PARK LAKE

Immediately after the completion of the first-aid contests the spectators and contestants moved to the lake shore, where, after a sandwich luncheon, the water sports began. These consisted of two swimming and two rowing contests, in which the four districts competed. Both swimming contests were won by William Barry, of Greenwood district. The single-oar boat race was won by H. Houser, of Coaldale district, and the double-oar race by W. Miller and L. Hiles, of Nesquehoning district.

After the water sports were finished and before the field sports began, a bountiful and excellent dinner, under the direction of Edward Petzel, steward of the Old Company's Club at Lansford, was served in the grove, and though most of the guests not provided with raincoats or umbrellas were by this time fairly wet to the skin, there was little lacking in enthusiasm or appetite, and ample justice was done to the feast. Steward Petzel says he never saw a hungrier lot of "boys."

BOXING CONTEST FOR POINTS

An unusual and particularly appreciated event introduced at this outing as a diversion just preceding the field sports was a boxing contest with soft gloves. This consisted of three bouts, two of a preliminary character, between representatives of the four districts, and a final bout of six rounds, in which the winner was given a prize of $20 in gold and the loser a consolation prize of $10. The boxing contests provoked as much enthusiasm as any of the events, though no points were given to the winner on the general sports' score.

Up to this time the weather conditions had been about as unpropitious as they could be. The sky had been overcast from the early morning and a chill easterly wind had brought rain just as the march to the first-aid trials began. Fortunately, however, the rain, though chill, particularly to the "patients," whose attire was necessarily scanty, was not heavy enough at any one time to interfere with the program or to send the spectators to cover. During the afternoon when the field sports were being held the weather conditions were more favorable, the rain clouds withdrawing for a time as though showing more sympathy with the athletic than with the first-aid contests.

ATHLETIC CONTESTS COMPLETED MEET

The field sports consisted of running races, standing and running jumps, potato races, putting the shot and the tug-of-war. The winners of first place in both field and water sports were given 6 points. Those who won second place were credited with 4 points, those securing third place were awarded 2½ points, while those placed fourth were given only 1 point. In the tug-of-war, however, the winning team was given 10 points. The trophy for the field sports is also a silver cup, and the same rule obtains as to its awarding as governs that offered for competition in the first-aid contests. The winner this year was Greenwood, with a total of 54 points, the decision resting upon the result of the tug-of-war, with its 10 points, which was won by the Greenwood district. The points made by the other districts were, in order: Lansford, 47.5; Nesquehoning, 35.5; Coaldale, 17.

The individual winners in these events were as follows: 50-yd. dash for 50-yr.-old men, won by A. Haughton, of Lansford district, time 7 sec.; 100-yd. dash, won by George Jones, of Nesquehoning, time 10 sec.; 220-yd. dash, won by same; standing jump, won by Joe Leckitas, of Greenwood district, 9.65 ft.; running jump, won by William Richards, of Lansford district, 18.8 ft.; potato race, won by William Richards; putting 16-lb. shot, won by William Brennan, of Lansford district, 30.7 ft.

Wentz Allied Companies' Meet

The Wentz Allied Companies include the Midvalley Coal Co., at Wilburton, Penn.; J. S. Wentz & Co., at Hazle Brook, Penn., Upper Lehigh Coal Co. at Upper Lehigh, Penn., and the Maryd Coal Co., at a town of the same name, also in Pennsylvania.

These corporations held their second annual first-aid meet and field meet at Hazle Park, Hazleton, on Friday, Aug. 27. The weather was not by any means propitious but though conditions were threatening, the program was not revised.

Twelve teams of adults competed for the prizes, which were a silver trophy cup for the leading team and $25 in gold for the second team. The breaker boys, who had three teams in the meet, competed for a prize of $5 in gold. The Upper Lehigh teams were successful in landing the cup and money prizes, the first going to the No. 2 team and the second to the No. 1 team of that colliery. The management of the companies was so well pleased with the showing of the breaker-boy teams that they were all given a prize of $5 in gold. The problems were as follows:

One-Man Event—Leg crushed off below knee; stop bleeding and dress stump.

Two-Man Event—A man has his arm caught in a machine, by which it is torn off completely and pulled out of the socket at the shoulder joint. Control hemorrhage and dress the wound. State to the judges what was your first method and what your final method of stopping the flow of blood; state also your final disposition of the injured man. Time, 10 min.

Three-Man Event—Right ankle dislocated, compound fracture of the lower third of the same leg, with arterial bleeding. Time, 10 min.

Four-Man Event—A man, overcome by heat, falls and fractures his skull. Resuscitate and dress fracture. Time, 6 min.

Full-Team Events—(1) Dislocation of the spine. Simple fracture of the left arm and forearm. Time, 15 min. (2) A miner is caught by flying coal from a shot which was supposed to have missed fire. The right side of his face is badly cut, his right eye is blown out, he sustains a simple fracture of the right thigh, and three of his lower ribs on the left side are broken. Time, 18 min.

Triangular bandages were used in solving all problems as stipulated in the rules. The contest was close, the teams being all of about equal ability. The judges were strict in their oral examination of the captains, and each team was closely questioned as to the method pursued in treating the various injuries.

The judges were: Dr. Biddle, of Fountain Springs; Dr. J. M. Maurer, of Shamokin, surgeon of the Susquehanna Coal Co. in that territory; Dr. D. H. Lake, of Kingston, surgeon of the Delaware, Lackawanna & Western R.R. Co.'s collieries; Dr. Robert Gaughan, assistant surgeon at the Hazleton State Hospital. Dr. Montelius, of Mt. Carmel, was starter. Messrs. Ward and Kotch of the companies were the scorers.

After the contest the men and invited guests, totaling in all 400 persons, were invited by the company to a dinner spread under the trees in the park. After dinner a baseball game and shooting match completed the entertainment.

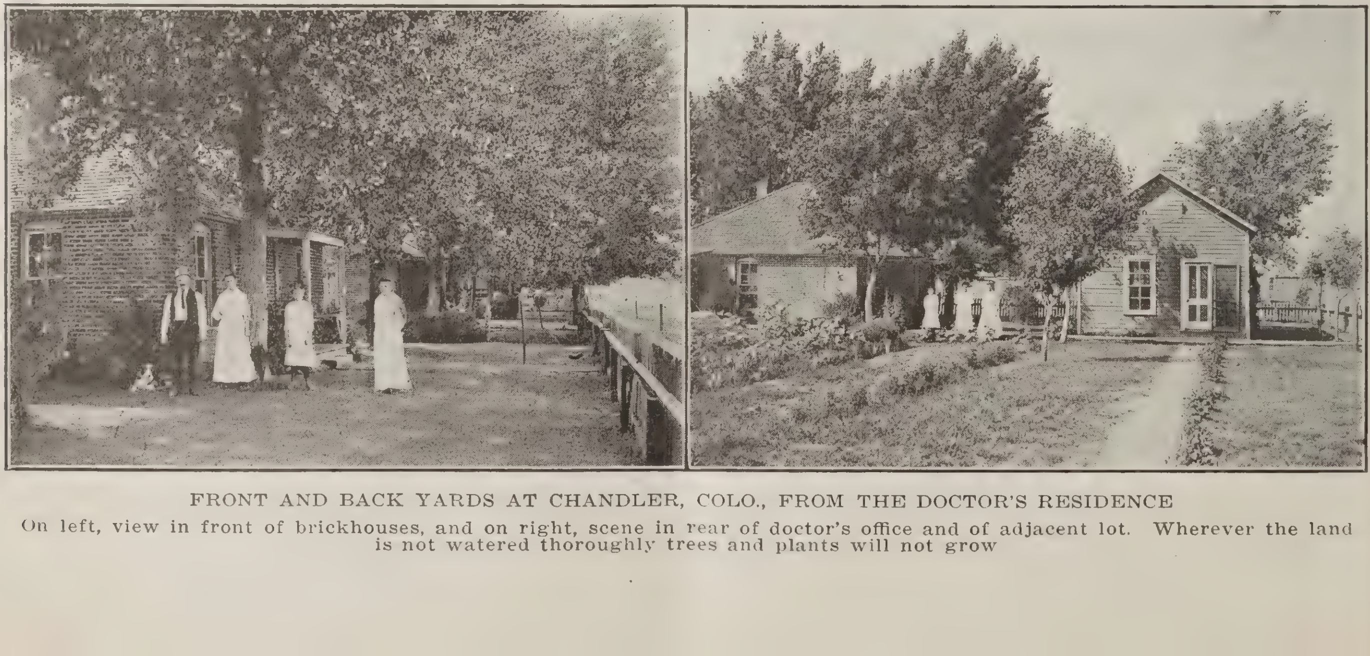
Victor-American Fuel Co.'s Garden Contest

By C. S. Taylor*

The Colorado division of the Victor-American Fuel Co. held its third annual contest for lawns, flower gardens and vegetable patches the latter part of July of this year.

In every mining town where the company has interests and where sufficient water is available for irrigation three cash prizes are awarded, consisting of $25, $15 and $10 each,

THE JAPANESE BOARDING HOUSE AT DELAGUA HAD A GORGEOUS DISPLAY AND TOOK FIRST PRIZE



FRONT AND BACK YARDS AT CHANDLER, COLO., FROM THE DOCTOR'S RESIDENCE

On left, view in front of brickhouses, and on right, scene in rear of doctor's office and of adjacent lot. Wherever the land is not watered thoroughly trees and plants will not grow for the best yards, whether they are planted to grass, flowers or vegetables.

---

*2044 Ash St., Denver, Colo.

The only conditons imposed are that there be three or more contestants in each town, and that those participating in the contest be bona-fide residents of the place and employees of the Victor-American Fuel Co.

The mine superintendent, surgeon and clerk are excluded from participation in the awards, although these three individuals have always received a liberal amount of praise from the judges in making their rounds. Disinterested parties residing in some neighboring town are selected for the judicatory board.

AUGUST HUTTER RECEIVED FIRST PRIZE AT CHANDLER FOR HIS PRETTY GARDEN

Each year an improvement is noticeable over the work of previous years. More are participating each year and the standard is raised as time passes.

The following awards were made:

Delagua—First prize, $25, J. M. Kawahata, Japanese Hotel; second prize, $15, John Ban; third prize, $10, Carr Robson. Judges: Charles Epstein and A. A. Bennett.

Hastings—First prize, $25, Mrs. Elizabeth Roberts; second prize, $15, W. S. Krause; third prize, $10, W. M. Cunningham. Judges: Charles Epstein and A. A. Bennett.

Chandler—First prize, $25, August Hutter; second prize, $15, Joseph Charis; third prize, $10, C. H. Smith. Judges: John Shaw, Hunter Palmer and H. Galley.

Ravenwood—First prize, $25, William Smith; second prize, $25, divided among B. Pastoria, John Happa and Joe Watson. Judge: S. M. Andrews.

At Ravenwood there were three contestants who had exactly the same percentage, so it was decided to amalgamate second and third prizes of $15 and $10 respectively, giving each of the three contestants an equal share.

Contest at Knoxville, Iowa

By H. C. Austin*

SYNOPSIS—First-aid work makes slow but sure progress in Iowa, and is being steadily fostered by the labor unions. The meet at Knoxville in Marion County was attended by only three teams.

Compared with her sister states, Iowa in general may seem to lack enthusiasm in first-aid work. Yet the Des Moines first-aid contest and several minor events since may fairly be deemed to show that a campaign has been started in that state which can hardly fail to be successful, should the contests in the future interest both the mining fraternity and those in other walks of life as did the contest held at Knoxville.

This event was held as an additional attraction at the Labor Day celebration of that town. The contest was inaugurated more for its educational value to the community than for any other purpose, and it served its purpose well, judging from the remarks and comments made by the spectators. The majority stopped to see what was going on purely from curiosity, but stayed to the end of the contest intensely interested and amazed to see the work done by the first-aid teams.

The contest was under the general supervision of Sam Ballantyne, vice-president of District No. 13 of the United Mine Workers of America, who with great skill "ran off" the meet without a "hitch" in the proceedings.

A MINING COUNTY WITHOUT A FIRST-AID TEAM

Knoxville is the administrative seat of Marion County; but while there are several important operating mines in that political division none of them has a first-aid team, so all the contestants came from other counties in the state. The personnel of the teams was as follows:

The Seevers Team of the Colfax Consolidated Coal Co. from Seevers, Iowa—Noah Barker, captain; Evan James, Russell Williams, Frank Willey and Fred Dickey. The Buxton Team of the Consolidated Coal Co., Buxton, Iowa—G. D. Yancy, captain; Allen Staten, James Gillette, G. W. Broots, William Phillips and Fred Coleman. The Hocking Team of the Hocking Coal Co., Hocking, Iowa—J. G. Henwood, captain; Clyde McDonald, John Wilson, William Chemington, Sam Oudrens and Ed Thorpe.

The last-mentioned team took first prize in the Des Moines meet this spring and also contested at the Kansas City meet of recent date, where only by reason of a misunderstanding they failed to be awarded the trip to the Panama-Pacific International Exposition.

NONE BUT FULL-TEAM EVENTS WERE CONTESTED

Three problems were worked out, which were selected by Mr. Ballantyne from a list of five, all of them being full-team events. They were as follows:

Man found with broken back. Prepare patient for removal and stand in an upright position. Time, 12 min.

Miner caught between loaded cars. Rib and right shoulder blade broken; left arm broken 3 in. below elbow; left foot crushed; cut on right cheek. Improvise stretcher and carry 50 ft. Time, 12 min.

Simple fracture of right thigh; fifth and sixth ribs on left side broken; compound fracture of right wrist; bright-red blood issuing. Improvise stretcher and carry patient 50 ft. Time, 11 min.

The first event was the most closely contested, all the teams averaging above 90, as follows: Seevers team, 96 per cent.; Buxton team, 94, and Hocking team, 91.

The second event seemed to give the most trouble, the difficulty being not so much in technique as in minor matters. The Buxton team bandaged the wrong arm. The Hocking team seemed to be somewhat nervous in that event and was penalized for not having sufficient material on hand, also for awkwardness, slowness and the faulty directions of the captain.

However, that team made up for these lapses in the last event, in which it made a perfect score. The Buxton team again fell down rather badly, suffering a 13-point penalty. The Seevers team was deliberate, methodical and consistent throughout, only losing 16 points in the three events, the final score being as follows: Seevers, $94\frac{2}{3}$; Hocking, $93\frac{1}{3}$; Buxton, $86\frac{1}{3}$.

Drs. Connell, Ames and Wright, all of Knoxville, were the judges. Dr. A. E. Reiter and H. C. Austin were score-keepers and Senator Clarkson, of Albia, acted as timekeeper.

The contest was witnessed by approximately a thousand people. The crowd as a whole, was either bent on pleasure, or had not felt hitherto any interest in work of this character, but that so many turned aside to view the contest shows that the exhibit did much to advance the progress of first-aid in Iowa.

◆

Montana Hoisting Engineers—Employment of operators of electric and air hoisting engines used in lowering or hoisting men is regulated by a law adopted at the recent session of the Montana legislature. Section 1 makes it unlawful for an unlicensed person to operate such an engine of more than 25 hp., subject to the same exception in emergencies that is made by the revised codes of the state concerning the employment of unlicensed operators of steam engines and boilers. Sections 2 and 3 provide for issuance and revocation of licenses by the state boiler inspector and authorize persons who hold first-class licenses for operation of steam engines and boilers to operate electric and air hoists without the license prescribed by the new law. Section 4 divides the licenses into two classes, the first being limited to applicants who have had three years' experience or more in operating electric or air hoists and authorizing operation of any such hoist and the second class being limited to applicants with at least two years' experience and forbidding operation of a hoisting engine of more than 100 hp. Section 7 makes it a misdemeanor for an unlicensed person to operate any of the machinery covered by the act or for an owner or manager to employ any such unlicensed person.

Discussion by Readers

Responsibility of Miners

Letter No. 1—In my experience of 25 years in coal and metal mining, during which time I have endeavored to make a close study of mining conditions, I do not recall anything that has so aroused to action all mine operators and officials as the great "Safety-First" movement has done. There can be no question but that the measures adopted by these operators and officials have warded off many accidents and saved lives. But what has been done in this direction only leads one to ask, Why have these efforts put forth so earnestly not accomplished more than they have? The problem is not easily solved, but there are three reasons that, when well considered, speak volumes. I will refer to these separately and briefly.

First, the newspaper press and many news agencies seem to take special delight in assailing the great coal companies of our country, with the result that they have educated the average miner to believe that these companies are directly and wholly responsible for the safety of their employees in the mine. This idea has taken so large a possession of the minds of the general miner that he has come to feel no personal responsibility for his own safety while in the mine. He believes that it is the company's place and duty to take care of him. Many a time the miner knows what he should do for his own safety and yet puts off doing the work until he is instructed to do it by the mine foreman or his assistant.

On this account, while mine officials have made great advances in the direction of safety, miners as a class have retrograded along this line. Not many years ago little attention was given by the operator to the question of making the mine safe, but his chief thought and effort were devoted to increasing his profit. The safety of his employees was not a matter of his concern. Today the first consideration in all uptodate mines is the safety of the men employed. Formerly the miner had to work single handed for his own safety. Now, how much more could be accomplished if the miner would coöperate with his employer in matters of safety and realize his own personal responsibility in this matter? The miner must remember that no one but himself can exercise the constant vigilance and care needed to avoid the unseen and often unexpected dangers that surround him while at work.

Second, the present-day tendency of the miner is to shorten his hours of work and increase his daily output of coal. In his haste to do this and load his turn of cars, he gives little attention to the safety of his surroundings and neglects or postpones to do what his better judgment would tell him is necessary in order to make his place safe. This rush to load coal not only affects the miner but urges the drivers to the same recklessness and disregard of safety in their efforts to supply the turn of cars.

Third, few will deny that there is prominent in many mining towns a spirit of recklessness. There can be no question but that this spirit is destructive of all that pertains to personal safety and the security of property. I believe that much depends on the earnest efforts of coal companies to repress this spirit of reckless bearing among its employees. I believe that this should be made a feature of the work in the safety movement. Much could be accomplished in this regard if a certain portion of the money spent for increased safety could be devoted to the development of the church life and work in the community in mining towns. In the associations of the church, men are led to regard life as sacred and are impressed with a seriousness in regard to death. This leads them to a fuller realization of danger and the exercise of greater care and caution in their daily work.

These three causes, as I have said before, speak volumes and furnish much food for thought. They deserve careful consideration in our efforts to make mines safer.

⁂

Labor in Mining

Letter No. 9—Referring to the article of Josiah Keely, *Coal Age,* Aug. 21, p. 294, in which he discusses the question, "Why are strikes at coal mines of such frequent occurrence?," I desire to offer a few comments, which should not be regarded as criticising any of Mr. Keely's statements, but merely expressing my own opinion on this subject.

It would seem that Mr. Keely's statements refer mostly to conditions in our own state of West Virginia. There are, no doubt, many reasons for the present unrest; but, in my opinion, the chief reason is the enmity that has existed for a number of years between employers and their employees. The feeling may not be as strong today as formerly, but it cannot be said to be eliminated. Up to a few years ago, as is well known, certain coal operators had the upper hand in their own counties and in the state. In one instance an operator was styled "king" of the county, where he not only ruled the mines with an iron hand but controlled the whole political machine, which he had built up in that county. His ruling days came to an end, however; but in leaving he could not take with him the hatred he had generated in the miners.

I am happy to say that conditions are not the same today, though all mining districts in the state are not alike. There are fields that always had more or less trouble before they were unionized, but the trouble increased when they became organized as a union. There are other fields where no union exists, and trouble is almost a stranger, although it cannot be said that the working and living conditions are quite so good there as in the other fields. The reason for this is that the mines are smaller operations and the owners come into closer touch with their men, whom they strive to treat fairly, as far as their limited means permit.

The miners working in these smaller operations have not been oppressed as those in the larger fields, where the owners of the mines are hardly known. The mines in those fields were largely in charge of a superintendent, who had nothing at stake but his position and was determined to be boss as long as he lasted. He often overstepped his rights, not only in the mines and during working hours, but in the social life of the camp. I do not mean to say that there were not some good officials among them, but they were in the minority. Neither do I mean to suggest that a mine official can be given too much power as long as he uses it with discretion.

It often happens that a superintendent who has made good in one field, on changing to another field, discovers that he must change his ways of dealing with the men. A superintendent will often misjudge his man, as in one case, when that official remarked, "Mike is a good loader; there is none better in the mine; but he wants to be jollied along." Now, I will say that if Mike comes out and asks for more props he doesn't want to be "jollied," he wants props. He may not say much when he gets a jollying instead of the props; but as the Irishman said of his parrot, "He don't talk much, but he is a bugger to think." Mike will take the jollying for a time, but some day he will explode, and the explosion will bring out of the mine all the other Mikes. Then the management wonders and asks, "Why are strikes at coal mines of such frequent occurrence?"

I have referred to the prop question only as an illustration. It is a trivial matter that is easily adjusted if attended to in time; but there are other trivial matters that are too often "jollied" down instead of being met fairly and squarely, and satisfaction given before they become real grievances.

Every mine official should be able to command the respect of his subordinates, and likewise the respect of every worker in the mine. But in order to do this he must be thoughtful and study the situation as it is. Should the field be unionized, he should try not to allow his mind to become prejudiced against such a condition, but endeavor to establish good terms between himself and the union. In that case, should trouble arise, the miners will surely see him before throwing down their tools and going out on a strike.

In every case, miners should be made to feel that they will be given justice. Should they be in the wrong, the superintendent should talk over the matter with them as man to man. It may happen that there are some black sheep, but the effort must be made to overbalance their influence among the men. The superintendent must remember that miners have the same right to organize as the operators in whose mines they are employed.

Operators, not only in West Virginia but everywhere else, would do well to study the system of one of the largest coal companies in the state of Wyoming. The management has to contend with Greeks and Japs, in addition to all the other nationalities that frequent our coal fields. The field is organized and it is doubtful whether the company would desire to return to the open-shop system. They encourage the union in every possible way, with the result that most of the men are satisfied and contented. They see to it that their committees are composed of the most liberal-minded men in the camp.

Now observe how, under these conditions, troubles in the mine work out in a reasonable way. Suppose, for instance, a motorman, timberman or trackman, so minded, aims to do as little work as possible for the time he puts in. There is surely a miner who is inconvenienced in his working place because of this man's shiftless ways, and the fellow is soon reported to a mine committee, which promptly takes up the matter with the guilty one and gives him a chance to mend his ways or submit to having his case called to the attention of the foreman or superintendent. The union motto in that camp seems to be, "A fair day's work for a fair day's pay." It is understood that every man must work so as to do justice to the company, the union and himself. That kind of union almost eliminates the type of man who insists on getting daywork inside of the mine, where he can lose an hour in the morning and be hunting for it the rest of the day.

It is good to notice, however, that there are many signs which show that West Virginia is coming to the front, her natural place in coal mining. The violence that has dominated the early union is fast being replaced by the order that characterizes the modern union. False leaders and agitators are beginning to find that the rank and file of the miners will not be led to repudiate their contracts and indulge in violence and disorder.

C. J. FUETTER.

Logan, W. Va.

Efficient Mine Foremen

Letter No. 3—Let me first ask the question, What is a mine foreman? I would answer: A mine foreman is the man who is held responsible for everything that happens in the mine, which may mean the loss of a life, or the cost per ton of coal produced, or anything that may come between these two items. He is the man whom the mining department holds responsible for the carrying out of the mining law under penalty of imprisonment or fine. The mine superintendent expects him to deliver the coal to the tipple at the very lowest cost. The employees expect him to adjust all their grievances, whether real or imaginary. If he fails to do this to their entire satisfaction he is at once pounced on by the officials of the miners' union. Again, he is never sure of the position he holds. At any time the superintendent or the operating company may become dissatisfied with him and, as a result, he must go. There is no one to whom he may appeal, and he finds himself, on very short notice, without work. Hence, we can see that this is not the best of positions to occupy.

Let us now see what a man must be before he can prove efficient as a mine foreman. He must be a man who is strictly sober and also honest, one that will refuse to take a gift however small from any of the workmen. He must be a man that has the confidence of all who work under him, one that can keep cool in any emergency and teach others to do the same. He must be energetic in his studies and keep up with the ever-changing conditions of mining. He must understand the theory as well as the practice of mining. It will be better for him if he has worked up from a trapper boy or driver.

He must be able to render first-aid treatment to an injured man, no matter how serious an accident may occur. He should be a man who can pass an examination, proving to the state mining department that he understands all the state laws of mining; can work out various problems in ventilation; knows the properties of the various gases met with in coal mining; is able to attend to the drainage of the mine and has a good practical knowledge of electricity. He must at all times carefully watch the ventilation of the mine and measure the air current as prescribed by law. If he finds it sluggish, he should at once ascertain the cause, which will probably prove to be a fall in the air course, a broken-down stopping or an open door, and proceed at once to remedy the trouble.

In mines generating firedamp the foreman must see that all persons are out of the mine before permitting the fan to be slowed down or stopped for repairs. His motto should always be (1) the safety of everyone under his care, (2) the safety of the company's property, (3) cost of operation. Some companies appear to have reversed these items. He must be a man who has the force of his own convictions, be able to say "No" and strictly adhere to his decisions, having first made sure that he was right. He must, as nearly as possible, carry out the mining law to the letter. He must be a man of original ideas, but never feel himself too big to take advice, even if it comes from a coal digger.

To review more fully some of these qualifications, it may seem strange to many readers of *Coal Age*, but there are mine foremen who have few of the qualities mentioned. Such a man holds his job simply because he can get out the coal at a reasonable cost by bullying the motormen or the drivers, as the case may be. He does this more readily if they are foreigners. His other responsibilities are taken care of by his assistants. This can only happen in a state where the mine foremen do not have to pass an examination.

Again, there are mine foremen who are quite up to the standard and have all the above-named qualifications. A man who is strictly sober is most likely to succeed, because he can keep clear of the traps that are set by the wary miner for the mine foreman who takes a drink once in a while. It is a well-known fact that when a miner gives anything to the boss he always expects a great deal more in return. There are various ways to gain the confidence of the men. Treat them as you would like to be treated yourself; help them in any way you can. This may mean assisting a man to put a car on the track, lending a hand to put up a cross-timber, helping a man to charge a hole, or helping to do any other little thing that a mine foreman may come across during his daily examination of the working places. These acts are not much in themselves, but they go a long way toward gaining the confidence of the men. First-aid should be understood and practiced by every mine official, both inside and out of the mine. How ridiculous a mine foreman looks when an accident occurs and he is not able to give the proper aid.

Some superintendents appear to like the idea of cutting down the mine foreman's order for supplies each month. In that case the efficiency of the foreman is greatly curtailed. No sensible-minded man will pass in an order for supplies that he does not need. Recovery of rails, ties and posts from abandoned workings is done by careful foremen as soon as the workings are finished. If this is not done the material is lost altogether or recovered later only at an unnecessary expense to the company. In conclusion, the foreman must work hand in hand with his men, the mining department and his superintendent if he would prove himself to be an efficient mine foreman.

Mine Boss.

——, Ohio.

Stopping Payroll Leaks

Letter No. 7—I was much interested in reading the several letters in regard to stopping payroll leaks. The last one, Letter No. 7, by C. J. Fuetter, *Coal Age*, Aug. 7, p. 227, impressed me particularly.

In this letter Mr. Fuetter points out the loss that occurs when the bonding of the rails in an electric haulage system underground is left in charge of a mine foreman who gives the matter no thought or care. The reason is often because the mine foreman desires to make a record for himself by cutting down his cost-sheet, not caring, as Mr. Fuetter suggests, that he is thereby creating a much heavier expense in the powerhouse, the blame for which he knows quite well will be laid to another man's charge and he will escape.

It stands to reason that the greatest success can be obtained in mining operations, only when every man works in the company's interest and considers that above everything else. It is up to the operator to discover the foreman who is trying to make a record for himself by piling up expense on someone else. Such a foreman will always leave the mine in a worse condition than he found it when he assumed charge. While we cannot expect every mine foreman to be a mining engineer or an electrician, we may expect mine operators and superintendents to see that the work is so divided among the different department heads that it will be performed intelligently and with the least expense of time, labor and money. Such a division of the work would require that all electrical equipment shall be under the supervision of a competent electrician. In other words, the entire work of the mine should be classified and put in charge of those who understand its performance.

The suggestion that friction would result from the electrician having charge of rail-bonding underground, because of a supposed conflict of authority between him and the mine foreman, will not apply if both of these men understand that the success of one means the success of all and that the failure of one means the failure of all. If this is true the only thing that remains to be done is to coöperate, each man working to the advantage of the other. By so doing he serves the best interest of the company and, incidentally, advances his own interest by reducing the general expense and making the work of mining more successful.

There is perhaps no one feature that increases the expense of operation to a greater extent than the lack of harmony and coöperation on the part of employees, especially the heads of different departments of the work. It often happens that jealousy arises between two department heads, and as a result they pull against each other and strive continually to find ways in which they can work to the other's disadvantage. At times we find a superintendent who encourages this spirit, calling it "competition." In my opinion, it is not competition, but should be regarded as a "trouble breeder." In the end it will bring disaster to the hopes and ambitions of one or both of the parties concerned. A jealous spirit breeds discontent. To illustrate, I want to recite briefly one instance that came under my observation:

At a certain mine, the inside foreman in charge had worked up from a driver to his present position. In the same company, the store manager came from a business college where he obtained his education. The trouble began when Mrs. Store Manager discovered that Mrs. Foreman was born and reared in a mining camp, and promptly cut her acquaintance, with the result that Mr. Store Manager soon discovered that Mr. Foreman had formerly driven a mule and, indeed, dug coal for a living. The gap thus opened widened rapidly, and the store manager found opportunity to disparage the work of the foreman by making some of the miners believe that the foreman had reported short time for them. The foreman retaliated in short order by stopping certain of the men from going into the mine, because they had been detained at the store when buying their oil and were a few minutes behind the time for starting work. To make a long story short, both men lost their positions, as a result of their personal controversy. Both of these men were well fitted for the positions they occupied, but they did not coöperate, and instead of creating harmony they preferred discord. In their efforts to discredit each other they delayed the work and injured themselves. One of the principles of all successful business is the harmony and mutual good-will of everyone concerned. What is the good for one is the good for all.

Before closing I want to mention one other point where loss to the company results. I refer now to waste of material taken into the mine. A dozen cross-bars are sent into the mine, and part of them are used, while the remaining two or three are thrown to the side of the road and forgotten or covered with refuse and lost. When more timber is needed another lot is ordered from the surface. Frequently, longer timber is sent down than is ordered or can be used. The miner saws off the ends of the sticks and throws them back in the waste when these could often be split up for cap pieces. The same waste occurs in rails, ties, car-wheels, track-splices and spikes, brattice cloth, and many tools. This all means a great loss when summed up for the year. I knew of one mine that maintained a storage track in a place 18 ft. wide, where all left-over material was taken and stored, and this material was used from time to time as needed.

As to the suggestion made in Letter No. 5, July 10, p. 61, to the effect that money spent at the right time and in the right way will often save a great expense at some later period, it is up to the foreman to determine what is necessary and where he can save future expense and avoid loss of coal, by doing certain work at the right time. The company pays its foreman for certain knowledge on his part, and he must always study the conditions carefully.

Assistant Foreman.

Bevier, Ky.

Study Course in Coal Mining

By J. T. Beard

The Coal Age Pocket Book

Area of Triangles—The area of a triangle is equal to one-half the product of its base and altitude. In this sense, any side of a triangle may be taken as its **base** and the **altitude** is then the line drawn from the apex of the opposite angle perpendicular to the base or the base extended.

In a **right triangle,** one of the sides about the right angle is generally considered the base and the other is then the altitude. Hence, the area of a right triangle is one-half the product of its two sides.

In finding the area of triangles other than right triangles, it is generally necessary to first calculate the altitude separately. In the two following cases, however, the area of the triangle can be found directly by the formulas given:

1. When two sides and the included angle are given:

$$Area = \tfrac{1}{2}\,(ab \sin C)$$

2. When one side and any two angles are given, it is then possible to find the third angle by subtracting the sum of those given from 180 deg. and apply the formula

$$Area = \frac{a^2 \sin B \sin C}{2 \sin A}$$

Example—(a) Find the area of a triangular field when two of its sides measure 600 and 450 ft., respectively, and the angle between them is 30 deg. (b) Find the area of the same field, when the given parts are: a = 600 ft.; B = 46° 56′ and C = 30°.

Solution—(a) Sin 30° = 0.5; hence the area of the field is

$$Area = \tfrac{1}{2}\,(600 \times 450 \times 0.5) = 67{,}500\ sq.ft.$$

(b) The third angle, not given, is A = 180° — (46° 56′ + 30°) = 103° 04′; and the known parts are

$$\begin{aligned} a &= 600 \\ Sin\ A &= \sin 103^\circ 04' = \sin 76^\circ 56' = 0.97411 \\ Sin\ B &= \sin\ 46^\circ 56' = 0.73056 \\ Sin\ C &= \sin\ 30^\circ = 0.5 \end{aligned}$$

Hence, the required area of the field is

$$Area = \frac{600^2 \times 0.73056 \times 0.5}{2 \times 0.97411} = 67{,}500\ sq.ft.$$

Quadrilaterals—The quadrilaterals, or four-sided polygons, include rectangles, parallelograms, trapezoids and trapeziums. The area of the first two of these classes is equal to the product of the base and altitude.

The area of a **square** is the square of one side.

The area of a **rectangle** is the product of two adjacent sides, one being the base and the other the altitude.

The area of a **parallelogram** is the product of one of its parallel sides, called the "base," and the perpendicular distance between them, called the "altitude."

The area of a **trapezoid** is the product of the half-sum of its parallel sides and the perpendicular distance between them. The longer of the two parallel sides is the base and the perpendicular distance the altitude.

The Coal Age Pocket Book

The area of a **trapezium** is found by drawing a diagonal between two opposite angles, thus dividing the trapezium into two triangles, the sum of whose areas is equal to the required area of the trapezium.

Regular Polygons—The solution of regular polygons is based on the following formulas:

Let a = area of polygon;
o = perimeter of polygon;
l = length of one side;
n = number of sides;
R = radius of circumscribing circle;
r = radius of inscribing circle;
α = angle at center subtending one side.

Then, by the principles of geometry,

Central angle, $\alpha = 360/n$ (1)

Side, $s = 2\,R \sin(\tfrac{1}{2}\alpha) = 2\,r \tan(\tfrac{1}{2}\alpha)$ (2)

Perimeter, $o = ns = 2\,nR \sin(\tfrac{1}{2}\alpha)$
$= 2\,nr \tan(\tfrac{1}{2}\alpha)$ (3)

Area, $a = \tfrac{1}{2}\,ro = nr^2 \tan(\tfrac{1}{2}\alpha)$
$= nR^2 \sin\cos(\tfrac{1}{2}\alpha)$
$[\sin\cos(\tfrac{1}{2}\alpha) = \tfrac{1}{2}\sin\alpha]$ $= \tfrac{1}{2}\,nR^2 \sin\alpha$ (4)

Circumscribing radius, $R = \dfrac{s}{2\sin(\frac{1}{2}\alpha)} = \sqrt{\dfrac{2\,a}{n \sin\alpha}}$

Inscribing radius, $r = \dfrac{s}{2\tan(\frac{1}{2}\alpha)} = \sqrt{\dfrac{a}{n \tan(\frac{1}{2}\alpha)}}$
$= R\cos(\tfrac{1}{2}\alpha)$

Note—The radius of the circumscribing circle furnishes the means of locating graphically the center of the polygon, which lies at the intersection of the arcs described by this radius from the apices of the polygon as centers.

Example—Find the central angle subtended by one side, the length of a side, the perimeter and area of a regular pentagon inscribed in a circle whose diameter is 50 ft.; also the radius of the inscribed circle.

Solution—A regular pentagon is a plane figure having five equal sides and angles. Then, since the radius of the circumscribing circle, in this case, is R = ½ × 50 = 25 ft., we have

Central angle, $\alpha = 360 \div 5 = 72\ deg.$

Length of one side, $s = 2 \times 25 \sin 36^\circ = 50 \times 0.5878 = 29.39\ ft.$

Perimeter, $o = 5 \times 29.39 = 146.95\ ft.$

Area, $a = \tfrac{1}{2} \times 5 \times 25^2 \sin 72^\circ$
$= 1562.5 \times 0.95106 = 1486+\ sq.ft.$

Inscribing radius, $r = 25 \cos 36^\circ = 25 \times 0.809 = 20.225\ ft.$

Inquiries of General Interest

Sampling Shipments of Coal

I read with much interest the questions of R. T. M., and the reply thereto, in regard to "Standards in Analyzing Coal," *Coal Age*. Aug. 28, p. 353. This prompted me to inquire further whether the United States Government engineers have ever adopted a standard method of sampling shipments of coal, which of course is the first and most important step to determine its quality and fuel value. Since the consumer is not interested in knowing what the coal analyzes by taking a straight-cut sample from the coal in place, it would seem that the proper method to adopt, so far as he is concerned, would be to sample the coal after it has been loaded for shipment. I do not believe that a fair sample can be obtained by driving a pipe through the coal from top to bottom, or by cutting a channel on top of the load the full length of the car, or by collecting a sample here and there from the top of the car.

SUBSCRIBER.

Gallitzin, Penn.

In Technical Paper 76, entitled "Notes on the Sampling and Analysis of Coal," by A. C. Fieldner, the Bureau of Mines, in addition to explaining in detail its method of collecting samples from the mine, discusses "The Relation of Mine Samples to Commercial Shipments." On page 13 the author states: "In drawing deductions from the mine-sample analysis, in regard to the quality of coal shipped from the mine, due allowance must be made for the larger proportion of impurities that may be included in the commercial operation of the mine."

It is generally recognized that in the mining, handling and loading of the coal for shipment it is practically impossible to prevent the inclusion of more or less foreign matter, and the author of Technical Paper 76 concludes that the mine-sample analysis, therefore, usually indicates a better grade of coal in respect to the ash content and heating value of the coal than is true of the commercial shipments.

Bulletin 63 of the Bureau of Mines, entitled "Sampling Coal Deliveries," draws attention to the same difference between mine sampling and the sampling of commercial shipments. In the purchase of coal for the Government it was recognized that the specification should include a definite commercial procedure in sampling shipments; and as a result of a conference the method adopted was outlined and included in the printed specifications.

The details of this method of sampling are given on pages 56 and 57 of the same bulletin. This consisted, practically, of taking shovelfuls from the shipment while being unloaded. Thus, small increments of from 10 to 30 lb. were taken at regular intervals during the time of unloading, so that a gross sample of 1000 lb. was obtained. This gross sample consisted of small and large sizes, and was later crushed and reduced in the usual manner to a convenient sample for laboratory use. In the case of large-sized lumps a gross sample of 1500 lb. or more was taken. But the specifications state that for slack coal and for small sizes of anthracite, if the impurities do not exist in abnormal quantity or in size larger than ¾ in., a gross sample of about 600 lb. is sufficient.

⁂

Starting an Electric Motor

There is a question that I would like to see discussed or answered in *Coal Age:* Assuming an electric haulage locomotive of 500 volts capacity is standing with the controller wide open and that while in this position the trolley pole is raised to the wire, will the armature be burned out as a result? We all know that the instructions are to first see that the controller is closed, so that no current can pass, before raising the trolley pole to the wire. Then, when the trolley pole is in position and you desire to start the motor, open the controller gradually, passing it from point to point as the motor gains speed. While I have seen armatures burned out under conditions similar to those mentioned, I have never been able to satisfy myself fully as to the cause.

T. W. ENGLISH.

Oliphant Furnace, Penn.

If the controller is wide open when the trolley pole is brought in contact with the wire, there will be a sudden rush of current greater than that which the armature is designed to carry, and as a consequence the armature would then be burned out.

When current from the trolley wire passes through the armature, it meets with a certain resistance due to the resistance of the winding. If the current passing generates a torque greater than that required to overcome the friction of the journals and revolves the armature, there is at once created an electromotive force that is opposed to that transmitting the current. This "counter-electromotive force," as it is called, acts as an additional resistance to the revolution of the armature and reduces the torque. Therefore, to maintain the speed of revolution, more current must be supplied to the armature.

As the speed of revolution is increased, the counter-electromotive force also increases, and as a result, when a uniform speed of revolution has been attained, there is a resistance due to the counter-electromotive force that the current flowing through the armature must overcome in addition to the resistance in the winding. In other words, the torque required to overcome the frictional resistance of the journals and revolve the armature at a uniform speed is reduced by the counter-electromotive force set up in the field.

Now, it will be readily understood that if the entire current is permitted to pass through the armature by bringing the trolley in contact with the wire when the controller is wide open, there is no counter-electromotive force present; and—the resistance opposing the flow of the current through the armature being much less—a greater current flows through the winding than the carrying capacity of the wire will permit and a burn-out results.

Examination Questions

Tennessee Examination for Mine Foremen, Assistant Foremen and Firebosses

(Selected Questions)

Ques.—You have a wide room that is generating a considerable amount of marsh gas at the face. You decide to temporarily ventilate this room by a line of brattice, which you can run up either side of the room, but which can reach only to within 15 or 20 ft. of the face, on account of the shooting tearing it down. If the brattice is put on the right side of the room, the air will be intake behind the brattice and return in the room. If it is put on the left side, the air will be intake in the room and return behind the brattice. There is enough air, in either case, to dilute the gas so that the return will be harmless. On which side of the room would it be best to erect this brattice, in order to keep the room most clear of gas? State your reasons.

Ans.—The brattice should be erected on the right side of the room, so that the intake air will be carried up behind the brattice. The air current will then be directed with greater force against the face and will sweep the entire face of the room, which is important in order to prevent any accumulation of gas in the corners of the room where the air does not strike. Again, if the brattice was to be erected on the left side of the room so as to conduct the return current out of the room, its area would require to be much larger than before, because of the increased volume of the return current, due to the presence of the gas. Also, there would be danger that much of the gas would eddy where it should enter the brattice on the return side. This condition could not occur if the brattice were erected on the right side of the room and there would then be less danger of gas accumulating in the room back a distance from the face, as when the entire room is swept by the return air. It is assumed that the wide room mentioned in this question is a double stall with the waste thrown back in the center of the room, there being a roadway on each side. The brattice is necessary here because the waste does not completely fill the space to the roof and the air does not reach the face.

Ques.—Referring to the last question, if you had succeeded in keeping the room clear of gas and a bad fall should occur in the face of the room, the roof falling so high that a quantity of gas continued to hang above the fall ahead of the line of brattice, how would you proceed to keep the space clear over the fall?

Ans.—It is difficult to answer this question without knowing the exact situation. However, in general, it may be said that in order to sweep the gas from above the fall, it will be necessary to erect a special form of brattice that will direct the current over the fall in such a manner as to carry away the gas.

Ques.—Explain what you understand by a "windy shot." What are the usual reasons or conditions that may produce such a shot?

Ans.—A "windy shot" is one that produces a more or less heavy concussion of the air so that it is felt at a considerable distance from the place where the shot is fired. A windy shot may result from an overcharge of powder, which causes the rupture of the coal before all of the powder has been burned. As a consequence, the powder remaining unburned when rupture takes place is largely exploded in the mine air. Practically the same thing may result with a normal charge of powder when the coal has been weakened or creviced by undue roof pressure or by the explosion of a previous shot. In that case much of the force of the shot is expended on the mine air as before. Under these conditions there often results what is known as a "squealer," this name being suggested by the shrill sound produced by the gases escaping through the crevices when the shot is fired.

A windy shot is not apt to be as dangerous as a blownout shot under the same conditions, because the heat and force developed are much less in the former case. A blownout shot is one in which the shot has blown its tamping without breaking the coal. In this case the flame and gases of the shot are projected from the hole with great force. A blownout shot may arise from a variety of causes, but is most frequently due to a "tight shot" where the charge is laid too deeply on the solid, or the shot is bound by projecting tops or bottoms in such a way that the powder cannot break down the coal. A blownout shot may be due to insufficient tamping or too large a diameter of hole for the charge of powder employed, in which case the force of the exploding powder is not sufficiently distributed in the coal to produce rupture, owing to the concentration of the charge.

Ques.—(a) About what velocity of air would you consider advisable in the main air courses, in order that the current shall be able to keep the working faces clear of gas, but so that fine dust will not be carried in suspension in the current or that there shall not be an excessive amount of friction? (b) What should be the sectional area of the airways in order to maintain this velocity and supply the above-mentioned amount of air? State the width and height of the airways.

Ans.—(a) The velocity of the main air current may vary from, say, 600 to 1000 ft. per min., without causing undue danger from the carrying of dust in suspension in the air. The velocity in any particular case, however, will depend on the conditions existing in the mine with respect to the fineness and the amount of dust present. On the other hand, as stated in the answer to the previous question, the air volume required for the entire mine will depend on the number of splits and the velocity required at the working face.

(b) Assuming, however, a total air volume of, say, 60,000 cu.ft. per min., the required sectional area of the main airway will vary from 100 sq.ft. for a velocity of 600 ft. per min. to 60 sq.ft. for a velocity of 1000 ft. per min., depending on the conditions as previously stated. These velocities of the air current will not produce an excessive amount of frictional resistance.

Coal and Coke News

Washington, D. C.

A phase of the recent coal decisions of the Interstate Commerce Commission that has thus far received comparatively little attention, but is likely to figure a good deal in the discussion of the situation is found in the data compiled to show the real freight revenue yielded to the anthracite coal roads from their coal business. Probably the work done by the Commerce Commission on this phase of the matter is as elaborate and detailed as, if not more so than, any other element of its inquiries.

The Commission takes as a basis of comparison in the matter of revenue the showing of revenue made by 69 carriers in the recent "five per cent. case" and presents an extensive compilation of the income derived from various items of freight by these carriers as follows (carload lots being taken as the basis of computation):

Article	Average Net Income per Loaded Car-Mile, Cents
Hemlock lumber	28
Hides	24
Brick, stone, etc.	22
Iron ores	20
Cement (in sacks)	22
Pulp wood	13
Sheep	7
Cattle	6
Hogs	7
Corn syrup	6

The foregoing is merely a selection of some of the highest and some of the lowest yields obtained from various commodities in a large group, results for which are presented by the Commission. With this representative showing for the commodities transported by the 69 well-known carriers taken as a basis may be compared the figures for the coal roads showing their revenue per loaded car-mile on all sizes of coal averaged.

Road (to Tidewater)	Rev. per Loaded Car-Mile, Cents
Pa. Ry. & Northern Central Ry.	23.07
N. Y., O. & W.	23.86
Reading	25.70
Erie lines	31.64
Lackawanna	32.86
Lehigh Valley	34.94
Jersey Central	41.05

To Buffalo (instead of tidewater) the net revenues are lower but were still substantial, most of them being well above 20c. Comparing the results with those for the 69 carriers above referred to, it is seen that the incomes on anthracite coal rank with the highest from any other commodity. In fact there is no road that presents a net revenue on anthracite coal, as indicated by these figures that is not materially above the great majority of the revenues for various commodities reported by the 69 carriers referred to as an average.

Further, as the Commission clearly shows, the present mode of hauling anthracite is in trains that transport the maximum train tonnage. Large tonnages hauled in these trains mean very high revenues per train-mile. Some of the figures compiled by the Commission to show comparative train-mile revenue may be stated as follows:

Road	Freight Revenue per Train-Mile
A. C. L. RR. Co.	$2.696
B. & O. R.R. Co.	3.474
C. & O. Ry. Co.	3.471
L. & N. R.R. Co.	2.295
N. Y. C. & H. R. RR. Co.	3.028
Virginian Ry. Co.	4.567
U. S. roads, as a whole	3.0228

As against this the Commission states that the revenue on anthracite coal earned from the mines to tidewater is per train-mile $19.30 for the Jersey Central; $16.14 for the Lehigh Valley; and $16.43 for the Lackawanna.

It has been suggested in some quarters that these figures are vitiated by the fact that the work of the anthracite coal roads is not confined to the hauling of anthracite but includes a large amount of other articles. How much weight must be given to this argument may be judged from a computation of data given by the Commission in an appendix and showing the proporation of total traffic over the coal roads furnished by the anthracite coal. Some of these figures are given as follows:

Road	Ratio of Coal to Total Tonnage, Per Cent.	Ratio of Coal to Total Freight Revenue, Per Cent.
Central RR. of N. J.	31.5	46
Phila. & Reading	24.4	32.6
D., L. & W.	41.9	49.8
Del. & Hudson	44.8	49
Lehigh Valley	45.5	50.5
N. Y., O. & W. Ry.	70.2	63.6
Wilkes-Barre & Eastern	80.9	85.9
N. Y., Susquehanna & Western	64.7	48.6

This shows the proportion of total operations in which anthracite coal figured and consequently indicates in some degree the extent to which the higher revenues carried on coal are characteristic of the general business of the coal lines.

Allowance is not made in the foregoing figures for the return movement of empty coal cars, the anthracite traffic being peculiar in that it is largely a one-way business. The inclusion of the empty movement makes a change in the mileage revenue returns but leaves them substantial, as may be seen from the following comparison:

Road	Revenue per Loaded Car-Mile, Cents	Revenue per Car-Mile, Including Empty Movement, Cents
Pennsylvania	23.07	11.56
Ont. & Western	23.86	11.96
Reading	25.70	12.85
Erie	31.64	16.41
Lackananna	32.86	17.72
Lehigh Valley	34.94	18.29
Jersey Central	41.05	21.22

From this showing the conclusion drawn by the Commission is that the returns drawn by the carriers from their movement of anthracite are "remunerative."

Improvements at Panama

Advices from the Isthmus show that material improvement is being made in methods of handling coal at Panama. A project has been approved by which several berths at the commercial piers at each terminus will be fitted with booms for using the conveyors in unloading cars into ships' bunkers. The four conveyors now in service are used on barges and bunker vessels at dock from the offshore side, and the new equipment will make it practicable to bunker vessels from both sides while they are discharging cargo. It is proposed to install two conveyors on both sides of Pier 8 at Cristobal, two on the front of wharf No. 9 and two on each side of Pier 7 when constructed. They will unload from a special type of car consisting of a Lidgerwood flat car built up with 5-ft. sides and ends, forming a compartment 38 ft. long which will hold from 45 to 50 tons of coal.

Dating from Sept. 1 the price of coal has been increased to $6 per ton at Cristobal and $7 per ton at Balboa.

HARRISBURG, PENN.

Preliminaries to the organization of the workmen's compensation system for Pennsylvania were arranged recently at a conference of the members of the new Workmen's Compensation Board and state officials with Attorney General Brown.

Harry A. Mackey, Philadelphia; J. W. Beech, Ebensburg, and John A. Scott, Indiana are the members of the Compensation Board and Insurance Commissioner Johnson, State Treasurer Young and Commissioner of Labor and Industry Jackson comprise the Insurance Board.

The organization of the insurance fund, for whose administration the state made an appropriation of $300,000 will be first. It will be laid out as soon as possible and men familiar with insurance matters will be placed in charge of various features. It is probable that within a few weeks the making of schedules, establishment of premiums and other details will be under way.

One interesting feature of the state's insurance fund will be an elaborate system of advertising of its advantages. This will be done through Smull's Legislative Hand Book, which will devote six pages to the fund, through folders and by placing of matter in envelopes sent on state business. The fund itself will be created out of the premiums paid by employees. The state will pay the expenses.

Part of the plan is to have men stationed in various cities of the state in charge of branch headquarters for business for the fund and these men will visit employers and explain the merits of the state system. According to inquiries made, several liability companies will be formed and some of the existing companies will also go after business of insuring employers.

PENNSYLVANIA

Anthracite

Mahanoy City—The Philadelphia & Reading Coal & Iron Co., through President W. J. Richards, of Pottsville, has donated to the people of Gilberton a strip of ground to be utilized as a playground for the children. The company is also furnishing teams and implements for placing the site in shape.

Scranton—Under a contract granted by the state, the Drake Drilling Co., of Hazleton, has begun the work of saving the state armory from destruction by mine caves. Settlings in the workings beneath the building two months ago allowed the foundation walls and sides to crack and little can be done to remodel the building until new foundations are placed on solid ground. Concrete pillars are to take the place of the present foundation walls and allowance will be made for further settling of the surface.

Pottsville—A coal case 43 years old was decided recently by the Schuylkill County Court. The decision gives the Lawrence Colliery Co. the right to remove all the coal under the tracks of the Reading railway company on the Mahanoy Plane, where the coal is hoisted over the mountain, providing some other support for the surface is provided. It releases coal estimated to be worth $1,000,000. The suit was originally brought in 1872 against Lawrence, Merkel & Kerr. When the partnership was dissolved the case was continued against Lawrence & Brown, the present owners. The questions were decided by lower and Supreme Courts at the time and in 1873 another case was started. Evidence was taken before C. F. Shibe, the master, 13 years later, but he died before rendering a decision, being followed by F. W. Bechtel, who also died before deciding the case. Then ex-Congressman J. B. Reilly was appointed, and his work of the last several years was approved by the court on Sept. 6. In making the decision the court found it necessary to review 8,000 typewritten pages of evidence.

Summit Hill—Steam issuing from a point near the concrete wall erected by the Lehigh Coal & Navigation Co. to check the fire which has been burning for upwards of 60 years, indicates that the progress of the fire is now such as to determine whether or not it is going to be checked by the barrier erected for that purpose. For over a year stripping operations have been going on near the wall and the work is now being prosecuted with such energy that about 300 cars of coal are being taken out daily. Great hopes are entertained that the fire will not pass the wall, but if it does it is thought that the stripping operations have progressed to a point where the fire may be extinguished. This fire has cost the company several millions of dollars in coal and the efforts to check it.

Bituminous

Blairsville—Coal operators about Tunnelton, White and Foster are looking for men. While men for all classes of work are wanted the crying need is for miners. Italians, Lithuanians, Austrians, Hungarians and other foreigners, whose governments are at war, have quietly disappeared from this territory and none have come to fill their places. Several mines in Josephine are now rushed with export coal orders which must be filled in a stipulated time. In Clearfield, Clarion and Westmoreland Counties 2,500 miners and an additional 1,500 laborers can find employment in the coal mines and wages are today better than for years. Export orders for quick delivery are now coming from all parts of the globe, especially for steam coal, but many coal operators, it is reported, are compelled to refuse them on account of shortage of men.

Connellsville—A cargo of 5,800 tons of coke, manufactured by the Consolidated Connellsville Coke Co., was shipped recently to private interests in Italy. The sale was made through jobbers so the manufacturers do not know the real consignees. The Tower Hill plant No. 2 is being put in first class running order as is also Thompson No. 2 plant. The Rainey interests are gradually adding more ovens at their Allison plants. The Orient plant has been placed in running order and is waiting the price which it is felt will come before putting the ovens in full. Altogether conditions for the latter quarter of the year are very good with extraordinarily flattering prospects for the workers and merchants of the community.

Scottdale—Word has been received at the Scottdale offices of the H. C. Frick Coke Co., that the awards have been officially fixed by the superior jury of the Panama-Pacific International Exposition to cover the exhibits of the United States Steel Corporation and its subsidiary companies and among these awards is one to the H. C. Frick Coke Co., as follows: Medal of honor for combined exhibit including a model of a modern coal and coke plant, relief map of the Connellsville region and 9 ft. channel section representing thickness of coal seam, also samples of coal from mines. Also for five simple cubes showing character of coal from the mines of the U. S. Coal & Coke Co., the Bunsen Coal Co., and the National Mining Co.

California—The Vesta Coal Co., at its Washington County, Penn., plant will shortly begin the construction of what is said to be the longest mine siding in the world, now nearly three miles in length and which will be extended from the pit mouth a distance of over 5,000 ft. back into the hill. The construction of this siding is for the purpose of handling the coal on the tipple to better advantage. The track will accommodate the storage of more than 500 cars and will be double tracked, one track for loaded cars and the other for empties.

Uniontown—The existence of fires of threatening proportions in several of the abandoned mines of Fayette County, Penn., raises the question as to who is responsible for extinguishing them. Mine fires are never easy to extinguish and the bigger they are the heavier the undertaking becomes. Mine fires in this region have been known to burn for years in spite of continued efforts to quench the flames and the destruction wrought has not always been confined to the property of the mine owner, but has spread to adjoining properties. Most mine fires menace other property than that of the owners of the mine and there arises the question of public duty in such a case.

WEST VIRGINIA

Wheeling—Following an inspection by state officials, the mine of the Elm Grove Coal Co. was recently ordered closed. It is alleged that the mine is not properly wired, and several other changes have been recommended. This is one of the oldest mines in the Wheeling district.

Morgantown—The Mine Extension Department of the West Virginia University last year had one man doing field work. This year three men have been sent out, each having a certain district in which to work, including about five regular mine districts. These men will establish 10 points where demonstration classes will be conducted, each place being visited every two weeks. In many instances these classes will be conducted under the auspices of the Y. M. C. A. or organizations maintained by the coal company.

Coal operators of southern West Virginia assert that the increase in rates on coal shipments to points west of the Mississippi River will be highly injurious to the coal industry of this state. These operators favor concerted action to oppose such rates.

Thomas—The Davis Coal & Coke Co. will start its new plant near Bloomington within a few days. A boiler and power house have been erected on Savage River for the old Buxton mine. This plant will have a daily output of about 800 tons. Coal activities are increasing in the Fairmont field, and by the first of October it is believed that the coal business will be as brisk as it ever was in that section.

Powhatan—The coal tipple of the Powhatan Coal & Coke Co. was destroyed by fire late Sept. 8, resulting in a loss estimated at $35,000 to $40,000. The structure was insured. The origin of the fire has not yet been determined. Plans are being drawn to erect a modern steel tipple with the most modern machinery. Work will be resumed in a few days, a temporary chute being erected immediately for loading cars. Only run-of-mine coal, however, will be loaded by this means.

VIRGINIA

Bristol—Unusual activity is reported to exist in the coal-mining industry in eastern Kentucky and southwest Virginia. One coal mining company is advertising for 1,500 additional miners, while many coal-producing firms are making extensive improvements. It is believed that the movement of coal for export from this region will be heavy when the docks at Charleston are completed.

ALABAMA

Birmingham—The Sloss-Sheffield Steel & Iron Co. recently requested the City Commission for permission to light the coke ovens near its furnace. This matter was taken under advisement by the City Commission, and no definite action is expected for a few days.

KENTUCKY

Artemus—The Dean Coal Co., whose mines have been closed since last February, will reopen Oct. 1. They are operating in the Dean seam.

Sebree—The Jefferson County Bank, Birmingham, Ala., purchased the Sebree coal mines at a court sale recently for $8,880. The purchase will not affect the present management, the Sebree Mining Co., which will continue to operate the property under lease.

Paducah—A conference of western Kentucky coal operators and Illinois Central traffic officials was held here recently for the purpose of considering a proposed advance in freight rates to Jackson, Natchez, Vicksburg and other Mississippi Valley cities. It is asserted that the advance would give Alabama coal an advantage of 30c. in reaching the markets referred to, and would shut out western Kentucky coal. The operators will lay the case before the Interstate Commerce Commission.

OHIO

Steubenville—The plant of the Dexter Coal Co., near this city, which was equipped several years ago at a cost of $125,000, has been sold by the receiver under order of the United States district court to George C. Watt, of Braddock, Penn., at his bid of $9,100. The purchaser will operate the plant, it is announced.

Bellaire—All records were broken Sept. 9 at the Rail & River Mine No. 1 for a single day's output. Approximately 2560 tons of coal were delivered to the tipple, which is believed to be not only the record for this individual mine but also for the county.

St. Clairsville—Three coal miners recently filed suit against the Purseglove-Maher Coal Co. to recover wages claimed to be due them for work from Aug. 1 to 25. This is a test case and is the outgrowth of conditions arising during the strike when for a long period the employees of the coal company lived in the company's houses and dealt at the company's store becoming deeply indebted thereto. Instead of now paying the men their wages in cash, the company is giving them receipts for rental and grocery bills. The suit is filed on the ground that not more than 10 per cent. of the wages of a married man may be attached.

INDIANA

Boonville—The Hartwell Coal Co., operating in Pike County, Ind., is reported to have plans for resuming operations in the immediate future. The company controls 2,400 acres of coal lands.

ILLINOIS

Muncie—A suit has been filed in the circuit court by the Pocahontas-Winifrede Coal Co., of Huntington, W. Va., asking for the appointment of a receiver for the T. L. Westlick Coal Co.

Danville—The Illinois Central R.R. Co. recently filed in the Federal Court here a petition asking that a restraining order be directed against the Interstate Commerce Commission. This case is the outgrowth of the coal service in September, 1913, when the Groom Coal Co., the Vulcan Coal & Mining Co., and the St. Louis-Coulterville Coal Co., asked the Commission to assess damages against the railroad company. The railroad company asked that the case be tried in the court at once. The alleged shortage of cars in the coal district caused repeated complaints to be made to the State Service Commission and the Interstate Commerce Commission; the latter body finally began an inquiry.

Belleville—Thomas C. Wright, St. Clair County Mine Inspector, has filed his annual report. He says that the 69 mines in the county for the 12 months ending Aug. 31 produced 3,017,820 tons of coal, a decrease of 1,099,182 tons from the previous year. The total of men employed for the last year was 3,944 against 4,738 for the previous year. There were 34 non-fatal accidents in the year against 55 for the previous year. Five men were killed during the year. There are 36 shipping mines in the county but 17 of them did not operate because of business conditions in the district. The shipping mines under operation averaged 145 days during the year and the local mines 180 days.

COLORADO

Hayden—The Victor-American Fuel Co., which several months ago purchased a ranch near Hayden, Colo., is laying off a townsite there. It is near the coal tract adjoining the Harris mine.

Denver—The Victor-American Fuel Co. has filed with the secretary of Colorado a reservation of the name The Colorado Coal Co. It is said that the company wishes to hold the name for the purpose of using it in connection with a mine which it will open in the future.

Representatives of the coal companies of Colorado met recently with the state industrial commission to discuss the rate of insurance to be charged the coal operators under the Workmen's Compensation Act and other features of the law which concern the coal companies. The operators declared that a 7 per cent. insurance rate would put most of the small companies of the state out of business. S. M. Perry, president and general manager of the Leyden and Moffat coal companies stated that one of their mines would have to close immediately.

Durango—Federal Judge Trieber, sitting in the absence of Judge Robert E. Lewis at Denver, Colo., recently dismissed the indictments filed more than 8 years ago against the Porter Fuel Co. for alleged conspiracy and fraud in obtaining approximately 2,790 acres of rich coal lands near Durango in La Plata County. These lands now belong to the Union Pacific Coal Co. and are valued at more than $500,000. There has never been any question concerning conspiracy in relation to the Union Pacific Coal Co. This is one of the most famous cases ever tried in Denver.

FOREIGN NEWS

Vancouver, B. C.—Announcement was recently made that the Attorney-General of British Columbia had laid indictments for manslaughter against Thomas Graham and J. H. Tonkin, charging them with carelessness in connection with the disaster which caused the loss of 19 lives in the Reserve mine near Nanaimo on Feb. 15 last. Graham is Chief Inspector of Mines for the Provincial Government, while Tonkin is manager of the Pacific Coast Coal Co. A blast in the Reserve mine broke the barrier wall separating it from the old workings of the South Wellington mine, which had long been flooded with water. This break in the barrier caused the death of 19 miners by drowning.

PERSONALS

Edward H. Coxe, mining engineer, of Knoxville, Tenn., left recently for a trip to Denver and the coal fields of Routt County, Colo.

Thomas L. Lewis, former president of the United Mine Workers of America, is now a salaried employee of the West Virginia Coal Operators' Association, with an office in Charleston, W. Va.

J. R. Fleming, of Bear River, Routt County, Colo., has resigned his position as local manager for the Bear River Coal Co. of that place, and, as soon as his successor is appointed, will remove to Utah to look after coal interests that he has in that state.

David Reese, for many years connected with the Victor-American Fuel Co. at Hastings, has been appointed a member of the Colorado state board of coal mine examiners by Judge A. W. McHendrie, of the third judicial district, empowered by statute to appoint one member.

Benjamin B. Thayer, president of the Anaconda Copper Mining Co., and William L. Saunders, chairman of the board of directors of the Ingersoll-Rand Co., both members of the American Institute of Mining Engineers, have been appointed to the Naval Advisory Commission.

J. C. Roberts, of the U. S. Bureau of Mines, has had a corps of men working at the top of Pikes Peak, Colo., with appliances for mine rescue work. He has made a number of important and interesting tests in that high altitude, but is not ready yet to make his discoveries public.

L. W. Brown, superintendent of the Richland Coal Co. of South Warwood, W. Va., has left for Bolivia, South America, where he will open a tin mine for West Virginia capitalists. The tin deposits in question are 12,000 ft. above sea level, and a railroad is projected to reach these mines.

Perry Barker, fuel engineer, has opened an office and laboratories in the Oliver Bldg., 141 Milk St., Boston, Mass. He is equipped to be of service to both dealers and consumers and will make investigations, tests and reports on the preparation and use of coal and coke for various purposes.

Messrs. Joseph J. Keegan and Hilliard J. Rosencrantz are in charge as managing directors of the Far Eastern Division of Gaston, Williams & Wigmore, Inc., of 140 Broadway, New York City. This division has been organized and equipped to develop markets for American industries in the Orient.

C. E. Bullard, who has for the past four years been cashier of the Carter Coal Co. at Warren, Ky., has been promoted to the superintendency of the Carter Coal Co. at Anchor, Ky. Prior to his connection with the Carter company in Kentucky, Mr. Bullard was chief clerk to the general superintendent of the Virginia Pocahontas Coal Co. at Coalwood, W. Va.

W. W. Hall, who has been salesman for the George D. Whitcomb Co., of Rochelle, Ill., with office in the Blackstone Bldg., Ashland, Ky., has resigned his position with that firm and taken the sales management of the Ironton Engine Co., Ironton, Ohio, which company is going to manufacture a complete line of coal mining machinery, making a specialty of coal cutting and hauling machinery.

Herbert M. Wilson, director of the Department of Inspection and Safety of The Associated Insurance Companies, formerly of the Bureau of Mines, will be in San Francisco, Sept. 16 to 25, participating in the various engineering congresses. He will be actively concerned in the first-aid and mine-rescue demonstrations and contests of the Board of Managers, of which he is chairman. He is also scheduled to read papers on mine safety and on workmen's compensation before the mining sections of the International Engineering Congress, the American Mining Congress, and the World's Insurance Congress. Going to and coming from the Pacific Coast, Mr. Wilson will visit various coal mining states for the purpose of perfecting arrangements for inspection of mines for insurance by The Associated Companies under workmen's compensation.

OBITUARY

Louis Florien DeSaulles, 69 years of age, died at his home in Uniontown, Penn., Sept. 6, as the result of a bullet wound in the head, self inflicted. Mr. DeSaulles was born in New Orleans in 1846 and at the outbreak of the war young DeSaulles and his mother went to France where the mother still lives at Pau, being 98 years of age. At the close of the war Mr. DeSaulles returned to America and engaged in business and later came to this section of Pennsylvania where he became interested in the development of Fayette County coal. He and the late George Marshall and others opened one of the first coke plants in the county at Percy. This has long since been worked out and abandoned but many of the present day leaders in coal and coke operations in this section served their apprenticeships under Mr. DeSaulles when the plant at Percy was in its prime.

Ernest H. Abend, principal owner of the Abend coal mine, one mile north of Belleville, Ill., in which city he resided, was found dead recently at the bottom of a 150-ft. shaft in his mine. He was 54 years of age, wealthy and unmarried. The circumstances of his death are unknown. Two theories are advanced: One that he lost his balance while making an inspection; the other that he walked into the shaft after lifting the safety gate. The elevator was at the bottom of the shaft. Mr. Abend had gone to the mine, as had been his daily custom since the recent extraordinary rains, to inspect the work of the men operating the pumps. On reaching the mine he had a conference with Frank Oexner, his chief engineer, and left him to go into the mine. A few minutes later Foreman Martin Kirkwood, at work near the bottom of the elevator shaft, heard an object strike the elevator and upon examination found Mr. Abend's body.

INDUSTRIAL NEWS

Henrietta, Okla.—The Junior Coal Co. is installing a large Bucyrus steam shovel.

Henrietta, Okla.—The Fidelity Fuel Co. is planning to sink two new shafts in the near future.

Bellaire, Ohio—It is asserted that the Pittsburgh Vein Coal Operators' Association is considering the matter of moving its headquarters from Wheeling to Bellaire. It is believed that decisive action on this matter will be taken in the near future.

Springfield, Ill.—On Saturday, Oct. 2, an examination will be held at various towns in Illinois to fill several positions in Illinois Civil Service. Among these is a chief clerk of the Mining Board. This is open to men over 25 years of age and carries a salary of $125 to $175 per month.

Charleston, S. C.—The "International," the first coal boat of the Clinchfield Navigation Co., has been loaded with coal at Charleston. It is understood that this is the first of the fleet of vessels which will be operated by the Clinchfield Navigation Co., in handling export coal from this port.

Hartford, Conn.—The S. K. F. Ball Bearing Co. of Hartford, Conn, was recently organized with a capital stock of $2,000,000. The object of this organization is the manufacture and sale in this country of the ball bearings of this name, these heretofore having been all imported from Sweden.

Pittsburgh, Penn.—Record-breaking coal shipments to the Duquesne docks of the Monongahela River Consolidated Coal & Coke Co. were recently made from the company's mines along the Monongahela River. These shipments were for steel mills and are said to have been 2000 to 3000 tons per day in excess of former shipments. Five towboats were employed.

Huntington, W. Va.—If the first few days of the month are a criterion, all coal-loading records of the Chesapeake & Ohio R.R. will be exceeded in September. The total tonnage of coal handled during August was 2,423,000 tons, and it is believed that during September this will be increased to 2,450,000 tons. This would exceed all previous coal loading tonnages.

Charleroi, Penn.—The biggest monthly shipments of coal since October of 1913 are reported by the lockmaster at Lock No. 4 on the Monongahela River, in his report for the month of August. There were 446 lockages upstream, including 319 steamboats, 1,533 barges and flats. Downstream the traffic was 450 lockages, 318 steamboats, 1,564 barges and flats and 19,638,000 bu. of coal. In October, 1913, the total shipments of coal were 19,933,000 bu., which is but slightly above the August record of the present year.

Baltimore, Md.—The report on coal mining in Maryland during the fiscal year ending May 1 has just been made to Governor Goldsborough. The report shows a total of 3,888,611 tons mined during the period, a decrease of 551,033 tons from the tonnage of the same period of the year previous. A total number of 5,480 persons were employed in coal mining in the state, a decrease of 79. Decreased tonnage was blamed on the partial or complete shutdown of mining properties from time to time as a result of poor demand generally for fuel.

Bluefield, W. Va.—The total tonnage handled by the Norfolk & Western R.R. during the month of August was coal, 2,934,000 tons; coke, approximately 74,000 tons, which brings the total fuel shipments of the road to over 3,000,000 tons. The prospects are bright for the coal tonnage alone passing the 3,000,000 mark during the month of September. The recent installation of the electric system has aided materially in handling this immense tonnage, a large portion of which has been eastbound, the foreign trade being exceptionally heavy.

Connellsville, Penn.—The Connellsville coke region is now operating at approximately 75 per cent. of its rated capacity, and production has risen to over 390,000 tons per week. The wages being paid are the highest in the history of coking. It has been estimated that within the past few weeks the Pittsburgh district has been forced to decline export steel orders amounting to 300,000 tons, the mills having orders sufficient to keep them running to capacity for the remainder of the current year. Domestic needs are also increasing, and it is estimated that purchases of railroad supplies during the remainder of 1915 will be 30 per cent. larger than for any corresponding period in the past two years.

Columbus, Ohio—Readjustment of bituminous coal freight rates which would give to Ohio coal producers an increased differential, it is stated has been agreed to by the railroads operating in Ohio, West Virginia, and Pennsylvania. Officials of these roads, at a recent conference, decided to file with the Interstate Commerce Commission the new schedule of freight rates on coal from West Virginia to all points in Ohio, Michigan, and Indiana, which, if approved, would fix a new differential in favor of Ohio coal operators at 40c. a ton, as against 25c., which has prevailed for some time. Ohio operators have long contended that under the existing rates they are unable to successfully compete with coal producers in West Virginia.

St. Louis, Mo.—The Lumaghi Coal Co. has received notice from the Illinois Public Utilities Commission that its complaint against the advance of 5½c. a ton in rates from the Illinois coal fields to East St. Louis, Madison and Granite City, Ill., had been overruled and that the advance would become effective Oct. 1. This will make the differential between shipments to this side and the east side of the river 20c., which was the figure for a number of years, but two years ago, when the Interstate Commerce Commission passed upon the application for increased rates, the advance to St. Louis became effective at once, making a rate from nearby mines of 57½c., while the rate of 32c. to east side towns obtained. The complaint against the advance within Illinois has made a differential of 25½c. during this period.

Coal Trade Reviews

General Review

Unseasonably hot weather causes a sharp relapse in anthracite. Bituminous still benefiting by the general expansion in manufacturing. Export business continues to expand. Pittsburgh district consuming at a record rate. Lake tonnage larger.

Anthracite—The unexpected and almost unprecedented spell of hot weather has caused a sharp relapse in the hard-coal trade, which has subsided into as dull a situation as prevailed during mid-summer. It is clear that dealers' bins are stocked up close to full capacity, and this coal will have to start moving out to the consumers before any activity can be expected. The stimulus resulting from the brief period of cool weather a week ago has entirely disappeared, and business that was refused at that time is now being eagerly sought. However, it is evident that stocks in the consumers' hands are considerably below normal, shipments for the year to date being close to 2,000,000 tons less than the corresponding period last year, and any ordinary cold weather should start the coal moving rapidly.

Bituminous—The various constructive factors in the market still prevail and prices are fairly firm both for spot and forward delivery. Occasional market cargoes are difficult to move but as a rule the shippers are very conservative over future commitments, and there is increasing evidence that the export trade will prove a potent factor in the local market. The slow expansion in general industrial conditions is undoubtedly carrying the coal trade with it on to better things. The possibility of a car and labor shortage continue to be threatening features in the situation. Spot business is generally at a standstill but the movement on contracts is fair.

Exports—The export business continues fully up to the high average maintained last month, and there seems to be a tendency to advance prices in this direction. The demand from Europe is constantly increasing and it is becoming evident that foreign countries are being forced to rely more and more on this country for their fuel supply. Some accumulation of coal is occasionally noted at Tidewater but a number of the heavier shippers in the off-shore trade are having difficulty in keeping sufficient coal on hand to take care of the vessel tonnage as it arrives. The number of vessels bunkering is notably less, but the deficiency is probably made up by most vessels taking sufficient coal for the round trip. The growing scarcity of vessel tonnage continues the chief depressing factor in the export situation.

Lake Market—With the steel mills in the Pittsburgh district outputting a greater tonnage than ever before in their history, the coal consumption in this line is undoubtedly at a record rate. Railroads are also increasing their demand, which is now practically normal, and there is a generally good movement in all directions with indications of a steady though slow improvement. Prices have stiffened, and there is a tendency toward higher levels on new contracts, but no important increase can be expected until some such emergency as a car or labor shortage develops. Canada continues in the grip of a war paralysis with business generally at a standstill and the situation further accentuated by the violent fluctuations in the rates of exchange.

The domestic trade in Ohio has suffered severely as a result of the recent hot weather, although it is generally agreed that stocks in the hands of the consumers are light, and the return of colder weather will precipitate a sharp rush for coal. In steam lines the outlook continues optimistic. There has been sufficient business negotiated in some sections to develop a car shortage, which was distinctly noticeable. Large steam consumers are also showing a disposition to cover their requirements against a further price advance, and the railroads are accumulating substantial reserve supplies to provide for emergencies. Considerably less consignment coal is noted on demurrage than for some time.

A year ago.—Anthracite is slowing down to a more normal basis, but an active winter is anticipated. Bituminous is showing indications of heaviness in all directions. Export business relieves the tension at some points. Domestic grades are steadying up while steam sizes are in excess supply and weak.

BUSINESS OPINIONS

Boston News Bureau—In this country we seem to be near the point where we are going to progress far or fall back. On the outcome of the foreign loan depends the amount of our sales to the allies, for these will probably be gaged largely by the size of the loan. Loans of the present magnitude cannot be arranged without considerable detail. There are many differences of opinion which have to be adjusted, and yet the financial master minds of the world are on the job ,and the result is bound to be satisfactory. Pending the negotiations now going on the country will mark time. Success of the loan will mean great prosperity in the new world. The whole industrial force of the country will be busy. People will be profitably employed.

Iron Age—With steel-making capacity so largely taken up for 1915 the trade is daily making calculations for the early months of 1916. There is more evidence that the hand of the railroads is being forced by the size of the foreign inquiry for steel to be shipped after Jan. 1. It looks now as though the railroads will all at once want a good many cars and locomotives and that they will have to take their turn after buyers who have been more forehanded. Locomotive orders and inquiries have been larger in the past week than in months. Some car requirements are shaping up. In the case of the New York Central both rails and cars are up, and rails for fall and winter delivery are expected to be placed at Buffalo.

American Wool and Cotton Reporter—Quiet but firm was the tone of the wool market for the week under review. American houses whose representatives bid at the London sales are waiting to see if permits will be issued for the exportation of wool from England to this country. The woolen goods market seems very satisfactory. Very good purchasing has taken place on some high-price lines. A favorable development in the men's wear market is the keen demand for the last week or so, for delivery of stock merchandise.

Bradstreet—Trade trends continue upward; confidence as to the future is spreading, and while holidays as well as conservatism in some quarters have not allowed full rein to trade movements, the week has provided another budget of favorable factors. Withal, conservatism is not absent, and this manifestation is seen at a number of centers where visiting buyers show a disposition to purchase frequently in relatively small lots.

Dun—All restraining influences have not been eliminated, but developments that count for most in the business world continue mainly on the constructive side. International political relations, though less threatening, still have a disquieting effect, the foreign exchange problems are as yet unsolved and dissension in the ranks of labor remains a drawback in some directions. With abundant harvests, however, a full measure of prosperity is possible, and never before was the promise of the grain crops more brilliant than at the present time.

The Southern Lumberman—The first days of September have shown no radical changes in the yellow pine market. Little price fluctuation of any kind has occurred and mills are generally adhering closely to price lists published about the first of the month. Railroad demand is again the feature of the market, though call from the retail yards, particularly in the West and South, has also increased. Greater confidence in the business of the immediate future marks the hardwood trade this week. Demand for hardwoods, while without particular features, is steadily expanding as consuming factories again come into the market preparatory to supplying their own holiday and winter trade.

Marshall Field & Co.—Wholesale distribution of dry goods is maintaining a steady volume although not as large as a year ago, at which time the anticipated scarcity of foreign merchandise was resulting in large demand for imported lines. Our retail sales are heavy, although the warm weather has been unseasonable for the sale of fall merchandise.

ATLANTIC SEABOARD

BOSTON

Pocahontas and New River continue favorable, but with no significant price movement. Panama R.R. bids the most notable recent feature. Inquiry light but export trade counted on for fall business. Georges Creek and Pennsylvania grades unchanged. Freights easy and anthracite in favorable position.

Bituminous—Little change can be reported this week in the situation of Pocahontas and New River. The Panama R.R. bids are not regarded as particularly significant in their bearing on the market. The low figures were made by shippers who are ordinarily dependent chiefly on the coastwise trade where this year the demand has been only moderate from the beginning of the season. There is a feeling, too, among the Hampton Roads shippers that some one or two of the agencies should make quotations low enough to save the tonnage for the Pocahontas and New River fields and not allow Pennsylvania shippers to get a foothold on such a comprehensive order.

Meanwhile prices f.o.b. Hampton Roads are fairly firm for both spot and deferred delivery. The various factors still take a hopeful view of fall and winter trade, although the off-shore market is expected to furnish the major part of the demand. Inquiry here is very light but that the market is generally firm is apparent in the very few concessions now made from the regular $2.85 price.

On-car quotations are practically unchanged. Stocks are at a maximum in most directions and very few consumers are interested in the market. An occasional "market cargo" goes extremely hard and prices continue at a low range.

On Georges Creek there are no new features. The shippers are very conservative on commitments coastwise and share the expectation of other interests that the export trade will be unusually attractive. The two 8,000-ton ships being built for the Consolidation Coal Co. for Mediterranean service are soon to be put in commission.

The Pennsylvania grades are running on contract business, very little spot trade being developed. No change in prices can be reported. That some of the larger operators are actively out for comprehensive tonnages was shown in the Panama R.R. bids when Cambria coal was offered at from $2.53@2.60 f.o.b. Philadelphia.

Water Freights still turn upon the spasmodic inquiry for coal, although 75 @ 80c. is the prevailing range on barges 2500 tons upwards. Freights from New York to Providence and Fall River are 45c., with an occasional offering at 40c.

Anthracite—There is now a fairly steady demand for what coal the companies are mining. Protracted fog along the coast has delayed the movement of barges to such extent that many New England dealers are pressing for shipments. The trade appears to be in favorable position and when cooler weather has set in there is bound to be an improved demand.

Bituminous prices at wholesale are quoted about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$0.90@1.40	$1.15@1.65	$1.67@1.77	
Philadelphia*	2.15@2.65	2.40@2.90	2.92@3.02	
New York*	2.45@2.95	2.70@3.20	3.22@3.32	
Baltimore*	....	....	2.85@2.95	
Hampton Roads*	....	....	....	$2.80@2.85
Boston†	....	....	....	3.58@3.78
Providence†	....	....	....	3.50@3.73

* F.o.b. †On cars.

NEW YORK

Anthracite dealers optimistic. Prices on individual coals stronger and dealers are apprehensive. Bituminous situation unchanged. Labor and cars short. Much interest in European situation. Demurrage coals scarce.

Anthracite—While there has been no apparent improvement in the anthracite Tidewater situation over last week, dealers are optimistic and only await the first real touch of cool weather. The warm weather of the past week caused a slump in demand and many cargoes have been held up. Prices for individual coals are a trifle stronger but still far from companies' circular.

Much interest is being taken in the demands to be made by the anthracite mine workers as a basis for the new working agreement.

Wholesale dealers report many unfilled orders on account of well-stocked bins. However, a few cool days would relieve the situation greatly. Householders are gradually returning to their city homes and retailers are showing greater activity. Collections continue slow. Some coal men say the past few months have been the worst they have experienced in many years in that respect. The shortness of money continues to be a potent factor in the slowness of the market.

More improvement has taken place in the line trade than at Tidewater, but the demand is far from normal. Demand from New England is good.

Nut coal is a drug on the market and individual coal is easily obtainable at from 25 to 35c. off companies' circular. Egg and stove have been generally quoted at from 10 to 20c. below regular circular, but still lower prices have been heard. Demand for pea coal is on the increase and shipments continue prompt. The buckwheat grades, especially rice and barley, are moving freer and shipments are better.

Current quotations are as follows:

	Lower Ports		Upper Ports	
	Circular	Individual	Circular	Individual
Broken	$5 05		$5.10	
Egg	5 30	$4 80@5.30	5 35	$4.90@5.35
Stove	5.30	4 80@5.30	5 35	4.90@5.35
Chestnut	5.55	5 00@5.55	5 60	5.10@5.60
Pea	3.50	3 25@3 50	3.55	3.50@3.55
Buckwheat	2.75	2 25@2 75	2.80	2.25@2.80
Rice	2.25	1.75@2 25	2.30	2.00@2.30
Barley	1.75	1.45@1.75	1.80	1.75@1.80

Bituminous—Shortage of labor and cars are the especial features of the soft-coal situation. Market conditions have improved slightly, so far as demand goes. There is not so much coal lying on the docks and some hurry-up orders have been received. However, there is plenty of coal for immediate shipment.

Interest in the demand from European countries is increasing. Exporters believe there is bound to be a shortage in the foreign markets and the American mines will be depended upon to make up the deficiency. New inquiries are being continually received and shipments are larger. Bunker requirements show improvement.

Soft-coal operators who are fortunate enough to have considerable of their output under contract are being kept busy. Large consumers are losing no time in taking their full requirements, and sometimes more. The railroads continue to store large quantities and some of the grades taken by them are practically out of the market. The car supply is tight owing to many of the smaller cars being used in the steel trade. Demurrage coal is scarce at Tidewater and there is not an oversupply of spot coals.

Current quotations are on the following basis:

	South Amboy	Port Reading	St. George	Mine Price
Georges Creek Big Vein	$3 20@3.30	$3 20@3 30	$3 20@3.30	$1.75@1.85
Georges Creek Tyson	2.90@3.00	2 90@3.00	2.90@3.00	1.35@1.40
Clearfield:				
Medium	2.65@2.80	2.55@2.65	....	1.10@1.25
Ordinary	2.55@2.60	2.55@2.60	....	1.00@1.15
Broad Top Mountain	....	....	....	1.10@1.45

PHILADELPHIA

Anthracite has relapsed back to the midsummer dullness, due to extreme heat. Prices again unsettled, especially on chestnut and pea. Individuals a growing factor. Bituminous shows gradual improvement. Good export tonnage, with tendency to higher prices.

Anthracite—The improvement noted last week has disappeared as suddenly as it came and the depression at this time is equal to the midsummer dullness. The conditions as to prices in the wholesale market are exactly the same as they were all summer. Business that was refused because of unsatisfactory prices last week is now being sought, and all the big companies report a woeful lack of orders, particularly for the local trade. The collieries were beginning to make good time, but there is not the least doubt that curtailment will take place at once.

Prices have been badly off circular, with the exception of stove, which is the popular size here and has held quite well. Egg coal, too, was fairly steady, but only because of the fact that the New England market continues to absorb a large proportion of this size. Chestnut is still the biggest problem, with no thought of anyone paying circular and with a price as low as April circular less tax on a good grade of coal. Pea also has lost the little strength it had last week, with offerings of any quantity of excellent coal at $1.85, and in several instances quotations as low as $1 65 have been noted.

The steam sizes are in plentiful supply, with buckwheat well taken care of. The other grades, however, especially rice, are very heavy, immense quantities going into the already large tonnage in storage. It is known that several of the larger companies are going to make special efforts this coming season to push the consumption of rice as a steam fuel in competition with bituminous. Collections are very slow, if anything more so than at any time during the summer.

The retail dealers are not asking the regular winter schedule for coal, as has been the usual custom at this time, but are offering deliveries at from 25c. to 50c. from the usual prices. The larger dealers, however, are asking the full winter prices and are extensively advertising their prices in the daily papers. The prices maintained by the larger companies, to which should be added the Pennsylvania state tax of 2½%, are as follows:

	Line	Tide		Line	Tide
Broken	$3.50	$4.75	Pea	$2.50	$3.25
Egg	3.75	5.00	Buckwheat	1.25	2.25
Stove	4.00	5.00	Rice	.85	1.75
Chestnut	4.15	5.25	Barley	.50	1.50

Bituminous—The improvement noted last week continues in most quarters. There is no spurt, but the betterment is gradual, indicating that it will be continuous along with the constantly improving industrial situation. As evidence of this the Pennsylvania R.R. reports that every car in good repair is now in service, and all the railroads are showing an increased bituminous tonnage. The car supply continues to be a factor, although not as yet serious. There have been no important price changes during the week, although large shipments to Lake ports still have a tendency to make all slack grades strong. The export business continues in good volume, with inquiries up to the average of last month, and there also seems to be a tendency to get a better price on new orders. Vessel tonnage is still unable to meet the demand, with the result that a number of clearances have recently been made of sailing vesels for trans-Atlantic ports.

The price situation is well represented by the following average quotations current this week:

Georges Creek Big Vein	$1.65@1.75	Fairmont gas, ¾	$1.20@1.30
South Fork Miller Vein	1.50@1.60	Fairmont gas, mine-run	1.05@1.15
Clearfield (ordinary)	1.00@1.20	Fairmont gas, slack	.70@ .80
Somerset (ordinary)	1.00@1.15	Fairmont lump, ordinary	.90@1.00
West Va. Freeport	.85@ .95	Fairmont mine-run	.85@ .90
		Fairmont slack	.60@ .70

BALTIMORE

Bituminous market steady with indications for a good fall and winter trade.

From all bituminous sources came encouraging reports. Production is now only about keeping up with demand, and surplus stocks have generally been eliminated. Everybody is now looking for a good fall and winter term. Prices have held firm during the week with little or no change from the previous week.

There was a meeting here of about 18 of the Fairmont district operators this week to discuss the proposed increase of rates from West Virginia, Ohio and Kentucky to the Northwest. The operators are preparing to fight the plan before the Interstate Commerce Commission.

Vessels are scarce for use in the export trade. A number of shippers are complaining that many cargoes are being delayed on this account.

HAMPTON ROADS

Shipments foreign continue heavy. Government takings fair. Prices Unchanged.

The movement from Hampton Roads ports for the week has shown up well. The export shipments have been principally to various Italian ports although some fair-sized cargoes have gone to South America. Practically all of the coal going foreign has been New River and Pocahontas mine-run, while that shipped coastwise has consisted of mine-run, nut and slack and high volatile although the movement of the latter has not been very heavy. Coastwise shipments have been to Boston, Providence, Fall River, Portland, Pawtuckett, Bangor, Everett and other New England ports with one cargo of 7500 tons for San Francisco.

There is no change in circular prices. There is some accumulation of coal in the local yards quite a number of the large shippers are short and have some difficulty getting coal forward fast enough to take care of vessel tonnage already contracted for. The number of steamers calling for bunker coal is still below the normal but the movement is holding up well as practically all of the steamers loading coal and grain cargoes are taking sufficient bunkers for the round trip. The quantities vary according to the size of the steamers, some vessels taking as low as 300 tons and under while others take 2000 tons and over.

Railroad Tonnages—Dumpings over the local piers for the past several weeks compare as follows:

	Week Ending				
Railroad	Aug. 14	Aug. 21	Aug. 28	Sept. 4	Sept. 11
Norfolk & Western	171,252	172,546	211,699	232,394	156,459

OCEAN FREIGHTS

The freight market is considerably firmer than a week ago owing to the absorption of vessels and continued demand from the grain trade. Cotton orders are also appearing in the market, and a few characters have been effected for cotton at high rates. But few steamers were closed for export coal during the past week and none of these characters were reported.

We would quote freight rates on coal by steamer as follows:

To	Rate	To	Rate
Havana	$2 50@2 75	Bermuda	**$3 00**
Cardenas or Sagua	2.75@3.00	Vera Cruz	3 50@3.75
Cienfuegos	3.00@3 50	Tampico	3 50@3 75
Port au Spain, Trinidad	**3.00**	Rio	8.04@8.16
St. Lucia	3.50@3.75	Santos*	8.16@8.40
St. Thomas	3.00@3.25	Montevideo	**8.04**
Barbados	**3.75**	Buenos Aires or La Plata†	**8.16**
Kingston	2 75@3 25	Rosario	**8.40**
Curacao	3.25	West Coast of Italy	**10.20**
Santiago	2 75@3.25	Barcelona**	**9.60**
Guantanamo	2 75@3.25	Valparaiso or Callao	7.00@7.50
Demerara	**5.00**	Marseilles	9.60@9.84

Note—Rates noted in **bold face** type are only approximate.

* Consignees paying dockage dues. ** Spanish dues for account. † Quotations on Plate coal by British steamers; neutral steamers are more difficult to obtain and the rates are always higher.

W. W. Battie & Co.'s Coal Trade Freight Report.

LAKE MARKETS

PITTSBURGH

Steel industry consumes record tonnage of coal. Lake shipments now satisfactory. Prices show further stiffening. Operations at 60 to 70% of capacity.

The steel mills of the Pittsburgh and surrounding districts are producing and finishing more steel than ever before in their history, and their coal consumption is undoubtedly at a record rate. One branch of the finished steel trade which is a large consumer of coal in proportion to the tonnage output, the sheet branch, is far from busy at present, the sheet mills only operating at from 60 to 75% of capacity, but other finishing lines are working up correspondingly more steel. Railroad demand has increased somewhat and is now practically normal. It has been reported lately that the Pennsylvania R.R. has put into service all its idle cars, and conditions on the Baltimore & Ohio and Pittsburgh & Lake Erie are somewhat similar.

Coal demand from retail dealers has not been good the past week or ten days, and not even up to normal for the season, as the weather has been exceptionally warm.

Lake shipments are now quite satisfactory and a normal movement to the close of the season is expected, with perhaps some pressure upon the transportation facilities. The season's total, however, will be small.

Coal prices have stiffened still further, and in particular there is more disposition to ask higher prices on contracts to Apr. 1. There is reason to expect the miners to demand a very considerable advance, for the biennial period beginning Apr. 1, such a demand as would result in a considerable suspension of mining and a sharp demand for coal preceding Apr. 1.

Mine operations in the Pittsburgh district are between 60 and 70% of capacity, on an average, with occasional reports of car shortages.

Prices for free coal are firmly held at the following minimum quotations: Slack, 50@60c.; nut and slack, 90@95c.; nut, 95c.@$1; mine-run, $1@1.05; ¾-in., $1.10@1.15; 1¼-in., $1.20@1.25, per net ton at mine, Pittsburgh district. On contract to Apr. 1 the market is firm at 85@95c. for slack, $1.15@1.20 for mine-run, $1.25@1.30 for ¾-in. and $1.35@1.40 for 1¼-in.

BUFFALO

Bituminous moving a little faster. Prices fairly strong. Prospect of a good fall and winter trade. Anthracite not stirring much yet.

Bituminous—The trade is much encouraged. All sizes, including slack, are strong and the prospect is for a steady though rather slow improvement till the average movement is reached. The main difficulty is that there is sure to be an output that will keep pace with the demand, and this will hold prices down to about the present level till some emergency appears. The expected emergency is a shortage of cars. There are already reports of a scarcity and some sections of the Pennsylvania bituminous mines are already on an allotment basis. The railroads have taken the alarm and both the bituminous and the anthracite roads are stocking considerable coal.

Reports from Canada are not reassuring. Business remains dull and the factories especially are not active. There is a sort of war paralysis over the entire land that bids fair to continue till the war is ended, or there is a decided turn for the better. It was a mistake to put up the tariff on coal there, as it has only tended to cut down business. The peculiar condition of the money market there has also made collections difficult. Not a few business men who were not doing well closed up their affairs and went into the army, sometimes leaving their debts unpaid.

The prices of bituminous grow stronger week by week. Slack is doing especially well, considering the time of the year. Quotations remain on a basis of $2.65 for best Pittsburgh lump, $2.50 for three-quarter, $2.40 for mine-run and $2.05 for slack. The price of Allegheny Valley coal is about 25c. lower than Pittsburgh.

Anthracite—The fall trade has not yet set in and the slow movement by Lake shows that the reported increased activity at Upper-Lake ports cannot be heavy. The companies appear anxious to get more coal distributed before the late fall rush and they are laying down a surplus wherever they find a convenient stocking ground. The Lake shipping agents are doing what they can to fill in any gaps on the Upper-Lake docks and will continue to do so till the Lake season closes. A report from Oswego states that after a period of light shipments the port has resumed a normal movement.

The amount of anthracite shipped from Buffalo by Lake is not heavy, being for the week only 85,000 tons. It is not common to fall below 100,000 tons during the full season. The anthracite prices have now resumed the winter maximum as follows, f.o.b. cars at Buffalo: $5.60 for grate, $5.85 for egg and stove, $6.10 for chestnut and $4.30 for pea, with 25c. extra for delivering on board Lake vessels.

TORONTO, CAN.

The usual fall advance in the price of anthracite was announced on the first of the month. Business was brisk for a week or so before the rise, but has slackened considerably since, and is likely to remain quiet until cooler weather sets in. The yards are well stocked and consignments are coming in freely. Quotations for best grades are as follows: Retail, anthracite, egg, stove and nut, $7.75; grate, $7.50; pea, $6.50; bituminous, retail, steam, $5.25; screenings, $4.25 to $4.50; domestic lump, $6; cannel, $8. Wholesale, f.o.b. cars, three-quarter lump, $3.56; screenings, $3.

COLUMBUS

Warmer weather has an adverse effect on the domestic trade. Steam business is still rather active and prices well maintained. Rural dealers buying more freely.

The warmer weather of the past week has had a rather bad effect on the domestic business. Dealers who were laying in stocks have stopped their shipments for the time being and there is a slight lull. This is believed to be temporary only, as retailers' stocks are light and dealers must lay in supplies for the winter's business.

Steam business is continuing rather active and reports show that manufacturing is still increasing. Large war orders have been placed and coal is needed for power purposes. Railroads are still stocking up large quantities to guard against strikes or other untoward circumstances. Contracting is more active and quite a few contracts are expiring at this time. There is scarcely any demurrage coal on the local market.

Prices throughout the list are holding firmly, especially on the domestic sizes. Anthracite is also moving well. Considerable Hocking lump is being stocked for the winter. Retail business is a little slow because of the warmer weather, but contracting for school supplies is going on rapidly. Rural dealers are now buying better as farmers have completed their harvesting and have time to haul their fuel supply.

The Lake trade is rather active as shippers want to rush as large a tonnage as possible to the head of the Lakes before the close of navigation. Lake prices are unchanged. Reports from the Northwest indicate that the interior movement is larger. The Toledo docks of the Hocking Valley Ry. have been busy during the week loading Lake steamers.

Prices in Ohio fields are as follows:

	Hocking	Pomeroy	Eastern Ohio	Kanawha
Re-screened lump	$1.50	$1.50		
Inch and a quarter	1.40	1.40	$1.30	$1.30
Three-quarter inch	1.25	1.25		1.25
Nut	1.15	1.25		1.15
Mine-run	1.05	1.10	1.00	1.05
Nut, pea and slack	.65	.70	.55	.65
Coarse slack	.55	.60	.45	.55

Mines have been working at about the following percentages of full capacity:

District	Week Ended Aug. 21	Aug. 28	Sept. 4	Sept. 11
Hocking	30	35	45	40
Jackson	20	20	20	25
Pomeroy	40	45	50	50
Crooksville	30	30	35	35

District	Week Ended Aug. 21	Aug. 28	Sept 4	Sept. 11
Cambridge	35	35	40	44
Massillon	30	50	40	40
Eastern O.	55	55	60	60
Average	33	34	41	42

CLEVELAND

Prices on fine coal are stiffening. Car shortage being felt. Lake coal prices firmer and higher.

Excepting Fairmount lump and mine-run the local market is supplied with all other coals quoted. There is not a great deal of coal on track and slack is from 5 to 10c. a ton higher than a week ago. How much of this is due to the idleness of the mines early last week cannot be determined until the shipments are back to normal. All of the Ohio and Pennsylvania mines lost from one day to a day and a half through car shortage last week and will lose as much this week.

There is a stronger tone to the Lake coal market. Youghiogheny coal, which has been sold at $1.95 with $2 high at the docks, is now held by many shippers at $2 to $2.05. Shippers in Ohio are also holding their coal at higher prices in about the same proportion. August weather prevailed the first of the week and the high temperature held up the domestic trade. Deliveries are being made on orders placed some days ago, but the trade continues to act slowly in laying in the winter supply.

The Lake business is showing material improvement and cargoes are coming forward somewhat better. The grain that has been threshed is slow in arriving at the upper ports and receipts have been practically half as lareg as a year ago. This has tended to hold back the coal shipments from upper Lake docks. Large receipts of grain are expected next week at Duluth-Superior and coal shipments will incerase rapidly thenceforth.

Quotations to jobbers are as follows:

	Pocahontas	Youghiogheny	Fairmount	Bergholz	Ohio No. 8
Lump	$3.70			$2.30	
Lump, 6-in.				2.30	
Lump, 1¼-in.		$2.25		2.10	$2.15
Lump, ¾-in.		2.15@2.20	$2.00	2.00	1.95@2.00
Egg	3.70			1.95	
Mine run	2.70	2.10@2.15	1.90	1.85	1.85
Slack		1.65	1.65	1.55	1.60

DETROIT

Broader market develops for steam coal. Prices continue to firm up. Domestic coal more active in retail trade. Anthracite distribution well under way. Lake transportation still curtailed.

Bituminous—Increasing optimism is noted among Detroit coal shippers, with a continuance of the favorable conditions affecting the steam-coal market, and numerous orders are being booked. Although almost all these orders cover small consignments, the repetition of these suggests a more satisfactory condition. Another encouraging feature is a greater activity of manufacturing establishments and a broader demand for steam coal. There has also been a reduction in the amount of consignment coal here. There is still much of this stock available, but the better condition of the market pervents any large tonnages from being offered at sacrifice prices.

West Virginia gas and splint three-quarter lump hold well at $1.10, while nut, pea and slack range from 55 to 65c. for lower grades to 75 and 90c. for more desirable qualities. Smokeless lump and egg are quoted at $2.25, nut at $1.75 and mine-run at $1.25, all quite firm. Hocking domestic lump is now bringing $1.35, three-quarter lump $1.25 and upward, with mine-run at 70 to 80c. These are all mine prices, lower figures being still occasionally available on sale to avoid demurrage.

Anthracite—Orders to shippers are not in large volume, the present season, following the termination of discounts, developing only limited business until stocks of retail yards have been reduced. The distribution to consumers is in progress and with the prospect of the customary winter advance of 50c. a ton the first of next month, buyers are beginning to awaken to the necessity of action. A slightly better movement from the Upper Lake docks is reflected in a freer movement of coal over the Lake route. Shipments are still far short of normal volume at this season, and even many freighters having season contracts are forced to make the upbound trip without cargoes.

CINCINNATI

Price concessions and a slow demand are keeping the domestic market dull. Some improvement in the steam trade.

Reports agree that most of the retail trade is either well stocked with bargain coal or is now receiving deliveries of fuel purchased at low prices during the spring and summer. Price concessions are still noted but have had the opposite effect from that of stimulating business. Buyers are now firmly convinced that they can get their supplies at abnormally low prices at any time.

The steam market is also very dull, but the coke market is active. Wholesale handlers of coal are far from optimistic just now, however, the general feeling being that only cold weather can help much.

LOUISVILLE

Market holds the recent improvement and consumers are beginning to cover their requirements. Car shortage already felt.

The market continues to hold firm and the optimistic feeling is still in evidence. Inquiries are numerous and the mines are selling enough coal for immediate delivery to bring about a car shortage, which was distinctly felt on the Louisville & Nashville lines for several days. One of the best indications of the improvement is the disposition of large steam coal users to contract. They have been taking advantage of the low prices, but now they are getting under cover, realizing that the market is definitely stronger and that prices are on the up-grade. Quotations are practically unchanged on eastern Kentucky coal, block bringing $1.50 to $1.75, with fancy grades at from $1.90 to $2. Slack is worth 60c. for immediate delivery, but contract business is being booked regularly around 70c.

COKE

CONNELLSVILLE

Reports of furnace coke contracts for first half 1916. Sliding scale contracts preferred. Prompt furnace coke still weak while foundry coke is stronger. Production and shipments slightly decreased.

Unconfirmed reports are that two or three furnace-coke contracts have been made, for deliveries over the first half of 1916, on the basis of $1.75 for coke when basic pig iron is $13.75, valley, or less, with 5c. advance in coke for every 25c. advance in pig iron, prices to be adjusted monthly. While it is not positively known that such contracts have been closed it is known that some operators would be willing to sell on this basis. There are rumors that one or two furnace interests have closed on an even higher basis, for the reason that the furnaces are not in blast and it is not known certainly that they will take full deliveries.

There is considerable negotiation for furnace coke for the first half of the new year, and both buyers and sellers seem to prefer a sliding-scale basis, but the negotiations are protracted as there is much discussion of ratios. Some of the furnaces seem willing to concede a great deal to the sellers, in the event of high pig-iron prices, provided they are given corresponding concessions when pig iron is relatively low.

Furnace coke for prompt shipment continues in light demand, and while there is not much unsold coke on track there seems to be enough to prevent the spot market from reflecting the prices the operators demand for forward shipment.

Demand for foundry coke continues fair, with prices slightly higher. We quote: Prompt furnace, $1.60@1.65; furnace, September, $1.75; furnace, to Jan. 1, $2; prompt foundry, $2.30@2.60; contract foundry, $2.40@2.60, per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Sept. 4 at 379,935 tons, a decrease of 2,671 tons, and shipments at 380,631 tons, a decrease of 7,476 tons.

Buffalo—There are shippers who claim to be getting better prices for foundry coke than the regular quotations, but as a rule the trade finds $4.30 for best 72-hr. Connellsville foundry quite high enough, with stock coke $3.35. The former strength and activity continue and the movement of both ore and pig iron in this market appears to warrant prices on this basis. Lake receipts of ore at Buffalo for the week were 217,000 gross tons, a much larger amount than formerly.

MIDDLE WESTERN

DULUTH

Cooler weather would have a tendency to stimulate the market. Slow grain movement delaying the coal trade.

Bituminous—Dock companies have been doing only a fair volume of business during the past week, nor is any great increase in shipments looked for until cooler weather prevails. Another factor tending to retard shipments is that the grain-handling season is about two weeks later than usual, so that the customary "fall rush" of orders from the grain elevator lines engaged in the retailing of coal are not expected to appear until the middle or latter part of September.

Some wavering in prices for domestic grades to the country dealers has been noted, but on the whole the circular list has been fairly well maintained. Circular price lists issued by the dock companies, effective Sept. 1, are as follows:

	Youghiogheny	Hocking	Splint	Smokeless
Lump	$3.40	$3.40	$3.40	$4.75
Dock run	3.10	3.05	3.10	3.25
Screenings	2.40	2.25	2.40	2.75

Anthracite—There was the usual monthly advance of 10c. per ton on Sept. 1, this being the last advance of this kind for the year. The movement of anthracite to the country is about normal, although a little cooler weather would be some incentive for the dealers to stock up. Egg and stove sizes are quoted at $6.85, nut $7.10 and pea $5.55, f.o.b. cars at the docks.

ST. LOUIS

Situation good with prices steady but orders less plentiful. Screening inclined to be heavy. High-grade coals moving freely.

Trade conditions are good. Prices are keeping up on domestic sizes and screenings are in fair demand but slightly weaker. The buying, however, has not been as brisk on account of a few days of warm weather, which is also felt by the dealers, who report they have plenty of orders but they are not coming in as fast now as a few days ago.

The car situation is some better and orders for Williamson and Franklin County coal are now being filled that were taken in the latter part of August.

The demand for high-grade soft coal is sharp, showing much improvement over the past few weeks. The supply is normal and the dealers are making excellent deliveries. With the increased demand has come an advance in price and the market is considered firm at the new figures. While the higher grades are showing improvement, it is noted that the "inner group" is suffering from a lack of demand. These mines produce the greater part of the low-grade coal used in this city and the lack of work among the wage earners has prevented them from paying for their last year's coal. As a result a great amount of the cheap coal business will be done this winter in small lots, for cash and as needed. The present circumstances of the wage earners, however, are much improved and the coal dealers are not looking for a distress season.

The market is quotable as follows:

	Staunton	Collinsville	Sparta	Standard
6-in. lump	$1.35@1.50	$1.20@1.35	$1.15@1.25	$1.15@1.20
3 x 6 egg	1.15@1.30	1.10@1.25	1.00@1.10	.90@1.00
2-in. lump		1.15@1.20	1.05@1.10	.95@1.00
No. 1 nut	....	....	....	.75@ .85
No. 2 nut	....	....	....	.60@ .70
No. 1 washed	1.50	1.30@1.35	......	....
No. 2 washed	1.25@1.35	1.25	....	....
No. 3 washed	1.20	1.15	....	....
No. 4 washed	1.15	1.10	....	....
No. 5 washed	.70	.65@ .70	....	....
Screenings	....	....	.50	.45@ .50

The rate from inner group mines is 57½c. per ton to St. Louis and 25½c. per ton less to East St. Louis. For beyond St. Louis the rate to East St. Louis is 25c. per ton.

KANSAS CITY

The retail trade in Kansas City has been increasing and prices are from 25 to 75c. over those of a few months ago. The dealers have commenced to open their yards for the winter trade and much coal has arrived from the mines. The wholesale market has been a little better than for some time. Prices on semianthracite are still 25c. in advance of a month ago.

PORTLAND, ORE.

No Pennsylvania anthracite will be shipped here the coming season, it is said, because of the prohibitive water transportation rates and scarcity of vessels. Last winter it was hoped that coal could be laid down here from Pennsylvania at a figure that would permit its sale at $12 per ton, but this is quite out of the question now. Some anthracite is being brought in from Alberta, and it is said to meet with fair satisfaction. The coal sells here for $12.25 per ton, chestnut size, and $13.75 egg size.

It is said some Wellington coal may be brought here the coming fall from Vancouver Island mines, and the freight would permit it selling possibly at 50c. less per ton than the Utah coal.

PRODUCTION AND TRANSPORTATION STATISTICS

ANTHRACITE SHIPMENTS

Anthracite shipments for August and the first eight months of 1914-15 were as follows:

	August		8 Months	
	1915	1914	1915	1914
Phila. & Reading	847,262	904,643	7,100,087	7,768,256
Lehigh Valley	1,029,721	1,079,172	8,354,180	8,260,472
Cent. R.R. of N.J	613,721	637,467	5,010,562	5,735,445
Del. Lack. & West	859,368	819,848	5,970,751	6,245,125
Del. & Hudson	731,137	619,062	5,232,732	4,706,619
Pennsylvania	426,818	497,579	3,766,322	4,121,427
Erie	690,817	734,350	5,097,909	5,441,578
Ont. & Western	131,987	191,622	1,327,797	1,542,467
	5,330,831	5,483,743	41,860,340	43,321,389

Stocks at Tidewater Aug. 31 were 653,496 tons.

THE CAR SUPPLY

The American Railway Association reports a surplus of 40,919 coal and gondola cars, and a shortage of 2,332 cars on Sept. 1. The gross shortage of all cars was 6,260, which compares with 948 on Aug. 1 and 1,913 on Sept. 1 of last year.

LAKE SHIPMENTS

The movement of coal through the Sault Ste. Marie Canal for August of the current year amounted to 2,050,960 short tons, of which 279,948 tons were anthracite, and 1,771,012 tons bituminous.

BITUMINOUS COAL MOVEMENT

The following is a summary of the movement of coal and coke over 13 principal railroads during June and the first six months of the last two years, in short tons:

	June		6 Months	
Anthracite	1914	1915	1914	1915
Baltimore & Ohio[1]	78,019	79,766	711,784	606,594

April	15,497,444	16,070,049
May	16,523,385	17,149,668
June	16,984,476	18,282,077
Total, 6 months	102,843,346	95,833,505

[1] Includes coal received from connecting lines.

[2] Includes company's coal.

[3] Does not include company's coal hauled free.

Note:—The Southern Railway hauled 234,712 short tons of bituminous coal during May, 1915, and 1,328,516 short tons during the five months ending May 31.

I. C. C. DECISIONS

I. C. C. No. 7983—In the matter of rates, divisions, rules, regulations and practices governing the transportation of railroad fuel and other coal.

1. The character of a shipment and not formal incidents, such as billing, determines the rate and divisions applicable. The rates and divisions to points of actual destination must be applied to railway fuel coal shipments here involved, and the application of rates and divisions to fictitious billed destinations is unlawful and can not be justified by the theory that such rates and divisions would be proper rates and divisions to the average point of actual destination.

2. A railroad company as shipper is entitled to the same consideration as any commercial shipper and no more, even when the shipment moves in part over the rails of such railroad company. It follows that in such case the carrier is entitled to a division of the joint through rate. But the division must be fixed by the same considerations which would determine divisions upon a through commercial shipment in which the railroad had no interest other than that of carrier. The divisions now received out of the joint rate on supply coal by the Seaboard Air Line, the Atlantic Coast Line, and the Charleston & Western Carolina Railway Co. for the hauls from their junctions are special and abnormal divisions.

3. The Commission may fix divisions when a railroad company is the shipper or is owned by the shipper so that the division of a through rate might be the means of indirectly reducing transportation charges or effecting discriminations. Divisions here involved will not be fixed by order at this time, but carriers will be expected to adjust them to meet views herein expressed.

4. The Commission may order that such divisions be filed with it and it is so ordered as to the divisions applicable to fuel coal shipments herein involved.

I. C. C. No. 4806—Plymouth Coal Co. vs. Lehigh Valley R.R. Co.

Reparation awarded on account of unreasonable rates charged for the transportation of anthracite coal from Luzerne, Penn., to Perth Amboy, N. J., for trans-shipment.

Financial Department

Pittsburgh Coal Co.

This company reports, in part, for the year ended Dec. 31, 1914, as follows:

Earnings—The gross earnings from all sources were $4,201,070 (a decrease of $2,220,632, or 34.58%); and the net surplus earnings, after all charges and usual depreciation, were $1,371,058 (a decrease of $1,355,210, or 49.71%), being in excess of 5% on the preferred stock outstanding.

Tonnage—The total tonnage produced and handled, including coke (but exclusive of coal purchased and handled direct by subsidiary companies) was 18,295,851 net tons (a decrease of 6,411,353 net tons, or 25.95%).

Productive capacity used was about 54%. The number and use of mining plants in all fields were: working all or part of year, 71; abandoned, 7; available but idle, 6; leased, 7; total, 91. Unsettled mining conditions and substitution of West Virginia coal were the main causes of practically five months' idleness in the Ohio mines.

There was an average increase in cost of 0.49c. and a decrease in sales value of 2.51c. per ton. The Monongahela River Consol. Coal & Coke Co. had no opportunity the greater portion of the year to move its product to take care of its down-river trade. The iron and steel industry, which takes a material portion of its output, was much depressed most of the year.

Trade Conditions—Trade conditions were adverse all the year and became unprecedented during the last half-year because of foreign hostilities. Owing to excessive competition, upsetting both costs and sales values, it was difficult to secure favorable results. A large tonnage loss was made in Lake cargo and fuel business, to the advantage of the West Virginia fields, which show an increase for the year. Our representatives were sent to South America, but found no shipping facilities to compete with the present sources of supply.

Acquisition—The property and mines formerly owned by the Illinois Collieries Co. were acquired under mortgage foreclosure and are now operated under the name of the Montour Coal Co. of Illinois.

Montour R.R.—This railroad has been completed and is now in operation, its substantial construction insuring a minimum of maintenance expense. The cost of construction was increased above the amount estimated only by the practical elimination of all grade crossings, and for right of way. The three new mines which, under existing contracts, we were obligated to open during the year, are now in service and ready to develop trade.

Railroad Lake Freight Rate.—The effort of the carriers to increase coal rates and especially the Lake cargo rate from the Pittsburgh District, was not successful, and they remain the same as before the tariffs of October, 1913 were filed, without elimination of any of the existing discrimination.

Sale of Property to M. R. C. C. & C. Co.—Since Dec. 31, 1914, a sale of 10,859 acres of coal rights, including 375 acres of surface owned and improvements thereon, has been made to The Monongahela River Consol. Coal & Coke Co. (the stock of which is practically owned by this company) at an average of $812 per acre for the coal and aggregating $8,822,717.

The funds for this payment were chiefly derived from the sale of property made by that company in 1911 and interest increment since that time, which has been held by The Union Trust Co. of Pittsburgh, as trustee under that company's mortgage of 1899, applicable under its terms for the purchase of additional property or for the retirement of bonds issued under it, $6,323,000 now outstanding. This transfer will increase the coal acreage of the Monongahela Co. to approximately 26,000 acres, upon which the bonded debt, taking into account the bond sinking fund credit, will be less than $230 per acre.

Retirement of Bonds—With the proceeds of this sale it is proposed to retire the $8,011,000 bonds of the Pittsburgh Coal Co. of Pennsylvania by call for payment on July 1, 1915.

After payment of these bonds our total funded debt, including the obligations of all the subsidiary companies, will be $141.62 per acre, based on a total ownership of 148,283 acres of unmined Pittsburgh vein coal, exclusive of improvements, with all other assets free.

Benefit of This Bond Payment—This transaction will effect an annual saving of about $400,000 in bond interest, and also stop the drain on working capital of about $700,000 annually for bond principal retirement. Also through the release of the stock of the Pittsburgh Coal Co. of Pennsylvania, now pledged under the mortgage, an earlier adjustment of the dividend arrearage upon the Pittsburgh Coal Co. of N. J. preferred stock outstanding will be made possible. Furthermore, by giving up the charter of the latter company, there will be a further material saving.

Outlook for 1915—Until the depressing influences are lessened through settlement of foreign troubles and domestic affairs, no great or sustained improvement is to be expected in the trade conditions in this district, but the expected release from large interest and other overhead charges gives a reasonable assurance that our company will be able to maintain itself with results to its shareholders.

Note—For previous annual report of this company see Vol. 6, p. 92.

⁂

Elk Horn Fuel Co.

This company reports for the year ended Dec. 31, 1914 as follows:

INCOME ACCOUNT FOR YEAR ENDING DEC. 31, 1914

DIVIDENDS

The following is a list of the more important dividends recently announced:

Consolidation Coal Co.—Regular quarterly dividend of 1½%, payable July 31 to holders of record July 24.

Delaware, Lackawanna & Western Coal.—Regular quarterly dividend of 2½% and an extra dividend of 50%, both payable July 15 to holders of record July 1.

American Coal—Dividend of 3%, payable Sept. 1 to holders of record Aug. 31.

John M. Taylor Coal Co.—Semiannual dividend of 3½% on the preferred stock, payable Aug. 20.

Elk Horn Fuel Co.—Dividend of 1¼% on the preferred, payable Aug. 2 to holders of record May 1.

Jefferson & Clearfield Coal and Iron Co.—Dividend of 1¼% on the preferred, payable Aug. 16 to holders of record Aug. 9.

Pacific Coast Co.—Regular quarterly dividend of 1¼% on the first preferred and 1% on the second preferred, both payable Aug. 2 to holders of record July 25 to Aug. 2.

Coal Contracts Pending

The purpose of this department is to diffuse accurate information of prospective purchases and prices with a view to affording equal opportunity to all, promoting market stability and inculcating sound business principles in the coal trade.

For the official advertisements of bids wanted see the Contracts-to-Be-Let Section on Page 16.

+Indicates contracts regarding which official information has been received.

Supplemental Notes

Under this heading additional or supplemental information regarding old contracts appears, together with the page number of the original notice.

1047—Kansas City, Mo.—William Volker & Co. still continue to buy their coal requirements on this contract (p. 116), in the open market. Address Purchasing Agent, William Volker & Co., Main and Second St., Kansas City, Mo.

1056—Kansas City, Mo.—The Gillpatrick Laundry Co. has decided to continue buying their coal requirements on this contract (p. 116), in the open market for the time being, but are willing to consider propositions to contract at any time. Address Purchasing Agent, The Gillpatrick Laundry Co., Vine and 15th St., Kansas City, Mo.

1062—Kansas City, Mo.—The Faultless Starch Co. will still continue to make their fuel purchases in the open market (p. 116), but they are willing to consider a proposition to cover their requirements at any time. Address Pres. J. G. Beecham, Faultless Starch Co., 1025 E. Eighth St., Kansas City, Mo.

+1192—New Brunswick, N. J.—Bids have been received on this contract (p. 244), which provides for furnishing the City Pumping Station with approximately 900 tons of coal as follows: Daniel June No. 1 Logan $4; New Brunswick Ice Co., Beaverdal $4.30; C. W. Russell No. 1 Logan $4.39. No notice of the award has yet been received. Address City Clerk E. J. McLaughlin, Dept. of Pub. Affairs, New Brunswick, N. J.

+1198—Columbus, Ohio—The Ohio Board of Administration advises that they are now only receiving bids on the Cleveland State Hospital, Columbus State Hospital, Dayton State Hospital, and Ohio Penitentiary on this contract (p. 244). Address T. E. Davey, Ohio Bd. of Administration, Columbus, Ohio.

+1252—Minot, N. D.—The second call for bids on this contract (pp. 284, 410) was received until 2 p.m., Sept. 17. The contract provides for furnishing school buildings Nos. 1, 2, 3 and 4 of the Burlington School District with coal. Address Clk. W. E. Gross, Burlington Schoool Dist. No. 7, Minot, N. D.

1260—Louisville, Ky.—The Watterson Hotel, which usually consumes 2500 tons of nut and slack coal per year advise that they are concluding arrangements to buy steam and will not make any contract this season. Address Mgr. Robert B. Jones, Watterson Hotel, Louisville, Ky.

1262—Des Moines, Iowa—The tonnage involved on this contract (p. 324), which provides for furnishing coal to some 60 schoolhouses of the Independent School District aggregates about 8000. Steam coal will be required mostly although some lump and range will also be bought. The contract is to include cost of delivery in the bins at the schoolhouses. Address Secy. A. L. Clinite, Bd. of Edu., Des Moines, Iowa.

1267—Wellsburg, W. Va.—This contract (p. 324), which provides for furnishing the local City Water-Works with coal during the ensuing year was bid on as follows: Wolf Estele & Ondo $5\frac{9}{10}$c. per bu.; Elias K. Lazear 6c. per bu.; Washington Pike Coal Co., 6¼c. per bu. Address Secy. J. F. Thompson, City Water Bd., Wellsburg, W. Va.

+1285—Bay City, Mo.—New bids have been received on this contract (p. 324), which provides for furnishing the County Government with coal for the Court House during the ensuing year as follows: City Fuel & Supply Co., $3.40; A. S. Williams & Co., $3. Steam lump coal is required. Address County Clk. C. L. Fox, Bay City, Mo.

New Business

+1417—Reading, Mass—The Municipal Light Department at this place usually contracts for their annual requirements of coal some time during the fall months. The current contract was filled on the basis of $4.20 per ton for Pocahontas or New River coal, the gross requirements being approximately 400 tons. Address Mgr. A. G. Sias, Municipal Light Dept., 179 Main St., Reading, Mass.

+1418—Huron, S. D.—The Board of Commissioners at this place received bids until 1 p.m., Sept. 13, for furnishing approximately 400 tons of Youghiogheny lump coal, to be delivered at the city pumping plant as required at the rate of about 40 tons per month. Bids were also received on 12 tons of anthracite and 18 tons of Pocahontas lump coal to be delivered at the City Hall, Jail and Library. Address City Audr. S. S. Oviatt, Huron, S. D.

1419—Bellaire, Ohio—The Mead Township Board of Education received bids until Sept. 10, for furnishing approximately 1,900 bu. of three-quarter coal to be delivered to the various subdistricts as required prior to Oct. 1. Address Clk. Thomas C. Kirkland, Mead Township, Bd. of Edu., Belmont County, Bellaire, Ohio.

1420—New Haven, Conn.—The Connecticut Co.'s contract, involving approximately 22,000 tons of good grade low volatile, low ash, low sulphur bituminous coal, expired on the first of the current month. Shipments are made as required f.o.b. boats, to be placed by the company at New York loading ports. For data in regard to the old contract see Vol. 6, p. 735. Address Pur. Agt. J. H. Sanford, The Connecticut Co., New Haven, Conn.

+1421—Dowagiac, Mich.—The Water and Light Dept. at this place usually contracts some time during October for their annual requirements of coal involving approximately 1,000 tons. Island Creek nut, pea and slack coal is commonly used and the usual price is about $3.10 per ton. Address Supt. W. E. Reynolds, Water and Light Dept., Dowagiac, Mich.

1422—Westwego, La.—The New Orleans Industrial Oil Co., are receiving bids on approximately 100 tons of steam coal for use during the ensuing year. Address Mgr. J. P. Eggert, New Orleans Industrial Oil Co., Westwego, La.

+1423—Topeka, Kan.—The Municipal Electric Department usually contracts in October for their annual requirements of coal involving approximately 400 tons. Southern Kansas coal is used and it is ordinarily bought at $2.25 per ton for slack and $2.50 for stove. The business is done on competitive bids. Address Supt. E. G. Stahl, Municipal Electric Light Dept., Topeka, Kan.

1424—Warren, Ohio—The Trumbull County Board of Commissioners will receive bids until Sept. 20, for furnishing about 500 tons of coal for the County Infirmary. Address Audr. W. R. Harrington, Trumbull County, Warren, Ohio.

1425—New Orleans, La.—The Albert Weiblen Marble & Granite Co. will soon contract for their annual requirement of coal involving approximately 2,000 tons. Address Pur. Agt. Albert Weiblen Marble & Granite Co., City Park Ave. and St. Louis St., New Orleans, La.

+1426—Rugby, N. D.—The Pierce County Commissioners will receive bids until 2 p.m., Oct. 5, for furnishing coal as may be required during the ensuing year. Address Audr. A. O. Spillum, Pierce County, Rugby, N. D.

1427—Zylonite, Mass.—The contract for the Berkshire St. Ry. Co., involving approximately 21,000 tons of a good grade, low volatile, low ash, low sulphur, bituminous coal expired on the first of the current month. Shipments are to be as required, and quotations should be made f.o.b. cars at mines for Tunnel Power plant at Zylonite, Mass., B. & A. R.R. Address Pur. Agt. J. H. Sanford, Berkshire Street Ry., New Haven, Conn.

+1428—Unionville, Mo.—The Municipal Light and Water Works at this place usually contract some time in October or November for their annual requirements of coal, involving about 200 tons of nut and pea per month. The business is done on a competitive basis and the approximate cost is about $1.10 per ton. Address Supt. M. T. Lynn, Unionville, Mo.

1429—Massillon, Ohio—The Board of Education of the city school district will receive bids until Sept. 29 for furnishing the various public schools with Goshen or Massillon mine-run lump and slack coal. Address Clk. William Fielberth, Bd. of Edu., Massillon, Ohio.

1430—Fargo, N. D.—Bids were received until Sept. 15 for furnishing approximately 1,500 tons of Youghiogheny screenings and 500 tons of Pocahontas mine-run, to be delivered at the Detention Hospital and Filtration Plant as required during the ensuing year. Address Audr. A. R. Watkins, Bd. of Com., Fargo, N. D.

1431—Braddock, Penn.—Bids were received until 7 p.m., Sept. 13, for furnishing the Rankin School Board with three-quarter and mine-run coal. Address Secy. H. W. Peters, Rankin School Bd., Rankin, Penn.

1432—Hammond, Ind.—The Northern Indiana Gas & Electric Co. usually contract for their annual requirements of coal some time during October. One and one-quarter inch Indiana screenings are used and approximately 35,000 tons are required. The coal is bought on competitive bids, the usual price being about $1.38 per ton delivered. Address Purchasing Agent, Northern Indiana Gas & Electric Co., Hammond, Ind.

+1433—Peoria, Ill.—The City Government received bids until 5 p.m., Sept. 14, for furnishing the city with bituminous lump coal for one year beginning Oct. 1. The coal must be from Peoria County and 1¼-in. lump size. A certified check for $200 must be furnished with each bid. Address Clk. William E. Moran, Peoria, Ill.

+1434—Poplar, Mont.—Bids will be received by the Poplar Public Schools, District No. 9, until noon, Sept. 24, for furnishing approximately 75 tons of Hocking Valley coal to be delivered in the school bins as required during the ensuing year. Address Clk. H. C. Walker, School Dist. No. 9, Poplar, Mont.

1435—New Orleans, La.—The Canal Bank & Trust Co. will receive bids until Oct. 1, for furnishing coal required at their office buildings, involving approximately 150 tons of bituminous. Address Purchasing Agent, Canal Bank & Trust Co., Camp and Gravier Sts., New Orleans, La.

1436—Linton, N. D.—The Emmons County Board of Commissioners will receive bids until 4 p.m., Oct. 5, for furnishing and delivering 70 tons of lignite coal at the County Court House. Address Audr. John R. Snyder, Linton, N. D.

+1437—Osage City, Kan.—The City Government received sealed bids until 8 p.m., Sept. 15, for furnishing the coal required by the local Electric Light Plant, and for other city purposes during the period from Sept. 15, of the current year to Mar. 15 of next year. Osage City shaft coal is required. Address City Clk. C. E. Johnson, Osage City, Kan.

1438—New Orleans, La.—The Interstate Bank & Trust Co. will be in the market about Oct. 1 for their annual fuel requirements of their office building, involving about 200 tons of bituminous coal. Address Pur. Agt. Mr. Billingsley, Interstate Bank & Trust Co., New Orleans, La.

1439—Muscatine, Iowa—The County Government received bids until 5 p.m., Sept. 14, for furnishing approximately 200 tons of soft lump coal for use on the Muscatine-Louisa Drainage District No. 13. Address Audr. H. C. Schoemaker, Muscatine County, Muscatine, Iowa.

1440—Minot, N. D.—The Lexington Hotel at this place will receive bids until 2 p.m., Sept. 18, for furnishing approximately 300 tons of screened lignite coal, quotations to be f.o.b. Minot. Address Olof O. Olson, Lexington Hotel, Minot, N. D.

1441—New Orleans, La.—The New Orleans Cold Storage & Warehouse Co. will contract about Oct. 1 for their annual requirements of coal, involving approximately 3,500 tons of bituminous. Address Purchasing Agent, New Orleans Cold Storage & Warehouse Co., Gainnie and Front St., New Orleans, La.

1442—Crookston, Minn.—The Polk County Board of Commissioners will receive bids until 2 p.m., Sept. 21, for furnishing approximately 160 tons of Greensbury mine-run coal to be delivered at the Court House as required during the coming fall and winter. Address Audr. H. J. Welte, Polk County, Crookston, Minn.

1443—Minot, N. D.—The Dakota Bakery Co. will receive bids until 2 p.m., Sept. 30, for furnishing one carload of lignite coal per month. Address Purchasing Agent, The Dakota Bakery Co., Minot, N. D.

1444—New Orleans, La.—The American Brewing Co. of this place is in the market for their annual supply of coal, involving approximately 10 tons per day. Address Ed. G. Schleider, American Brewing Co., New Orleans, La.

1445—Chariton, Iowa—The County Government received bids until noon, Sept. 14, for furnishing coal required at the Court House, County Home, and for the paupers. The coal for the Court House will be delivered in the bin. Address Audr. Fred. N. Wilson, Chariton, Iowa.

+1446—Mauch Chunk, Penn.—The Borough School Board at this place will receive bids until 4 p.m., Sept. 24, for furnishing 60 tons of chestnut coal to be delivered at the Asa Packer Building, and 75 tons of pea coal to be delivered in the First Ward Building. Address Secy. C. S. Weiler, Borough School Bd., Mauch Chunk, Penn.

1447—New Orleans, La.—The Jacob Candy Co. will contract about Oct. 1 for their winter's supply of coal, involving approximately 400 tons of Pratt lump coal. Address Pres. Mose Jacobs, Jacobs Candy Co., Carondelet St., New Orleans, La.

+1448—Crosby, Minn.—The Independent School Dist. No. 51 will receive bids until 8 p.m., Sept. 18, for furnishing and delivering Youghiogheny screened lump coal, as may be required during the school year at Ironton, Thomas Jefferson and Franklin schools. Address Clk. J. E. McCoy, Independent School Dist. No. 51, Franklin School Bldg., Crosby, Minn.

+1449—Lisbon, N. D.—The Lisbon Special School Dist. No. 19 will receive bids until 1 p.m., Oct. 1, for furnishing approximately 125 tons of Hocking Valley, Zenith, Sunday Creek, Youghiogheny or Scott Smokeless Briquetts, to be delivered in the bins of the school buildings. Address Clk. W. S. Adams, Lisbon Special School Dist. No. 19, Lisbon, N. D.

+1450—Detroit, Mich.—The Wayne County's Board of Auditors will receive bids until 11 a.m., Sept. 18, for furnishing approximately 25 tons of anthracite chestnut, and 2,500 tons of bituminous three-quarter lump. Address Secy. William Gutman, Bd. of Audrs., Wayne County, Detroit, Mich.

Contracts Awarded

Note—Successful bidders are noted in **bold face** type.

+No. 960—Harriman, Tenn.—This contract (pp. 41, 411), which provides for furnishing the Harriman Water and Light Department with 2,160 tons of coal, has been awarded to the **Middle Creek Co.** instead of Church & Co. as previously noted. Bids on this contract were: Goldfield Coal Co., 95c.; State Mine Coal Co., $1.15; Middle Creek Co., $1. All bids were on mine-run coal. Address R. C. Walzl, Harriman Water & Light Dept., Harriman, Tenn.

No. 970—Gretna, La.—This contract (p. 41), which provides for furnishing the American Cotton Oil Co., has been awarded to the **Warrior Coal Co.** of Birmingham, Ala., at between $1.12 and $1.18 per ton. The contract, which involves 20,000 to 25,000 tons, will be filled on Pratt mine-run coal. Address Mgr. John W. Todd, American Cotton Oil Co., Gretna, La.

No. 1018—Kansas City, Mo.—This contract (p. 77), which provides for furnishing the Kelly Milling Co. with about 20 tons of slack coal per day, has been awarded to the **Sheridan Coal Co.** at $2.05 per ton. The Cherokee Fuel Co., Central Coal & Coke Co., and Interstate Coal Co. each bid $2.05 per ton also, it being understood that the contract was awarded to the **Sheridan Coal Co.** on account of the regular grades. Address J. M. Kelley, Jr., Kelly Milling Co., Rochester and Park Ave., Kansas City, Mo.

+No. 1019—Allentown, Penn.—bids on this contract (pp. 77, 157), which provides for furnishing the North Whitehall Township school district with 100 tons of stove and chestnut coal, were all the same, $6.25 per ton, so that the contract was divided equally between the three companies, who were the Balliet Bros. & Co.; R. W. Grammer, and Rockdale Coal Co. Address Secy. A. N. Kuhns, Orefield, Penn.

+No. 1035—Pueblo, Colo.—Thic contract (p. 115), which provides for furnishing the local schools with coal during the ensuing year, has been let in part, the requirements for District No. 20, including all the territory in the city south of the river, involving approximately 400 tons, having been awarded to the **Iron City Fuel Co.** and the **Forbush Fuel & Ice Co.** at $2.10 per ton for Rugby slack, f.o.b. cars, Pueblo. About 2000 tons per annum are required in this district, but the remainder will not be contracted for, purchases to be made in the open market on the prospect of obtaining better prices. On the contract for District No. 1 covering all the cities north of the Arkansas River, and involving approximately 1,600 tons, there were four bidders but no award has yet been made. Address E. J. Scott, Pueblo, Colo.

No. 1125—Columbus, Ohio—Director of Public Service G. A. Borden has awarded this contract (pp. 158,283), as follows: Elk Coal Co., Columbus, approximately 3,500 tons of West Virginia mine-run to the Scioto River Pumping Station at $1.42 delivered on the switch, the Victoria Coal Co., Columbus, approximately 10,000 tons of Hocking nut, pea and slack for the municipal light plant at $1.19, also the 3,000 tons for the Garbage Reduction plant, Hocking nut, pea and slack at $1.19; M. A. Suydam & Co., Columbus, was awarded the contract for about 500 tons for various other city departments, delivered, Hocking lump at $2.17½. There was considerable controversy over these contracts and Director Borden has asked an opinion of the city solicitor if he could award the contract for Ohio-mined coal even at higher figures. The answer was that he was the judge as to the "lowest and best bids." Address Dir. of Pub. Safety B. L. Bargar, City Hall, Columbus, Ohio.

1132—Bloomington, Ill.—This contract (p. 198), which provides for furnishing the local Bd. of Education with approximately 1000 tons bituminous lump coal, has been awarded to the **McLean Coal Co.**, on 2nd or 3rd Vein at $2.75 per ton. Address, Chairman R. E. Williams, Board of Education, 602 Peoples Bank Bldg., Bloomington, Ill.

+1146—Wichita, Kan.—This contract (p. 199), which provides for furnishing the local Board of Education with approximately 2500 tons of coal, has been awarded. The bidders on the contract were: The Central Coal & Coke Co., the Jackson-Walker Co., and the Good-Hillyard Coal & Feed Co. Address Clk. J. L. Leland, Bd. of Edu., City Hall, Wichita, Kan.

+No. 1149—Broken Bow, Neb.—This contract (p. 199), which provides for furnishing Custer County with its coal requirements during the ensuing year, has been awarded to the **Dierks Lumber & Coal Co.**, at $6 per ton delivered in bin at the county courthouse. Address Clk. R. E. Waters, Broken Bow, Nev.

+No. 1150—Muscatine, Iowa—This contract (p. 199), which provides for furnishing the county institutions with 400 tons of bituminous coal, has been awarded to the **Huttig Lumber & Coal Co.** Address County Audr. H. C. Shoemaker, Muscatine, Iowa.

+No. 1153—New Philadelphia, Ohio—This contract (p. 199), which provides for furnishing the Local Board of Education with coal as required during the ensuing year, has been awarded to **John Hale** at $2 per ton delivered in the school buildings. The coal is to be clean and loaded on wagons with a fork at the mine. Other bids received on this contract were: Earnest Carson, 9c. per bu. (80 lb.); Whippoorwill Coal Co., $2.20 per ton and $2.15 per ton where delivery can be made by motor truck; John Marchesi, $2.25 per ton; Brown Coal Co., $2.20 per ton; New Castle Coal Co., $2.25 per ton. Address Clk. A. A. Stermer, Bd. of Edu., New Philadelphia, Ohio.

1163—Carthage, Mo.—This contract (p. 199), which provides for furnishing the local Board of Education with approximately 250 tons of Nevius coal, has been awarded to the **I. C. Wheeler Building & Milling Co.** at $3.15 per ton delivered in the bins. Address Chn. W. F. Maring, Supply Com., Bd. of Edu. Carthage, Mo.

+1164—Fargo, N. D.—This contract (p. 199), which provides for furnishing the local board of education with coal during the year ending June 1, 1916, has been awarded as follows: **Washburn Lignite Coal Co.**, 2000 tons of lignite at $3.15 per ton, delivered; **O. M. Strate**, 200 tons of Pocahontas mine-run at $5.35 per ton. The Dakota Lignite Coal Co. also bid on lignite coal and there were four additional bids on the Pocahontas. Address Secy. E. G. Guthrie, Bd. of Edu., High School Bldg., Fargo, N. D.

1167—Guthrie Center, Iowa—This contract (p. 199), which provides for furnishing the Guthrie County Courthouse with coal during the ensuing year, has been awarded to **Compton & Son** at 15c. per bu. delivered at the Court House. Address W. H. Neal, Bd. of Supervisors, Guthrie County, Guthrie Center, Iowa.

+1174—Canton, Ohio—This contract (pp. 243, 366), which provides for furnishing the local public schools with approximately 2800 tons of coal, has been awarded to the **Steiner Coal Co.** at $2.24 per ton for Crescent No. 8 coal from Belmont County. This company has furnished the coal for the local schools for a number of years and although its bid was not the lowest, it was again accepted this year. Address Clk. W. C. Lane, Bd. of Edu., High School Bldg., Canton, Ohio.

+No. 1176—Topeka, Kan.—This contract (pp. 243, 366), which provides for furnishing the local Board of Education with its coal supply, has been awarded to the **Southwestern Fuel Co.** on the following basis: 200 tons of lump, $3.60; 200 tons of slack, $2.65; 2000 tons of nut, $3.20. Address Clk. M. C. Holman, Bd. of Eud., Topeka, Kan.

1195—Green Bay, Wis.—This contract (p. 244), which provides for furnishing the Brown County Asylum with approximately 600 tons of pile-run bituminous coal, has been awarded to **F. Hurlbut Co.**, at $3.25 per ton for Kentucky Elkhorn coal. Bids were received for the same grade of coal from other companies as follows: H. Barkhausen Co. $3; C. Keiss Co. $3.41; Haevers Co. $3.20. Address Joseph H. Servotte, Bd. of Trustees, Brown County Asylum, Green Bay, Wis.

No. 1199—Chattanooga, Tenn.—This contract (p. 244), which provides for furnishing the city government with approximately 1800 tons of coal for the fire halls, school buildings, and other city buildings, has been awarded to **Church & Co.** Address Comr. E. D. Herron, Dept. of Pub. Utilities, Grounds and Bldgs., Chattanooga, Tenn.

+No. 1205—Uhrichsville, Ohio—This contract (p. 244), which provides for furnishing the Board of Education with screened coal, has been awarded to **C. R. Shipton** at $2 per ton. Address Clk. D. E. Rock, Uhrichsville Village School Dist., Uhrichsville, Ohio.

1206—Sawyer, N. D.—This contract (p. 244), which provides for furnishing and delivering for the county government at this place, approximately 100 tons of lignite, has been awarded to **Jay Sharar**, at $2.89 per ton. Henry Greenwald bid $3 per ton and Henry Buechler $2.90, per ton. Address, Dist. Clk. E. D. Skinner, Sawyer, N. D.

+1207—Cloquet, Minn.—This contract (p. 244), which provides for furnishing the local Board of Education with approximately 500 tons of Pocahontas screened lump coal, has been awarded to **William Kelly**, at $5.23 per ton. William Lane bid $5.25 and J. E. Johnson $5.50 per ton. Address Dist. Clk. L. F. Leach, Bd. of Edu., Cloquet, Minn.

+1209—Wahpeton, N. D.—This contract (p. 245), which provides for furnishing the Richland County commissioners with approximately 300 tons of Pocahontas mine-run coal, has been divided equally between **H. M. Christenson** and **J. E. Morris**, both of whom bid $6.15 per ton delivered. J. B. Lotzer bid $6.25 per ton. Address County Audr. F. A. Burton, Wahpeton, N. D.

1210—Buffalo, Minn.—This contract (p. 245), which provides for furnishing the county government with approximately 100 tons of Youghiogheny screened lump coal, 60 tons of which are to be delivered at the Court House and the balance f.o.b. side track at this place, has been awarded to **Wm. Karb.** Address County Auditor John A. Berg, Buffalo, Minn.

+No. 1214—Dayton, Iowa—This contract (p. 245), which provides for furnishing the Independent School District with coal, has been awarded to **William & Shastrom** at $6.05 per ton for the best Kentucky coal, delivered at the school houses. Address Secy. O. S. Larson, Independent Dist. of Dayton, Iowa.

1218—Mott, N. D.—This contract (p. 245), which provides for furnishing the Mott School District with approximately 250 tons of lignite coal has been awarded to **N. A. Mosher** at $2.50 per ton. Address Clk. R. E. Trousdale, Mott School Dist. Mott, N. D.

+1222—Regent, N. D.—This contract (p. 245), which provides for furnishing the Regent School District with a good grade of lignite coal has been awarded to **N. R. St. Marie** at $2.20 per ton. Address Clk. F. L. Schnebly, Regent School Dis. No. 14, Regent, N. D.

+No. 1223—Missoula, Mont.—This contract (p. 245), which provides for furnishing the local school board with approximately 500 tons of coal, has been awarded to the **Perry Coal Co.**, at $5.55 per ton for special Round-Up lump coal delivered at the school buildings. Address Clk. M. R. Hardenburgh, School Dist. No. 1, Missoula, Mont.

1228—Johnstown, Penn.—This contract (p. 245), which provides for furnishing the Board of Education with coal during the ensuing year, has been awarded as follows: **Charles P. Bender**, First District, $1.43 per ton; **Prosser-Thomas Coal Co.**, Third District, $1.50 per ton; **Charles P. Bender**, Second District, $1.40 per ton. There were nine bidders on the contract. Address Secy. Charles H. Meyer, Bd. of Edu., 601 Swank Bldg., Johnstown, Penn.

+1231—Wilkes-Barre, Penn.—This contract (p. 245), which provides for furnishing coal for the 23 school buildings of the local school district, during the ensuing year, has been awarded to **W. G. Downs** as follows: Schools Nos. 1, 2, 3, 4 and 5, $4.20 per ton; No. 6, $3.20; No. 7, $2.40; No. 2 (buckwheat), $1.63; rice, $1.12. Address Secy. W. H. Morris, 58 Lee Park Ave., Hanover Township, Penn.

+1233—Dickinson, N. D.—This contract (p. 283), which provides for furnishing the local School Board with approximately 500 tons of mine-run coal, has been let to the **Oakota Lignite Mines Co.**, at $2.18 per ton for lignite delivered to the school buildings. Address Clk. L. R. Baird, Bd. of Edu., Dickinson, N. D.

+No. 1244—Delaware, Ohio—This contract (p. 284), which provides for furnishing the County Commissioner with 240 tons of 3-in. coal and 40 tons of washed nut, f.o.b. cars, Leonardsburg, Ohio, has been awarded to **S. C. Kissner & Sons.** Address County Audr. W. D. Aldrich, Leonardsburg, Ohio.

No. 1245—Missoula, Mont.—This contract (p. 284), which provides for furnishing between 250 and 300 tons of coal for the high school building, has been awarded to the **Perry Coal** Co., on Bear Creek lump, at $6.10 per ton. Address Secy. A. J. Violette, Bd. of Trustees, County High School, Missoula, Mont.

+1246—Fairmont, N. D.—This contract (p. 283), which provides for furnishing the local School Board with two carloads of stove coal, has been awarded to the **Sulzer Lime Co.** at $9.45 per ton delivered in bins during August and $9.50 per ton in January. Turback Bros. bid $9.70 and Elliott Elevator Co., $9.50 on track. Address Clk. F. E. Crafts, Bd. of Edu., Fairmont, N. D.

+1248—Lake Park, Minn.—This contract (p. 284), which provides for furnishing the local Board of Education with coal, has been awarded to **E. T. Viger & Son,** at $5.19 per ton for Hocking lump coal. Address Secy. Kristofer Delager, Bd. of Edu., Lake Park, Minn.

1250—Falls City, Neb.—This contract (p. 284), which provides for funrishing the local Board of Education with approximately 500 tons of coal, has been awarded to **I. C. Maust** at: Weir City nut, $4; Breese 6-in. lump, $4.25. Quotations include cost of delivery in bins, some of the buildings requiring a haul of a mile and a half. Address Secy. F. Brecht, Bd. of Edu., Falls City, Neb.

+No. 1253—Stanley, N. D.—This contract (p. 323), which provides for furnishing the Montrail County Court House with coal as may be required during the ensuing year, has been awarded to the **Nelson Grain Co.,** at $3.10 per ton for lignite coal delivered in the bin. Address County Audr. H. P. Duggan, Court House, Stanley, N. D.

Contract Notes

Albert Lea, Minn.—The contract for furnishing the County Poor House has been awarded to the **Speltz Grain & Coal Co.**

Dickinson, N. D.—The contract for furnishing the Dickinson schools with 500 tons of coal was let to the **Dakota Lignite Co.,** at $2.18 per ton. Lignite mine-run was specified.

New Orleans, La.—William Garrigue Co., Gretna, La., Swift & Co., Harvey, La., and the Westwego Ice & Bottling Works, Westwego, La., recently started using oil instead of coal.

Argenta, Ark.—The contract for furnishing 100 tons of the best domestic lump for the city schools has been awarded to **J. Y. Worthan** at $4.25 per ton delivered in the bins. Other bids ran as high as $4.40.

Crookston, Minn.—Sargent & Hanna, of Grand Forks, have been awarded the contract for furnishing the public school buildings of the city with coal for the fall and winter term, their bid being $4.54 per ton.

New Orleans, La.—The New Orleans Industrial Alcohol Co. has opened a new factory at Westwego, La., across the river from New Orleans, and will be in the market for coal very shortly. Address, New Orleans Industrial Alcohol Co., Westwego, La.

Lewiston, Idaho—The Idaho Ice & Cold Storage Co., who are mine agents for several Wyoming and Utah coals announce an advance of 25c. per ton, which is an unusual condition at this time of year. No reason for the advance has been given.

Springfield, Minn.—The contract for furnishing the local Board of Education with 125 tons of Hocking Valley screened lump coal has been awarded to **Charles Davin** at $5.50 per ton delivered in the bin. Address Clk. John Schmelz, Bd. of Edu., Springfield, Minn.

Louisville, Ky.—Strater Bros. Tobacco Co., at this place, consumes about 200 tons of Kentucky pea and slack coal per annum. Deliveries are made by wagon at the rate of approximately 6½ tons a day. Address Purchasing Agent, Strater Bros. Tobacco Co., Louisville, Ky.

Hillsboro, N. D.—The prices at which the contract for furnishing the local power house with coal during the ensuing year (p. 246) was awarded were: Youghiougheny pea, $3.10; Elkhorn screenings, $2.65. As previously noted, the contract went to the **Hillsboro Lumber Co.** Address City Audr. N. G. Nyhus, Hillsboro, N. D.

Philadelphia, Penn.—The Bernstein Mfg. Co., at this place, consumes approximately 1500 tons of bituminous coal. Deliveries are made by railroad at the rate of 125 tons per month. The company has storage capacity for 75 tons. Address, Pur. Agt. H. W. Schob, Bernstein Mfg. Co., Third and Allegheny Ave., Philadelphia, Penn.

New Orleans, La.—The contract for supplying the Tulane University and Newcomb College with coal during the ensuing year has been awarded to the **R. P. Hyams Coal Co.** The tonnages involved are 590 tons of steam coal, 175 tons anthracite, 1,000 barrels gashouse coke. Address Pur. Agt. F. D. Layman, Tulane Campus, New Orleans.

Topeka, Kan.—The State Board of Control has awarded a contract for furnishing the State Charitable Institutions with approximately 60,000 tons of coal to the **Topeka Cold Storage Ice and Fuel Co.,** at $1.74 per ton for domestic coal and $1.34 per ton for slack. It is provided that all the coal must be deep-mined. The price is slightly under the figures for last year.

New York—The Commissioner of Docks and Ferries opened bids on Sept. 7 for furnishing and delivering 15,000 gross tons of No. 1 buckwheat and 6,000 tons of semibituminous coal at such times as may be directed. Meeker & Co. and Pattison & Bowns bid $2.89 per ton on both the buckwheat and bituminous, and Charles D. Norton & Co. bid $2.68½ per ton on the same. For previous purchases of this department during the current year, see contracts Nos. 48, 373, 935, 1068, and contract note, Vol. 8, p. 286. Address Comr. R. A. C. Smith, Dept. of Docks and Ferries, Pier A, foot of Battery Place, New York City.

Railroad Storage—The various railroads are continuing to pile up coal in anticipation of possible labor disturbances. The Pennsylvania R.R. in addition to storing coal at East and South Altoona is also putting in stock a large quantity in the Enola freight yards near Harrisburg, and is arranging for the storage of anthracite at Lock Haven and Sunbury. The Lehigh Valley is filling its plant at Hudsondale, and is also arranging to fill the old Black Creek Junction plant. In addition to the large stocks of anthracite which they always carry, the Reading is storing bituminous coal in the vicinity of Pottsville and at other points along the line.

Columbus, Ohio—A strong protest has arisen among the people of the state over the award of the contract for 15,000 tons of coal for the Ohio State University for coal to be mined outside of the state (p. 286). The contract was awarded to the Lorain Coal & Dock Co., of Columbus, for Logan County (W. Va.) coal. Governor Willis, who has been taking a leading part in the "use Ohio coal" campaign, is very much worked up over the award and he is trying to get the successful bidder to agree to secure a portion of the tonnage from Ohio. The trustees of the Ohio State University claim that the B.t.u. test showed the samples of Logan County coal to be the best.

Foreign Notes

St. Michaels, Azores—Coal is selling as high as $12.90 a ton at this place.

Azores—Another order for 3,000 tons of American coal has been placed by local dealers for delivery in schooners. Several schooners have been employed in the trade in recent months. The quickest voyage was 25 days. Freights are $6 to $7.50 per ton.

Russia—An American consular officer in Russia transmits the name and address of a railroad official who desires to receive names and addresses of American producers and exporters of coal who are in a position to ship coal to Russian Black Sea ports at the conclusion of the war.

Brazil—A firm of commission agents in Brazil informs an American consular officer that it would be pleased to represent American manufacturers and exporters. One member of the firm has had considerable experience in the sale of coal and desires to make a specialty of this. Other lines are not specified. Correspondence may be in English.

Chile (July 16)—Scarcely any business has been done in coal during the past fortnight, and the few transactions effected were: Part of a sailer cargo of Seaham, May sailing, was resold at $9.12 for Antofagasta, and a small lot, same class, July sailing, at $9.73 for Iquique. A steamer cargo of Pocahontas, August sailing, was placed at $9.73. We quote Australian at $9.73 to $10.95, according to class, port and sailing.

London, England—Philadelphia export shippers of bituminous coal have been surprised to receive inquiries for shipments to Liverpool, England. It has been known for some time after Aug. 13 the British Government would prohibit the export of coal from the British Isles and it was presumed that they would then be able to take care of all demands for domestic consumption. The shortage is probably due to the fact of so many of the English and Welsh miners have enlisted, and an increased quantity is necessary for the warships and munition plants.

COAL AGE

Vol. 8 NEW YORK, SEPTEMBER 25, 1915 No. 13

Improved Outlook in Coal Mining

> *OPTIMISM prevails in the coal and coke industries. The feeling of pessimism so prevalent among mining men a few months ago has largely disappeared. This change for the better is based on an actual improvement in the nation's fuel situation and is widespread. If present prospects are realized, the coming winter will show greater prosperity to coal men than they have experienced in years.*

ANTHRACITE shipments for the first eight months of the current year are 2,000,000 tons less than last year. It will require active fall mining to overcome this deficiency. Consumers have hesitated more than usual and customary surpluses have not been accumulated.

Bituminous shippers are very conservative over future commitments. The export trade is most certain to prove a potent factor in the domestic market. European demands are increasing. Vessels bunkering are taking double tonnages for the round trip.

Steel mills in the Pittsburgh district are producing a greater tonnage than ever before in their history, and coal and coke consumption in this line is at a record rate. Coal prices have stiffened generally, and further important advances will result in case of a car or labor shortage, both of which seem imminent.

Large steam consumers throughout the country are disposed to cover their fuel requirements against a possible price increase. Important railroads are accumulating reserve supplies. The first general cold snap will precipitate a vigorous buying movement.

Tonnage statements of the big coal carriers are also showing a substantial increase. For example, the Norfolk & Western coal shipments increased from 2,200,000 tons in April to 3,000,000 tons in August. The Chesapeake & Ohio is showing a similar well-sustained improvement, while the Baltimore & Ohio is moving coal at the rate of nearly half a million tons per month more than during last year.

Even in Ohio the coal industry has taken on a new lease of life. The average percentage of operations for all Ohio districts has jumped from 34 per cent. to 47 per cent. full-rated capacity.

About two weeks ago "Coal Age" asked 1000 prominent coal-mine owners and managers to forecast business in their fields this fall and winter. The replies are from every coal state in the Union and are almost universally favorable. At this writing 102 forecasts have been received, of which number 89 companies anticipate good business this fall and winter. When it is remembered that coal men generally are not a hopeful lot, the overwhelmingly optimistic opinions are significant.

Subsequent issues of "Coal Age" will give a detailed analysis of the American coal situation and prospects as viewed by the important men in the industry itself.

Ideas and Suggestions

Putting the Old Men Out

In our present-day industrial life efficiency is the watchword everywhere. To produce this a process that we might call "put the old men out and the young ones in" is often ruthlessly employed.

A famous scientist recently declared that about 60 years is the limit of a man's usefulness. He established this arbitrary line as a basis to determine the fit from the unfit, but we fear his deductions were drawn from too little experimentation. Probably using 60 years as a limit was intended to incite and stimulate the contented middle-aged man to work for a vigorous old age.

In the coal-mining industry we have today and have had scores of recognized men who do things and see that things are done who are well past the 60-year mark. Because of their lessened physical resources let us not forget their vigorous mental powers, their tempered sense of duty and their precious practical knowledge gained in the school of life.

The older men have made our prosperous institutions what they are and the younger ones should not be too eager to depose them, as their time to prove their worth will also come. Let every employer judge his employee solely by efficiency, not age.

⁂

Human Equation in Mining

By Forney L. Parker

In transporting coal from the solid to the breaker it is human power rather than mechanical power that does the essential work, and yet it often happens that more consideration is given to the mechanical machine than to the human machine. We strive to keep our mechanical devices efficient by painstaking tests and records, while man is allowed to choose his own groove and follow it.

We keep cost sheets and records of coal produced per man and per period of time, but we have only a general idea of the hundred-and-one details that occur in getting the coal from the solid to the mine car. For instance, a breastman working in a pitching and gassy seam will often carry a poor brattice because he thinks it will take too much time to make it air-tight, or because the buddy who taught him mining did it that way. The result is that as the face progresses the air short-circuits through the leaky brattice and his place will be blackened with gas, which not only means a loss of time and money to himself but also a loss of perfectly good coal to the company. If the miner had received the proper instruction or his place had received adequate inspection while he was at work, this would not have occurred.

It is well for the superintendent to study the attitudes of his employees. Attitude is rather hard to define. By a bad attitude we mean laziness, shiftlessness and lack of interest, while good attitude we designate as industry, application and enthusiasm. These bad attitudes are developed by circumstances and by following the line of least resistance, and unless a strong influence is exerted to change them we cannot have the efficient employee.

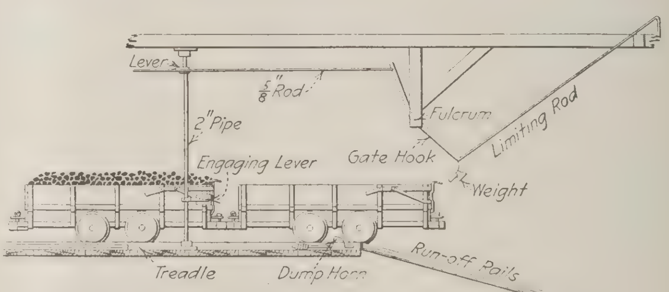
To give the employee sufficient motive to accomplish his task in a thoroughly efficient manner, wage probably has more influence than anything else. It is hope of reward rather than fear of penalty that brings forth the best efforts in the miner. While increase of wages, which is probably best accomplished by the bonus system, is the most effective, a comfortable home, with congenial surroundings and pleasant diversions, will furnish good incentives for efficient work.

When an individual is brought to a realization of the interest that is being taken in his welfare he will give his full measure of devotion to his work, and not before.

⁂

Automatic End-Gate Lifter

The accompanying sketch illustrates a simple method of automatically releasing the gate of a mine car after it has been dumped and is in the act of being replaced by a loaded car on a Phillips crossover dump. The advantage of the method shown over that of the overhead lever which drags over the coal topping, similar to that submitted by A. W. Hesse in *Coal Age*, No. 9, Vol. 8, is that no coal is scraped off in front of the dump when used at mines where the coal is built up above the top board of the car.



SHOWING DETAILS OF END-GATE LIFTER

The arrangement here depicted is now being used at Mine No. 2 of the Wasson Coal Co. in Saline County, Illinois, and operates in an entirely satisfactory manner.

The exact method of installing this release may be varied to suit the material at hand. In the installation referred to the gate hook is of a common type and is made of 2x½-in. iron. This is suspended so that its normal position is not quite vertical when ready to engage the hook on the mine-car gate and is fitted with a small weight to assist its quick return to engaging position, being limited in this movement to the proper position by the limiting rod, which is ½ in. in diameter, bent into a hook which passes over a timber. The vertical axle, to which are connected the arm which the cars strike and the lever which swings the hook back by its pull on the

⅝-in. connecting-rod, is a 2-in. pipe set in end plates. Both levers are 2x½-in. iron, bent to fit the pipe and fastened to it by through bolting.

The position of the vertical axle must be such that the "engaging" lever is struck by the front end of the car as soon as the treadle rail is depressed and the horns spread to release the empty car. The length of the levers will depend on local conditions. Although it might appear that the connecting-rod pulling at an angle would give trouble, as a matter of fact in the installation mentioned the operation is smooth and quick and can be worked by hand.

⁂

Coal Should Be Mined but Once

By N. G. Near

After coal is once dug out of the ground by the laborious process of mining, it should never be allowed to touch the ground again; at least it should not be handled by hand again, for hand labor is inefficient.

From the minute the coal is thrown into the mine car it should be in a state that permits of mechanical handling. If coal is dumped onto the ground at any time and must be shoveled by hand, the mining process is virtually repeated, and it is that process which makes coal most expensive.

No matter what your business—mine operator, middleman or retail coal dealer—bear this principle in mind: Coal should be mined only once.

⁂

Time Wasters

By Pennsylvania Engineer

Almost every mining town contains a certain proportion of inhabitants who are time wasters. They are generally in evidence close to the company store or at some other central point where they are sure to find others of their kind.

The time wasters are a purposeless crew. They are generally devoid of any desire to get ahead, and make no effort in that direction, even though their talk often indicates that they are highly dissatisfied with their condition. However, instead of putting their time to good use, they find it more to their liking to give vent to their thoughts and opinions in the presence of others like themselves who feel that they have nothing better to do than to listen to them.

Self-Praise the Common Vocation

The talk of the time wasters covers a wide variety of subjects. A topic of prime interest concerns the operation of the mines; the inevitable mistakes of the superintendent or the mine foreman are subject to the most minute examination and criticism. Any one of the time wasters could tell how to avoid these mistakes and how to operate the mines more economically and efficiently. Another subject of great importance to each speaker is his own special ability in some particular branch of mine work. In his enthusiasm this fellow is quite apt to spread his praise of himself over so many different kinds of work that even his easygoing hearers lose patience. Moreover, his story is not told once but on every possible occasion when he can get away with it. In fact, the whole tendency of the time wasters is to lose their sense of proportion, which results in their greatly exaggerating things of slight importance.

Serious discussion makes for strengthened brain power, and it likewise awakens clear thinking. The difficulty is, however, that the environs of the store corner and the usual dispositions of the time wasters do not contribute to helpful discussion. A combination of narrowness, unenlightened opinion and a certain amount of profanity does not constitute serious talk, however forceful the speaker. An open-minded, thoughtful discussion of some matter of vital concern is not what is wanted by the time wasters; it is more spicy, and productive of further comment, to hear someone break in with remarks of a prejudiced nature.

Ambition Is Ridiculed

The meetings of the time wasters are not without their amusements. Many funny events occur every day which furnish subjects for conversation. The fellow who occasionally makes a foolish mistake comes in for his share of the laughter. The time wasters also derive much amusement from the comments concerning the more ambitious element of the town. If there happens to be a night school in session, it is real sport, in their opinion, to pass remarks about the "school boys" as the latter go by on their way to the classroom. The best feature of this "fun" is the fact that it is continuous. As the "school boys" improve their opportunities and make their way forward and upward their places are filled in the school by other ambitious lads, and they in turn become the object of comments by the same old crowd of time wasters who remain stationary at the corner store.

The disadvantage that comes to the time wasters is of course mainly in the opportunities lost during the periods that could have been devoted to some more helpful occupation. The hours that could have been used making improvements about the home, in reading or in study are gone. That is unfortunate; but there is another feature that is as bad, if not worse. The time wasters by their continued presence in their favorite haunts encourage their younger hangers-on to become confirmed in the same state of inefficiency. These lads look forward to the time when their opinions will be listened to and they may claim their regular places with the others.

Public opinion cannot hold the time wasters in high regard; nor can the officials of corporations look to them when choosing men for promotion. It is a well-founded assumption that any man who wastes his time in listless gossip at the corner store is not fitting himself for advancement. And in the present day, when night schools are more widely established, when excellent textbooks may be obtained and when the technical press supplies papers suited to almost every industry, the time waster is looked down upon more than ever.

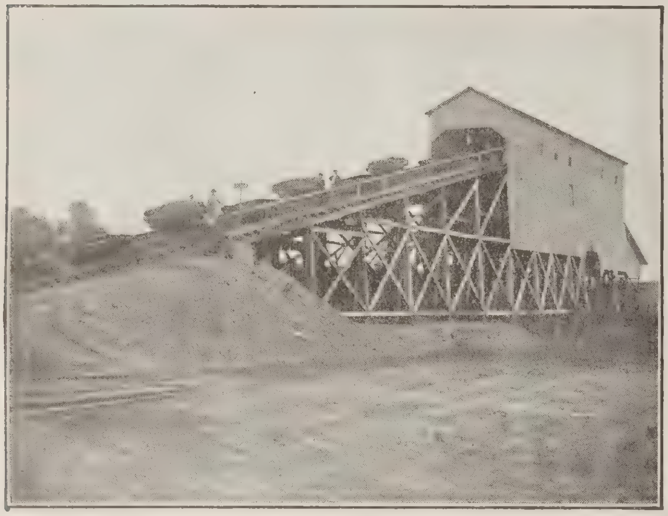
⁂

Miner's Helper as Operator's Employee—Helpers employed by miners with the operator's permission are entitled to the same degree of consideration from the operator as to their safety as is due the miners, where it appears that the operator keeps account of coal loaded by the helpers and pays them, deducting the amounts due them from the amounts due the miners, and that the helpers are subject to the control of the operator the same as the miners. (Kentucky Court of Appeals, Small vs. Borderland Coal Co., 170 Southwestern Reporter 8.)

A Slope Mine in Illinois

SYNOPSIS—Contrary to the usual custom in Illinois the coal is reached at this operation by means of a slope. Loaded and empty car-hauls driven by an electric motor take the place of hoisting engines and cages, with a considerable saving as well as greater safety and convenience.

The Wasson Coal Co., of Harrisburg, Ill., is one of the few coal companies in the Middle West that has been prospering and opening up new fields during the last year. The stockholders have received substantial dividend checks regularly; large sums have been spent for improvements in the old equipment, and a new mine has been developed and equipped during this time. All this goes to show what it is possible to accomplish by good management and an efficient organization such as this company has developed.



THE CAR HAUL IN OPERATION

In the equipment of the new mine, which will have an output of about 2,000 tons per day, the management has indicated its progressive disposition by a radical departure from the established custom of sinking vertical shafts. An incline was driven to the coal and a car-haul installed to bring the pit cars from the mine to the tipple. So far as is known this is the only installation of its kind in the Middle West. There are car-hauls, however, which are entirely above ground or in connection with drift mines.

This plant is situated on the open prairie, a condition typical of most Illinois mines. The management was fortunate in locating a spot where the coal "crops out" to within about 30 ft. of the ground surface and where it has a good slate roof. The coal seam is about 4½ ft. thick and although on a gradual slope, the haulage, handled by locomotives, is not hampered.

The accompanying view of the No. 2 mine shows the car-haul in operation. This haul is also of interest, in that it is one of the largest in operation in the whole coal-mining industry. It is constructed of two high-grade steel chains, one for the loaded cars and one for the empties, operated by a 75-hp. motor. The motor is controlled by the men in the weighhouse, who start and stop the haul when under full load, as required to accommodate the men that load out the railway cars. The empty haul is driven by chain and sprockets from a countershaft of the loaded haul.

The chain on the loaded haul operates at a speed of 60 ft. per min. It is on an incline of 14 deg. 30 min., has a working stress of 25,000 lb., and is equipped with four-wheel gravity tilting spurs. This chain is 18 in. pitch, every second link being composed of drop-forged steel. The alternate links consist of two "30 to 40 carbon" steel bars. The pins are of 1¾ in. diameter.

The chain was designed for the working load given, on a conservative basis, and large factors of safety were employed. Safety dogs have been provided on the supporting structure of the loaded haul. If a car should get away and start down the incline, it could not go more than a distance equal to a little over its own length before engaging one of these stops. The length of the haul is 365 ft. from center to center of head and foot shafts.

The chain on the empty or down-haul operates at a speed of about 85 ft. per min. and is also equipped with four-wheeled gravity tilting spurs. The distance center to center of head and foot shaft is 325 ft. The chain is made of high-carbon steel bars.

A caging device is provided at the foot of the loaded haul, thus making it possible for a man to deliver cars to the haul, one at a time, at proper intervals to engage every spur on the chain. The track in the entry is on a slight grade to this caging device, while the track leading from the empty haul is on a slight inclination back into the entry. These grades favor the haulage locomotives materially. At the head of the hauls, in the tipple, a crossover dump and kick-back are provided.

The points that the operators claim in favor of this equipment are:

1. First cost is no greater than that of hoisting engines, cages, etc., necessary for a vertical shaft.
2. The services of a hoisting engineer are dispensed with.
3. The miners walk into the mine through a passage alongside the haul and are not subject to dangers of falling cages, etc.
4. The men are free to enter and leave the mine at will, without waiting for a hoist.

This haul was designed and furnished by the Jeffrey Manufacturing Co., of Columbus, Ohio, which makes a specialty of coal-handling equipment.

⁂

Coal Production of Kansas

The production of coal in Kansas in 1914 amounted to 6,824,068 short tons, according to the Geological Survey, with a value at the mines of $11,181,687. This is a decrease of 5 per cent. in quantity and 7 per cent. in value from the output of 1913. In other respects, however, the year is reported to have been satisfactory to the coal men, no serious strikes or flooding of pits having interfered with coal mining in the state during the year.

Some improvement in the dangerous practice of shooting from the solid is shown for Kansas, the coal mined by this method in 1914 being 77.3 per cent. of the total output as compared with 80.5 per cent. in 1913.

The number of men employed in the coal mines of Kansas in 1914 was 12,413, and they worked an average of 191 days against 12,479 men for an average of 197 days in 1913. The average production per man in 1914 was 550 tons and 2.88 tons for each working day.

Large Stripping Operation

By Frank H. Kneeland

SYNOPSIS—At Ebervale, Penn., a bed of coal which was abandoned many years ago—being supposedly worked out—is being in large measure reclaimed by stripping. Unlike most operations of this kind, this work is being done on a salvage basis. Under present conditions by using modern methods as much as 8 cu.yd. of earth may be moved in order to secure 1 cu.yd. of anthracite coal.

The surface mining or quarrying of coal is probably the oldest form of coal production. Like most other forms of mining, however, it has undergone considerable development from the primitive methods at first employed in this operation.

The usual conception of a strip pit is that the coal occurs under shallow cover, which may easily be removed by means of horses and carts, wheeled or scoop scrapers, or even by wheelbarrows. Of late years, however, the steam shovel has been used with great success in stripping operations and has rendered possible the extraction of coal which could not be secured by any other means. Furthermore, some modern strip pits could hardly be termed shallow.

At Ebervale, near Hazleton, Penn., the Central Pennsylvania Quarry, Stripping and Construction Co. is engaged on what is called its No. 5 coal job for the G. B. Markle Co. This is one of the most extensive and most costly stripping operations in the United States, as well as being the only one worked on a salvage basis.

In the vicinity of Hazleton the Mammoth or Big vein of anthracite lies in a basin in the bottom of a valley, upon either side of which it outcrops. This coal measure was one of the first, as well as one of the richest, to be worked in the anthracite region, and the particular property in question was worked out and abandoned many years ago. At this point the Mammoth coal bed is approximately 30 ft. thick. Beneath it lies the Wharton vein, which is about 4 ft. thick and of slightly inferior quality. The Wharton is separated from the Mammoth bed at Ebervale by a stratum of rock about 12 in. thick. East and west of this point, however, this rock increases up to between 6 and 8 ft. in thickness.

As has been said, the coal at Ebervale had been worked out and abandoned many years ago. The headings and breasts of the original mine were driven in the Mammoth vein and on account of the weak roof the miners were compelled to leave the top benches of this measure. Consequently the breasts driven were 30 ft. wide and 18 ft. high. Furthermore, as the breasts approached the outcrop the cover became too thin and broken to be readily supported, and they were consequently abandoned some distance from the actual outcrop. The Wharton vein was untouched in the original workings.

It will thus be seen that as a matter of fact the basin at Ebervale contained a considerable amount of perfectly good coal at the time it was abandoned. In the Mammoth vein this consisted of the top and bottom coal of breasts and entries, all pillars, and a strip of virgin coal around the outcrop that could not be safely mined by underground methods. It also included the entire contents of the Wharton coal bed.

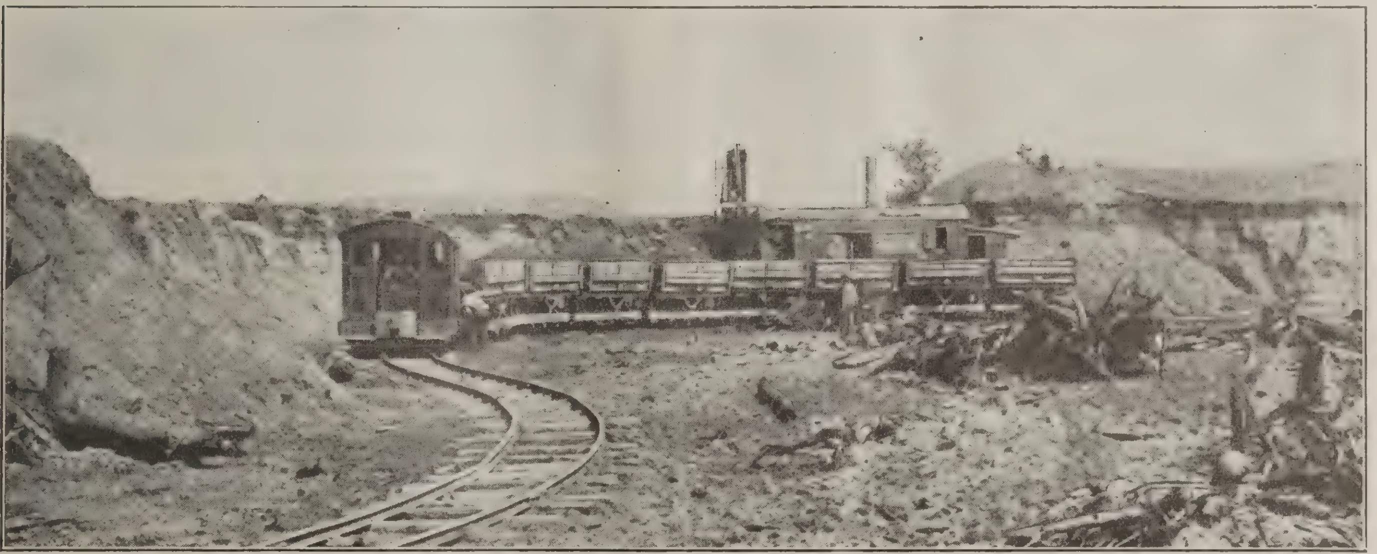


FIG. 1. A STEAM SHOVEL REMOVING CULM FROM A LARGE BANK AT EBERVALE

After being abandoned, the old workings in many instances caved in and became filled with broken rock, clay and silt. The ground above the old mine, except that which was covered by a culm bank, supported a considerable amount of second-growth timber, but was full of cave holes, marking where rooms or breasts had been driven. As it was believed that the available mineral wealth of this property had been exhausted, the land above the old workings lay utterly idle, as it was neither safe for building purposes nor fit for cultivation.

The owner of this land found himself in a predicament. His property was taxable but nonproductive, nor except

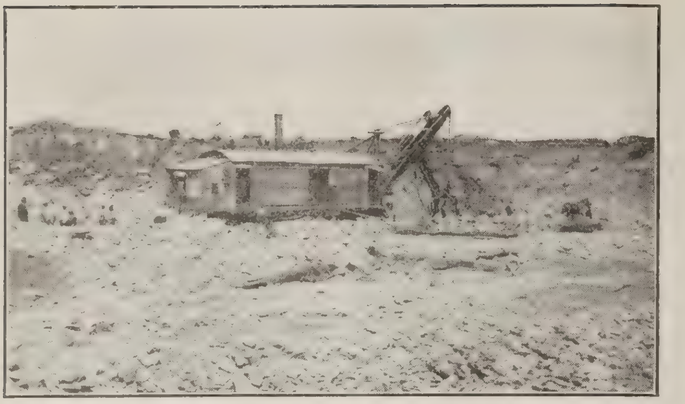

FIG. 2. A STEAM SHOVEL AT WORK IN STRIPPING

for the culm bank previously mentioned was there reason to believe that it might ever become otherwise, or at least not within the span of ordinary human life.

Then about four or five years ago David Benjamin and Charles E. Butler, operating heads of the Central Pennsylvania Quarry, Stripping and Construction Co., men of wide experience in the stripping of anthracite coal, got an idea and simultaneously an inspiration. After carefully going over the ground and learning all the facts so far as possible, they came to the conclusion that with prices and market conditions then prevailing the coal still remaining in this abandoned property could in large part be successfully reclaimed on a salvage basis. They accordingly entered into a contract with the G. B. Markle Co., which held a lease to the property, whereby they were to strip and deliver the product to the nearest Markle breaker, receiving therefor a certain price per ton.

Stripping was started July 11, 1913, and the first coal was sent to the breaker on May 9, 1914. Thus almost a year of steady outlay, amounting to about $200,000, and the moving of 1,000,000 cu.yd. of material were required before one cent was realized. At the present writing the center section of this stripping is 1500 ft. long, 800 ft. wide and has a maximum depth of approximately 160 ft.

The culm bank previously referred to is now being removed by steam shovel and prepared for market. This culm consists mostly of small sizes of coal, and only a small percentage of the entire bank is as large as chestnut. The ground upon which it is located will eventually be stripped, as well as a large portion of the remainder of the property.

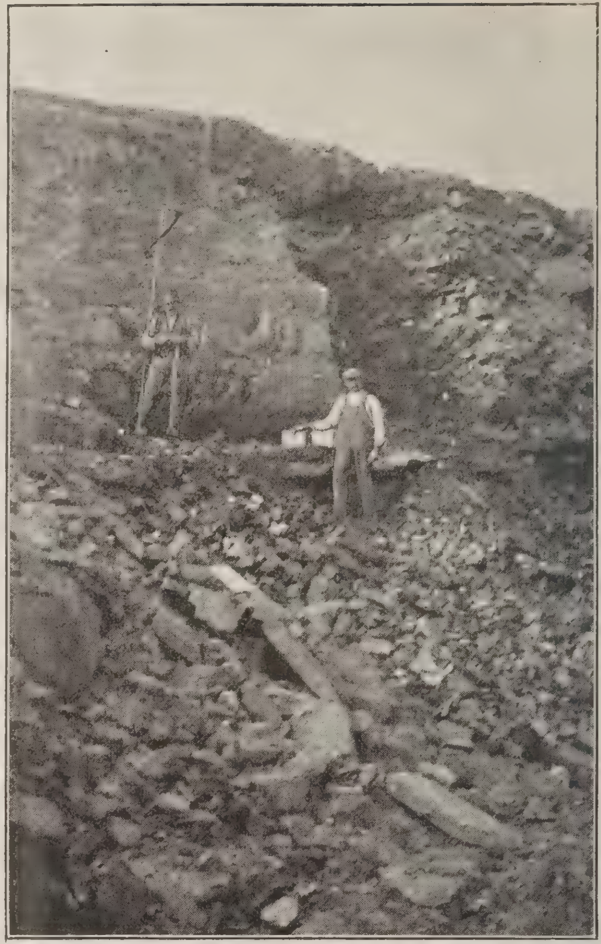

FIG. 5. PREPARING TO "SPRING" A HOLE BEFORE BLASTING PILLAR OF COAL

The stripping of an old mine is accompanied by many difficulties and dangers not encountered in removing the cover from virgin coal. Much of the ground over entries, rooms and breasts has caved in. Sometimes this breaking of the strata continues to the surface, resulting in a cave hole. In other instances the caving extends only part way up. In case the caving is complete, resulting in a hole or depression on the surface, the ground where the cave has taken place is always soft, yielding and treacherous. It often becomes necessary in such a place—over which a steam shovel must operate—to cover the caved ground with a mat of poles. Sometimes one set of such poles, 6 to 8 in. in diameter, laid parallel to each other and from 12 to 24 in. apart, is sufficient to support the weight of the shovel. Often, however, two

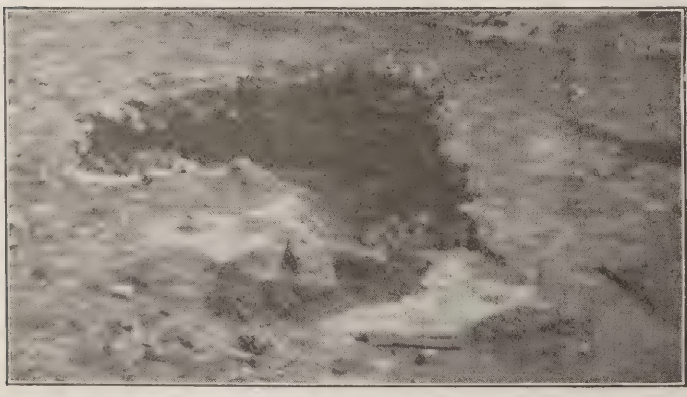

FIG. 3. RESULT OF CAVING UNDER THE SIDE JACK OF A STEAM SHOVEL

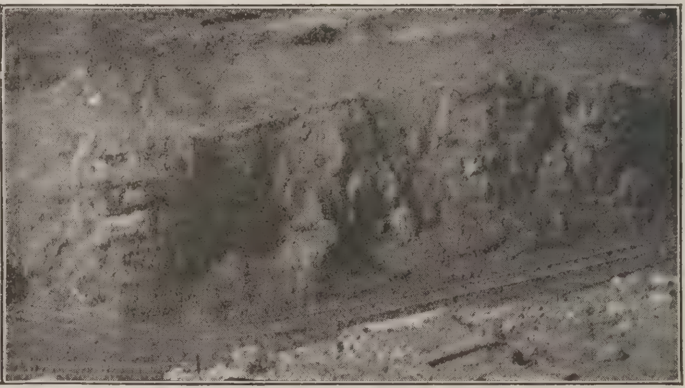

FIG. 4. PILLARS OF COAL ALTERNATING WITH OLD BREASTS FILLED WITH CLAY AND ROCK

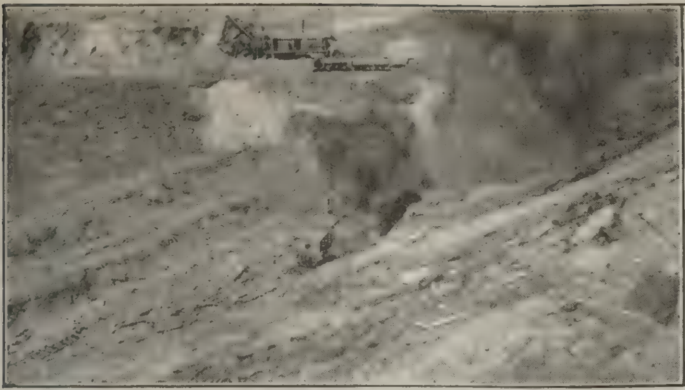

FIG. 6. "MUD CAPPING" HARD ROCK IN FRONT OF A SHOVEL

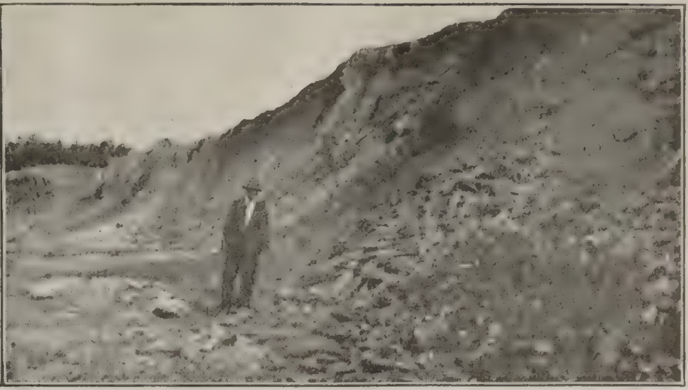

FIG. 7. PRACTICALLY VIRGIN COAL NEAR THE OUTCROP

or three sets laid at right angles to each other are required. Of course after they have served their purpose these poles may be pulled out and used over again in a similar contingency.

Sometimes the caving of an old breast may not extend entirely to the surface, giving no indication of danger. Under the weight of the steam shovel, however, particularly under the action of the side jacks, such ground is liable to cave suddenly, either engulfing the shovel or tipping it over. It is sometimes possible, however, where the caving takes place under a side jack, to catch the machine and prevent its leaving the rails by quickly pushing against the ground with the dipper. Bad accidents and nasty upsets have more than once been prevented by this method.

Ten Men Make Up a Shovel Gang

At Ebervale each steam shovel is operated by a gang consisting of 10 men. This includes one shovel runner, one craneman, one fireman, four jackmen, one coal man, one spotter and a night watchman. The shovel runner and craneman control the movements of the dipper. The runner operates the engine which raises and lowers the dipper, as well as the one which swings the boom. The craneman operates the crowding engine, thus regulating the depth of the cut taken by the dipper, removing it from the bank when it is full. He also trips the bottom, which discharges the dipper contents at the proper time. As the output of a shovel depends entirely on the combined skill of these two men, they learn to work in what might be termed synchronism, each performing his duties in perfect conjunction with the other.

The engineer or shovel runner is in charge of the shovel. He sees that the jackmen have the road ready in front of the shovel so that no time is lost in moving up to new work, also that the jacks are properly placed and tightened and that care is exercised in moving. The fireman not only keeps up steam but in large measure cares for the hoisting and swinging engines. He sees that the machinery is properly oiled, that grease cups and lubricators are kept full and that proper water connections are made and maintained.

To the coal man is intrusted the duty of keeping the shovel supplied with fuel. Before the coal was reached at this operation fuel was hauled to the shovels in carts. Since that time, however, it has only been necessary for the coal man to pick up and carry the needed amount of coal to the shovel. As the quantity of this fuel-coal is almost infinitesimal as compared with that produced, it is furnished gratis by the owner of the property.

The material excavated by the steam shovel in stripping the coal measure is hauled to the dump by "lokies"—small steam locomotives—each handling a trip of from five to eight cars of 4-cu.yd. capacity each. The runner or engineer usually has a fair knowledge of the mechanism of his engine, and as severe grades are encountered, no small amount of skill is required to haul or push the cars over them. Each lokie runner does his own firing.

The "spotter" is a signal man. He indicates to the lokie runner the exact position in which to place each car at the steam shovel in order that it may be most advantageously loaded. He also removes from the cars dangerous overhanging material and cleans the track of rock and dirt spilled upon it.

Of course in a strip pit the roads have to be changed frequently; consequently a gang of roadmen is kept busy

either building new tracks or repairing those which have become defective. Considering the temporary nature of the trackage, little trouble is experienced from derailments.

When a trip of loaded cars reaches the dump or spoil bank, a dump gang, consisting of eight men, quickly discharges the contents of the entire trip. The cars are of the side-dump variety and can discharge from either side. All spoil banks are so located that they will never interfere with possible future operations.

After the dirt has been removed from above the coal the latter is loaded into cars by means of steam shovels. Of course it is impossible in an operation like this, where a part of the coal has been removed by underground mining, to avoid a certain admixture of clay and rock. If the proportion of rock is above a certain amount the material is sent to a separate spoil bank which will eventually be worked over, the material being washed and otherwise mechanically prepared for market. This spoil bank is estimated to contain about 40 per cent. of coal, the remainder being dirt and rock.

As was stated, the Wharton coal bed, about 4 ft. thick, underlies the Mammoth, being separated therefrom by from 12 to 18 in. of slate. The Wharton vein contains a hard and tough black rock parting, locally known as "the nigger." This as well as the slate separating the two measures and the hard strata, sometimes encountered above the coal, is too tenacious to be readily dug by the shovel. These strata are therefore shattered with dynamite and powder and both coal measures loaded together.

To prevent an excessive amount of rock being loaded with the coal, two or three trimmers are employed at each coal-loading shovel. They pick the larger pieces of rock from the coal as the material is loaded. Of course the shovel operators become quite skillful in handling the dipper and are able to leave the larger portion of the rock on the ground.

When a trip of coal cars is loaded it is hauled to Jeddo No. 7 breaker, where it is prepared for market. The distance from the point of loading to the breaker is about a mile and a half.

The wages paid to the men at Ebervale are considered fair and equitable for the anthracite region. Laborers receive $1.65 per day and up; lokie runners, $2.42; cranemen, $3.10, and firemen, $2.10. Foremen receive $100 per month, while shovel runners draw $140 a month.

In a good day's run, devoid of accidents, one steam shovel with a 2½-cu.yd. bucket will load 350 cars with rock and earth. As each car holds 4 cu.yd., this is equivalent to about 1400 cu.yd. of material handled. An accident, such as a derailment, causes a serious break in the organization and may greatly diminish the day's output. The men, however, become quite skillful in replacing cars on the track, and where great speed is required—as where a derailed car will hold up a trip—a lokie is frequently employed to facilitate replacing the car. For this purpose the front set of wheels is spragged and a chain or cable is made fast to the top of the car box upon which the locomotive pulls. This raises the rear set of wheels clear of the ground, when they may be swung to a position over the rails and lowered upon them by the lokie giving slack. The wheels on the track are then spragged, while the locomotive, by pushing on a pipe set against the upper portion of the car, lifts the front set of wheels, when they may be swung upon the track in a similar manner.

If the derailment occurs at or near the steam shovel, a chain attached to the car and hooked over a tooth of the dipper may readily lift a car, or one end of it, onto the track, when the other end may be similarly lifted into place. The locomotives are often employed also for pulling short sections of track into position. In short, the men at a strip pit soon learn to utilize the various machines to suit their convenience, and thus minimize the time lost through accidents.

The stripping at Ebervale was begun in 1913 with two 2½-cu.yd. steam shovels. There are now on this single operation 10 steam shovels—5 stripping, 4 loading coal

TEAM SHOVELS AND SEVEN LOCOMOTIVES ARE PLAINLY VISIBLE IN THIS PICTURE. TEN STEAM
MPLOYED AT THIS OPERATION

and 1 loading culm. There are also 35 locomotives, about 300 cars and something like 20 mi. of rail. The company operating at Ebervale has in all nine stripping operations under way in the vicinity of Hazleton, all of which except this one are worked on a yardage basis. These various operations require 28 steam shovels, 25 of which are Marion, with 3 Bucyrus machines; 100 locomotives, which were built by the Vulcan Iron Works, of Wilkes-Barre, and about 1,000 cars, which were built by the company in its own shop. These are all of 4-cu.yd. capacity and of 36-in. track age. The company maintains its own shop in Hazleton, where cars are built and repairs to practically all the equipment made. It also maintains its own engineering corps.

During the past 12 years the Central Pennsylvania Quarry, Stripping and Construction Co. has moved, including coal, approximately 72,000,000 cu.yd. of material, and has now under contract enough more work to bring its yardage to an amount exceeding that moved in the building of the Panama Canal.

The foregoing clearly shows the vast amount of equipment necessary successfully to prosecute stripping operations on a large scale. A few years ago it was considered that 4 cu.yd. of earth could be moved in order to secure 1 cu.yd. of anthracite. At present this ratio has increased to approximately 8 to 1.

The depreciation of equipment on a stripping operation is high, in some instances as much as 25 per cent. being allowed for depreciation and repairs.

The men who can shoulder and carry to a successful conclusion such an undertaking as has been described must possess certain personal qualities in superabundance. They must be either naturally or by training civil engineers, level-headed business men, good organizers, able executives, and finally they must be able to win and hold the confidence and loyalty of their subordinates and employees. From the financial standpoint, also, it requires nerve to start such an extensive undertaking where the exact nature of the rock overlying the coal measure is not and cannot be definitely known. A nest of boulders or an accumulation of hard conglomerate, either of which would require extensive blasting, might easily turn a contractor's profit into a considerable loss.

Of course the contract to remove the coal from the worked-out area at Ebervale was undertaken primarily that profit might accrue to the people who did the work. It should not be overlooked, however, that by this means coal is produced cheaply and safely, and practically all of the fuel in the coal-bearing measures is reclaimed, and none of the wealth with which Nature has so richly endowed this vicinity is wasted through imperfect and extravagant mining methods.

⁂

California Is a Producer of Coal as Well as Oil

Although California oil has to a large extent displaced the use of coal as a fuel in the Pacific Coast States, two California mines reported an output of coal in 1914. In order not to reveal the individual output of these mines their production is grouped with that of the one producing mine in each of the states of Idaho and Nevada, and the total combined production of the three states in 1914 is given at 13,974 tons, valued at $39,821, according to the Geological Survey.

Coal mining and the coal trade generally in California lay little claim to importance among the industries of the state, particularly since the beginning of the present century, when the production of petroleum began to exert so powerful an influence on the fuel consumption of the Pacific Coast. From 1910 to 1912 inclusive, the coal production of the state was only a little more than 10,000 tons in each year; in 1913 work was resumed on the Stone Canyon properties in Monterey County, and the production increased to 24,839 short tons, valued at $84,073. The output of 1914, however, showed an appreciable decrease. The only other production in 1914 was from the Ione mines, in Amador County.

Correct Tipple Design--II

By M. L. Hyde*

SYNOPSIS—The second and final article on this subject. The advantages of the jigging conveyor are here taken up and an imaginary and ideal tipple is described in detail.

In a well-designed tipple the picking tables for handling nut and slack should allow of bypassing their entire contents for a given period of time, direct to either bins or boiler-room conveyor. This necessity arises when a loader sends up an exceedingly dirty car of coal; for while the lump and egg can be hand-cleaned during the time allotted for their passage through the picking room, yet to get all the dirt from the nut by hand would hold up the tipple such a length of time as to more than offset the small value of the coal won; therefore no time should be lost in side-tracking this undesirable product.

Tables should also permit the bypassing of smaller grades to a transfer conveyor, which can in turn discharge to conveyors leading to such auxiliaries as the washing plant, rescreening plant, coke-oven supply bins, etc. Not only the small grades, but the lump as well, should be easily diverted in case locomotive coaling stations or storage bins are installed.

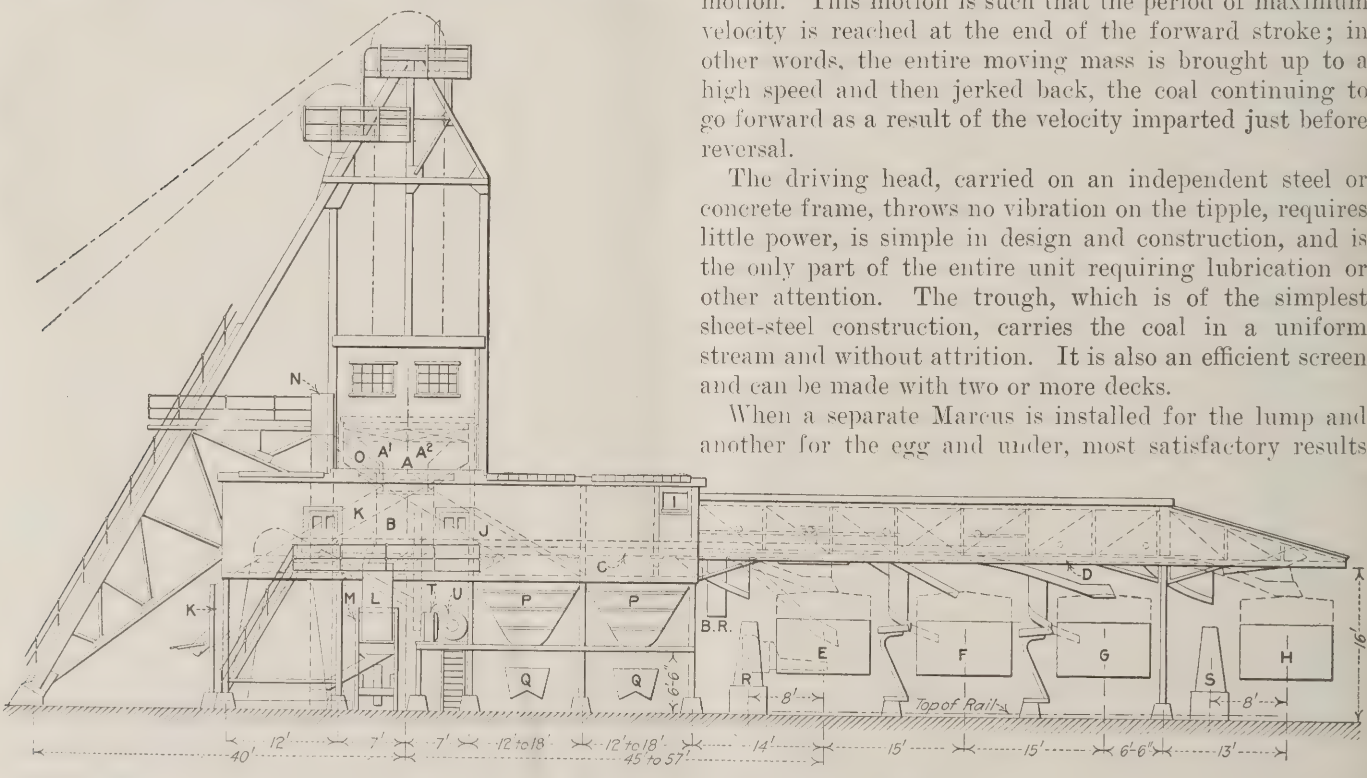

FIG. 3. A SIDE VIEW OF AN IDEAL TIPPLE

More elastic than the apron and less costly is the drag conveyor. If designed with bar scrapers of the same depth as the chain links—say 3 or 4 in.—it will carry coal in a uniform stream of whatever depth fed by the preliminary screens. As far as attrition to the coal is concerned, it is doubtful if the most careful check would disclose a loss to any grade. With very friable lump, dragged at 40 ft. per min. over a distance of 100 ft., the writer, after numerous tests, failed to observe any loss or any accumulation of fines.

The drag carries equally well on either strand, is light, easily installed, can discharge at any point in its entire length, and do it with a gentle forward pushing of its load. This is an utter impossibility with the apron, the discharge of which over the head sprockets is the roughest of any table on the market.

The drag requires the same lubrication from end to end as does the apron, and is rather high in power consumption. In every other way it is the better table.

Standing in a class indisputably alone is the horizontal shaking table, marketed under the trade name "Marcus" by the Roberts & Schaefer Co., Chicago.

The Marcus consists of a steel trough from 3 to 6 ft. wide with 10 in. high sides, the whole riding on a series of 9-in. floating rollers, which are held to their runways by springs leading from their axles to the trough and to the supporting structure. A self-contained driving head, belt-driven from a motor, gives the Marcus its jigging motion. This motion is such that the period of maximum velocity is reached at the end of the forward stroke; in other words, the entire moving mass is brought up to a high speed and then jerked back, the coal continuing to go forward as a result of the velocity imparted just before reversal.

The driving head, carried on an independent steel or concrete frame, throws no vibration on the tipple, requires little power, is simple in design and construction, and is the only part of the entire unit requiring lubrication or other attention. The trough, which is of the simplest sheet-steel construction, carries the coal in a uniform stream and without attrition. It is also an efficient screen and can be made with two or more decks.

When a separate Marcus is installed for the lump and another for the egg and under, most satisfactory results can be realized. The former allows of cleaning the lump, lip-screening it, and of loading with the utmost care either in open or box cars. With the lump car tracks located on the inside nearest the dump, this grade is given preference on the short travel.

The Marcus for the small grades should have two decks, permitting immediate removal of the slack to the bottom deck, where it travels to either cars or such bypass as may be desired. This leaves exposed, free from fines, for pick-

---

*Pembina Coal Operators, Ltd., Evansburgh, Alta., Canada.

ing, the egg and nut, which can be further lip-screened before going to the cars.

The troughs should be 5 or 6 ft. wide, and if 24 ft. clear picking length is provided, 6 or 8 boys can work at the table and handle 150 tons per hour easily. With a very dirty coal this length should be increased to 30 ft. and more boys employed.

The Marcus carries and thoroughly screens either wet or dry coal, is neither dirty nor dusty, allows the boys to stand close against its sides, with no danger of their being hurt, and has all the advantages of the drag in discharging. It should be set to clear the rails 16 ft. as against 21 ft. required for the apron.

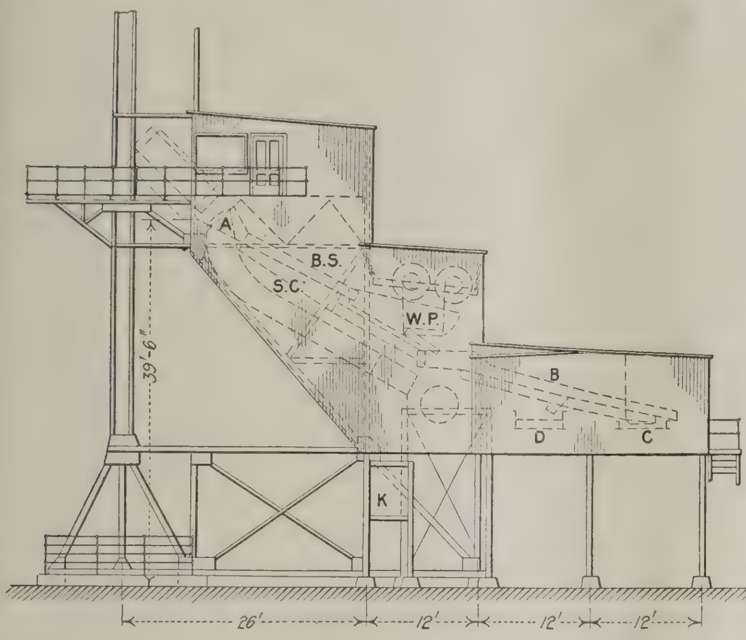

FIG. 5. END ELEVATION OF TIPPLE WITH BAR SCREENS

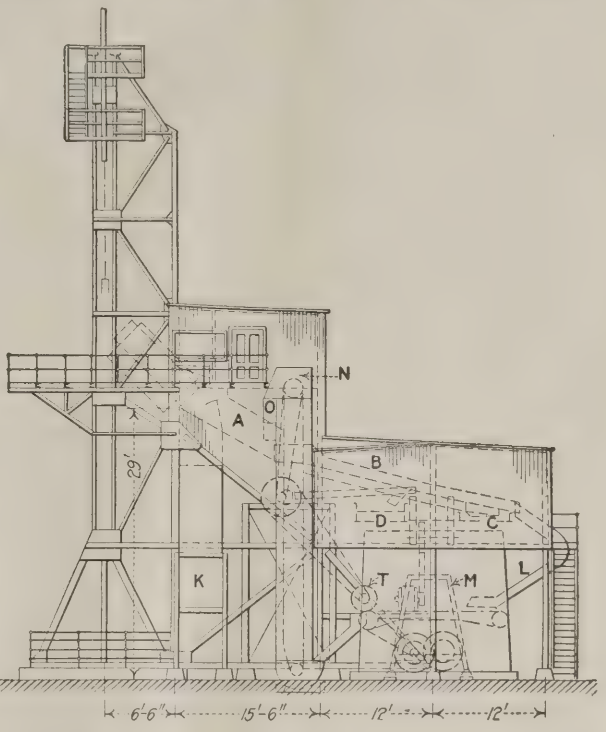

FIG. 4. END VIEW OF TIPPLE

In every way the Marcus fills a long-felt want on this continent, where for years we have spent our energies designing structure after structure, each more elaborate than the last, each with its complement of feeders, balanced screens, apron tables, hinged loading booms, revolving screens, etc. Each cost considerable money and all were ungainly and high in upkeep. With the advent of the Marcus necessity for them passed away.

In the loading chutes, because of the low clearance required for the Marcus over the railway tracks, material improvements can be introduced.

The hinged loading boom is today the most popular means of getting coal from the tipple to the car. On paper it is all the heart could desire. In actual practice it consists of one end of an apron conveyor carried between two trusses about 35 ft. long, hinged at one end to the floor of the tipple and suspended from an electric hoist at the discharge. Assisting the hoist are a series of counterweights and safety chains, for the weight of the loaded machine is enormous.

An operator lowers this boom to the bottom of an open car, starts the conveyor and slowly cones the coal up by raising the boom. It loads gently and uniformly. The average drop from boom end to coal is from 2 to 4 ft. Less than this will foul the boom on coal already discharged.

The first cost of this machine is excessive. It requires power drive, and where used for lump, should be used also for egg as well, since owing to the high elevation of the picking tables or screens discharging onto it (this elevation being required to allow the boom in raised position to clear the rails by 16 ft.) the chutes for carrying the egg to the cars would be unreasonably long and steep. It eliminates lip-screening, which is a most necessary adjunct of all lump chutes, for the rolling over of this grade during picking is sure to cause some fines, which must be removed before loading.

It eliminates also all chance of the satisfactory loading of box cars and of using box-car loaders. It requires an operator, is high in upkeep and is subject to serious damage if a car during the loading process should get away. To summarize, for the privilege of end-loading open cars, this complicated equipment is being installed at a cost many times the investment required for the Marcus, with its manifold advantages in every department.

The requisites of a loading chute should be ease in operation, simplicity, ability to cone the coal from top to bottom of any size or type of open car with a minimum breakage, ability to put coal through the doors of box cars without drop or jar between the picking-table discharge and that point. It should be easily hoisted to clear the rails by 16 ft. when not in use, and should be of a design permitting as little spillage as possible. Such a chute is shown in Fig. 9 and is later described.

Many operators are prejudiced in favor of end loading for open cars. Every advantage this system can show is fully covered in actual practice by the chute illustrated. This chute should be used for lump, egg and nut grades. Slack requires nothing more than a plain gravity type of chute without adjustment other than clearance when not in use.

All tipples should be equipped with box-car loaders for lump. This grade cannot be satisfactorily loaded by hand. When the mine's daily capacity exceeds 1000 tons, a loader should be furnished for the egg as well; if this is not done, three men will be required in a car loading any combinations with this grade as against one man with the loader.

The loaders recommended as being the gentlest in handling the coal, requiring the least power and being the easiest to operate and repair, are those made by the Manierre Engineering Co., of Milwaukee, Wis., and no operator should let his tipple contract without first personally assuring himself of the correctness of this statement. One type of loader can easily make from 1000 to 2000 lb. more slack in a car than another of better design; and the sales department well knows the trouble and dissatisfaction this may cause.

A Standard Tipple is Assumed

Fig. 3 shows a side elevation and Fig. 4 an end elevation of a tipple meeting all the demands imposed in the foregoing part of this paper.

This tipple has a capacity ranging from 750 to 3000 tons per day, no alterations being required except in the width of screen. Notice the clean roof lines, freedom from unsightly projections, common floor line, ease of getting at all sides of each machine and the complete lighting system. Compare the height of dump, 29 ft., with that of other so-called modern tipples. Regardless of the amount of rain or snow fall, the building is suitable and can be maintained in first-class condition at small expense.

While a shaft design is shown, the whole arrangement is applicable to drift or slope mines. The location of the dump hopper would be as shown, and the rotary dump or conveyor discharge arranged to suit.

The headframe is of the end-hoisting type which is preferable to the side hoist because of simplicity and small angle of fleet of hoisting ropes, allowing of a single-drum hoist. It has a landing stage at both the surface and the topman's office. Stairs to the upper landing and to this office are carried up the engine brace. All entrances are carefully protected with iron fences 6 ft. high.

Cages of the Wellman-Seaver-Morgan Engineering Co.'s make, or their equal, are recommended. Such cages are substantial in design, safe, and gentle in their discharge. The car, on being thrown forward in the dumping position, has its end door caught and lifted clear of the coal, which flows forward to the hopper *A*, during which time the topman removes the loader's check.

Passing over *A*, the coal flows to the screen *B*, where it strikes a level section 3 ft. long, acting as a feeder to the egg perforations immediately following, and at which point the egg, nut and slack are separated from the lump, falling to a lower deck, which in turn discharges to the Marcus picking and screening table *D*. The lump passing the egg perforations goes next over the cobble perforations, the undersize passing through to the table *C* and the oversize to chute *L*. By unbolting the cobble screen all lump passes direct to *C*.

Screen *B* is belt-driven by a motor set in the motor house under the main floor. This houses all motors by themselves, which places the responsibility for their upkeep in the hands of one man, as no one else can get at them. Though not shown, this house should have dust-proof sides and roof and approach stairs from the ground.

On the Marcus table *C* the lump coal is picked, lip-screened, and discharged to open cars on track *E* or to box cars by means of the Manierre loader *R*. Care should be taken in the design of a tipple to avoid having to send all lip-screenings to slack cars; for if this is the only method of disposing of them, each time a slack car is changed the whole tipple will have to stop, as the loading of lump cannot go on.

On Marcus *D* the egg, nut and slack jigging forward pass immediately over a slack screen, leaving the two larger grades unobstructed and in perfect condition for picking. The slack falling through moves forward on a lower deck. At the end of the picking surface the egg and nut again pass over a lip screen, sending all chippings resulting from picking through to the slack. The egg rides forward to open or box cars on the track *H* or to the box-car loader *S*. The nut is separated from the egg just before reaching the chutes at track *G* and falls to a lower deck, thence to cars on this track, the slack having already left the lower deck at track *F*. By means of valves closing the discharge to chutes over the tracks, the nut and slack can go forward, allowing of the following combinations: Track H—Egg; egg and nut; egg, nut and slack. Track G—Nut; nut and slack.

From Marcus *D* slack, or nut and slack, can be bypassed to the boiler-room conveyor at chute *B R* or dropped direct to the bins *P*. Where nut and slack are diverted to either of these channels the slack screen on this table should be replaced with a nut screen, as it would be unnecessary to pick the nut in that case.

As few obstructions in the way of columns as possible should be allowed between the tracks, the tables and chutes are therefore carried by trusses over tracks *E F* and *G*. Elevated walkways, not shown in the drawing, should be placed between the cars at a height of 6 ft. to facilitate movements of car loaders.

The pivoted box-car chutes, falling through car doors in forward position, are carried on concrete blocks. On each of these at *F* and *G* and on the foundations of loaders at *R* and *S* should be mounted car retarders of the Fairmount Mining Machinery Co.'s design to allow of shifting open cars during loading. These are inexpensive and of decided advantage on every track.

The cover over all tracks is 24 ft. long and forms an ample rain shed for loading cars.

On lump track *E* the following combinations can be made: Lump; lump and egg (accomplished by changing the egg perforations on preliminary screen *B* to nut perforations, sending the lump and egg both to Marcus *C*); lump, egg and nut (accomplished by a plow on Marcus *D*, which discharges the egg and nut to the transfer conveyor *I*, in turn feeding Marcus *C*); lump, egg, nut and slack (same process).

All Motors Are Duplicates

The two Marcus tables are driven by a duplicate of the motor employed to drive the screen *B* placed in the same room with the other motor. Both the tables *C* and *D* and screen *B* are controlled from the picking room, so that all machinery can be stopped for very dirty coal, changing of cars or accidents.

Waste from the tables is dropped through spouts to the bins *P*, placed directly under the picking-room floor. From these it is discharged through roller-bearing slide gates to cable cars Q of the hinged side-door type. These cars are hoisted to the waste pile by means of a two-drum electric hoist set next to the box-car loader *R* and handled by its operator during lulls. The cars are dumped on the pile automatically, the entire outfit being furnished by the R. W. Hunt Co. or the John A. Mead Co.

One drum of the hoist is used for cars *Q* and one is so led that it can be used for handling railway cars about the tipple. During cold weather trouble is often experienced moving cars, and at all seasons the yardmen are apt to drop a car too far below the tipple and it must be brought back. This is a hard job with an old stiff car, but all this work is accomplished by the extra drum.

The waste bins *P* should be of the Berquist suspension type, self-emptying, easily repainted and repaired. The cars *Q* and the track upon which they run should be installed as soon as the tipple stakes have been driven, after which all yardage from shaft sinking, foundations, ditching and ground leveling can be sent to the waste pile, which will be used for all time. If this is done, the plant site will not be littered by waste piles occurring here and there merely because the designer failed to consider this question in the first place. In fact temporary extensions to this track can handle all dirt from the rest of the plant units and townsite excavations. Three all-steel cars should be furnished complete with hoist and ropes, as well as trackage.

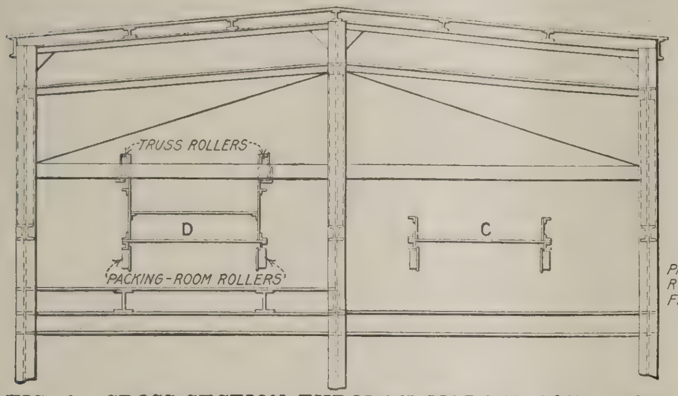

FIG. 6. CROSS-SECTION THROUGH MARCUS CONVEYORS

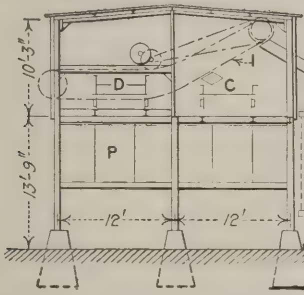

FIG. 7. SECTION THROUGH PICKING ROOM

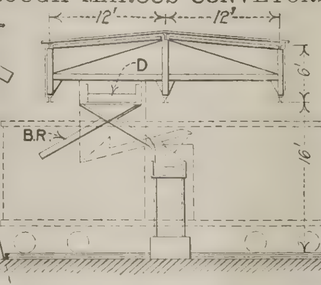

FIG. 8. LOADING CHUTES FOR SLACK AND NUT

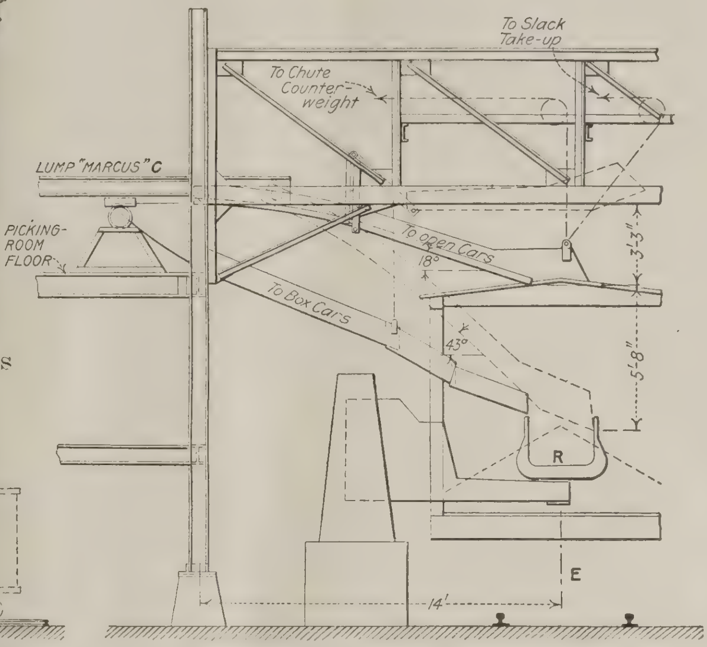

FIG. 9. ARRANGEMENT OF CHUTES AND BOX-CAR LOADER

Lump for cracking passes over the Marcus *C* to the chute *L*, thence to the cracker *M*. The Whitaker coal breaker, manufactured by the Hardy Patent Pick Co., of Sheffield, England, is shown herewith and is the most suitable known to the writer.

Briefly, the breaker consists of a series of mechanically worked picks acting on the coal traveling on a short steel belt conveyor, the action being precisely that of hand breaking with mechanical regularity. The unit is driven by a 10-hp. motor and has a capacity of 200 tons per hour.

From the breaker *M* the cracked lump flows to the boot of the elevator *N*, which in turn discharges through the chute *O* to the head of the screen *B*. This elevator should consist of steel buckets 30 in. long, carried on two strands of steel-thimble roller chain, and should be wholly incased in a housing of $\frac{3}{16}$-in. steel. This elevator is driven through a chain from the eccentric shaft of screen *B*. Local coal is obtained by opening the valve *A'* in the receiving hopper *A*, and thence by means of a deflecting valve operated by the topman sent to the local coal bin *K*, so set that its wagon feed valve is well away from the tipple. By throwing the deflecting valve previously mentioned rock can be spouted by chute *J* to the inside waste bin *P*, extended and roofed to care for this storage. The transfer conveyor *I* not only feeds table *C* but by means of it any of the small sizes may be sent to any of the auxiliary units desired.

The loading chute illustrated in Fig. 9 is of ¼ in. steel and is made up of two sections fastened together by a sword hinge. This hinge is bolted shut with wing-nut bolts as long as the chute is used for open cars. When box cars are loaded the hinge is unbolted and the lower section of the chute pulled up to the clearance line as shown. The rear end of the chute is supported by rollers.

In addition to the features already considered, arrangements should be such that prior to a shutdown coal can be sent to an auxiliary outside storage in sufficient quantities to care for the boilers and meet local demand during that time. This can best be done by deflecting coal over the rock chute to the waste bin *P*, thence by car *Q* to a pile separate from the main waste storage.

From the industrial waste tracks for cars *Q* a spur should be led at right angles to all railroad tracks and across them, so that car *Q* may be pushed over and loaded with spillage and other dirt between or on the tracks.

The following enameled signs should also be part of the tipple equipment: Instructions for signaling cages at every landing, "no smoking" signs at the foot of each stairway, blackboard at main landing for temporary notices. A check board for mine-car checks and an employees' register board should both be placed at the topman's office if upper landing is used; if the lower landing is employed, the register board should be at the lamp room.

Analysis of the Coal-Car Situation

Compiled by A. T. Shurick

SYNOPSIS—Conforming with its usual custom at this period of the year, "Coal Age" presents herewith official comments from the leading coal roads as to the outlook for the coal-car supply during the coming fall and winter. The carriers are generally confident of their ability to handle the business as regards their respective lines, though it seems probable that for a period there will be a shortage in equipment.

American Railway Association

By Arthur Hale, General Agent

The surplus of coal and gondola cars reported by the American Railway Association for Sept. 1, 1915, was nearly 41,000. This is not far from last year's figure for the same date, which was 46,000, but the shortage of coal cars this year is over 2,300, while last year it was only 66. There was no large surplus of coal and gondola cars prior to 1914 until we get to 1909. There we find on Aug. 18 a surplus of about 42,000. In 1908 the surpluses were much larger until the middle of October. It is of course difficult to judge from these figures what the situation in coal cars will be in October and November, but in 1909 there was quite a marked shortage, which ran up to nearly 12,000 cars in the middle of November.

There is one point in which the record this year is similar to that of 1909; that is, the surplus decreased very rapidly in August, while in 1914 it came down very slowly. This would seem to point to the possibility of some little coal car shortage in the months of October and November of this year.

On the other hand, the drop this year seems to be about two weeks later than it was in 1909. Here again it is difficult to compare, because this year we have figures only for the first of the months, while in 1909 we had them for the middle of the months as well.

If we can judge this year's showing by that of 1909, there will be a shortage of perhaps 8,000 or 10,000 coal cars on Nov. 1, 1915.

Chesapeake & Ohio Ry. Co.

By E. W. Grice, Assistant to President

This company is making an extraordinary effort to get its freight-car equipment in good condition for the fall and winter business, and expects to have its bad order list as low as practicable in numbers. This is also true of the locomotive equipment. Twenty-four Mallet locomotives have been purchased and are now coming on the road, and will be available for the autumn business. Several thousand box and coal cars are being rebuilt at outside shops, and we apprehend no difficulty in providing equipment for the business that will be offered. Additional yard and side-track facilities are also being provided. The new coal pier is working admirably, and is handling the business satisfactorily.

Western Maryland Ry.

By S. Ennes, General Manager

We have contracted with the Lima Locomotive Works for 15 of the largest Mallet engines ever turned out for road service, which we feel will give us power to handle promptly a large increase in tonnage. Our car supply has been good for the last 18 months, but in anticipation of increased business we have plans about ready for a 70-ton coal car and expect to ask for bids in the near future. Our track conditions are good, and we are making additions and improvements in our yards, so that I feel safe in assuring you as a representative of the coal industry, that we will be able to take care of our patrons in good shape.

Virginian Ry.

By S. M. Adsit, General Freight and Passenger Agent

There is nothing of special importance to report in regard to the car supply on the Virginian Ry. For the past 12 months the supply has been more than adequate and it will require a greatly increased tonnage to change this condition adversely.

Louisville & Nashville R.R.

By G. E. Evans, Fourth Vice-President

As conditions relating to the coal-car supply upon our lines are very much affected by the general situation throughout the country, because the coal markets are to a large extent beyond our rails, we hesitate to express an opinion.

Hocking Valley Ry.

By M. J. Caples, Vice-President

There is no question but that the Hocking Valley will be able to provide a full car supply for all the mines on its line during the coming year. At the present time (Sept. 7) we have 3,500 coal cars stored on the line because there is not sufficient business to make use of them. At times during the current year this surplus of cars has been as high as 8,000, and it would be still greater but for the fact that we have sent these cars to other roads for loading.

Toledo & Ohio Central Ry. and Kanawha & Michigan Ry

By F. B. Sheldon, Vice-President

We are not anticipating any shortage of equipment. Since the publication of your analysis of the coal-car situation one year ago the Toledo & Ohio Central Ry. has added seven heavy consolidation freight locomotives to its motive power and 2,500 steel coal cars of 50 tons capacity. This means an increase of 40 per cent. in the capacity of its coal-car equipment, which now amounts to 8,500 cars.

The Kanawha & Michigan Ry. has 6,000 coal cars. On Oct. 1, 1914, the Toledo & Ohio Central Ry. became the owner of the Kanawha & Michigan Ry. by the acquisition of practically all of its capital stock. Owing to the extreme depression of the coal industry the two lines have had for nearly a year past a very large surplus of idle coal cars, and with the revival of business, which has already set in, there is no likelihood of any shortage on our lines.

Our motive power is in good condition and ready to handle without delay all traffic that may be offered to us at any time.

New York Central Lines

By F. E. Herriman, Coal Traffic Manager

The New York Central Lines are hopeful that there will be no difficulty in taking complete and proper care of the fuel traffic this fall and winter. As to motive power, increased yard facilities, etc., it is our belief that everything possible has been or is being done to maintain, and perhaps increase, the capacity of the system for handling coal tonnage.

By A. T. Hardin, Vice-President

The present returns appear to indicate some improvement in the situation. However, this company has a surplus of 13,000 cars in excess of present (Sept. 3) demands, and hopes to be able to meet all demand for increased traffic.

Buffalo, Rochester & Pittsburgh Ry.

By E. A. Niel, Coal Freight Agent

The policy of our company has been to maintain the the car supply on such a basis as to fully meet the requirements of our coal shippers, and we have generally provided for such equipment a little in advance of their actual demands; that is to say, we have anticipated the needs of our coal shippers and made the necessary arrangements for additional coal-car equipment, with a view of at all times furnishing 100 per cent. of the cars needed at the mines along our line. For several years past we have had no car shortages.

We have increased our motive power by the purchase of a large number of the heavier locomotives of modern type, thus preventing delays in shipments and thereby increasing the efficiency of the cars themselves. In addition to improvements in rolling stock and motive power, we are continually improving and strengthening our roadbed and eliminating curvature wherever economies can be effected, so that at the present time we are better prepared than ever before to handle increased coal tonnage in the most satisfactory manner.

The indications point to a materially increased demand for coal and a corresponding demand for cars, which will doubtless tax the ability of all lines in this section.

Delaware & Hudson Co.

By C. S. Sims, Second Vice-President and General Manager

During the past year this company, in conjunction with the Pennsylvania R.R., has finished the construction of the Wilkes-Barre Connecting R.R., uniting the rails of the Delaware & Hudson with those of the Pennsylvania through the city of Wilkes-Barre. This does away with the congestion and delay formerly encountered in passing through the city limits and adds enormously to the traffic possibilities, probably bringing about a decrease in the average time requirement of at least half a day. We are also building just south of Carbondale a modern plant for the storage of anthracite coal.

Central R.R. Co. of New Jersey

By W. G. Besler, President and General Manager

So far as the Central R.R. of New Jersey is concerned, there is nothing of unusual interest to report. We have kept our property and rolling equipment right up to their usual high standard. We have worked our shops full time and augmented the forces by several hundred men, so as to have our equipment in an A1 condition to provide for a possible increase in business. We expect for the future, as we have in the past, to be able to take care of all of our patrons.

Philadelphia & Reading Ry.

By A. T. Dice, Vice-President and General Manager

I can only say that the experience of this company has been for a number of years past that we have always been able to provide a full supply of coal cars for shippers on our line, and I see no reason why we shall not be able to do the same during the coming winter.

Delaware, Lackawanna & Western R.R.

By E. E. Loomis, Vice-President

We hope and expect to fill all demands for cars to load with coal on our line during the coming year.

Extracts from a Superintendent's Diary

I received a letter from the general manager of our company today in which he requested me to give his oldest son a position at our camp in any capacity that I might decide would be best for the young man. He is 23 and has just graduated from the Columbia School of Mines in mining engineering.

At first I felt very much puffed up by the compliment, for such it surely was, because the general manager had the pick of twelve superintendents. Just why he should have chosen me I of course could not tell, but the fact that he is willing to have the boy lay the foundation for his career under my guidance is pleasing to say the least.

After looking at the matter from all angles, however, I am sorry that I cannot thank the general manager for the compliment and then pass the responsibility on to one of the other superintendents.

It goes without saying that the general manager does not expect his son to remain in one position long; he wouldn't be a normal general manager if he did. What he desires is that the boy be given a chance to familiarize himself with everything in connection with the operation of a coal mine, as no doubt he intends to put the son in charge of an operation as soon as he acquires the necessary confidence and experience. All of which is very desirable and possible from his standpoint, but very difficult from mine.

Assuming that the boy is all that he ought to be (which he probably is not) and that he will be very anxious to make the most of his opportunities (which he also probably will not), there is still the possibility of engendering much hard feeling all along the route that he will travel. It is so natural for men who have had to hold on to minor positions longer than they consider necessary (and most men in minor positions come in that classification) to assume that advancement can only be obtained through a "pull" that, if they have an opportunity of seeing this favored son pass merrily along from bottom to top without noticeable effort, they will be more than apt to become discouraged if not embittered.

In the one case the rapid rise to power furnishes an example that thrills all who have been thrown in contact with the fortunate one, and here and there some discouraged struggler even takes a new grip on life; but the rise of the manager's son would have no such bracing effect.

I am unable to get enthused over the fact that I may have the opportunity to assist in this matter. Possibly the realization of the fact that some day he will outrank every one in our camp, myself included, may have something to do with my feelings in the matter, but I wouldn't admit in public that any such ulterior ends could sway me.

The Labor Situation

SYNOPSIS—The tradespeople in the anthracite region are anxious to remove the menace of a strike and want a speedy convening of operators and miners. The right of miners to unionize outside the U. M. W. of A. is being tested in West Virginia. Attorneys for the miners in Colorado are charged with subornation of perjury. J. D. Rockefeller, Jr., visits his Colorado miners.

The tridistrict convention has met and adjourned. The demands of the miners though intended to be fair are nevertheless unreasonable. The papers of the anthracite region assure us that they are no more extravagant than has been customary, and so perhaps it would be safe to assume that the usual trade discount can be applied to them and that the miners will not adhere rigidly to their circular.

It will behoove the operators to go carefully over the ground and make up their minds as to the rights of the situation and declare what these are. If the cost of living has advanced, the miners are entitled to an increased wage, and this is still true even if it be proved that some of the operating companies are not able to make fair returns under the present scale. The public can, must and should pay this increase, and the operators should give the consumers a clear understanding of what new price must be established to restore the status quo.

A Public Which Does Not Know Cannot Be Censured

The people should not be asked to pay any more than will indemnify the companies for the increased cost of production resulting from a larger wage and workmen's compensation. The consumer does not know just why the larger wage must be principally placed on the domestic sizes, especially if the bituminous operators do not concede an equal rise in wages. He does not know that because he demands the cream of the coal he must shoulder the bulk of the burden. He does not understand these things because he has never been told. Only a "divine right" utterance has been given him upon which he has placed a somewhat unfair interpretation. He is accordingly not to blame, because a lack of knowledge of facts is not like an ignorance of the law. It excuses the newspapers in publishing and the public in accepting a large amount of misinformation.

A careful and accurate statement should be prepared, quite unlike one which has just been received, which, by the way, was not issued by the anthracite operators. It says, speaking about the Scranton wage demands: "The employee intends to take the position of dictator, while the employer will be expected to take a humble seat." This plaint will not appeal to the democracy. The successful advocate of the operators' rights must make no reference to the question as to who is running the mines—the operators or the men they employ.

The statement which will convince will show that profits are necessary, that the old scale was declared by a commission to be reasonable, that the changes are or are not justified by an increase in the cost of living and that advances in price are warranted by increases in cost. The public is not disposed to believe that property has any rights to profit and increment except through service and does not care who is in the saddle so long as the ends of good government are sustained. The mine operator is performing a service; his profits, if in reason, promote the public good. He is, in seeking his self-interest, striving after economical production which serves equally the public advantage. The dictator and the servant are one, and neither party has a right to say, "We demand," as do the miners, without fortifying his position with argument. Once deny the duties of the operator and you surrender your right to hector the working man for his lapses in civic virtue and common sense.

Wilkes-Barre Dreads a Delay in the Wage Decision

The trades people in the anthracite region, especially in Wilkes-Barre, are rebelling against the delay in negotiations. They feel that the convention at Scranton, the canvass for membership and the tridistrict meeting in Wilkes-Barre have created such a strong feeling of apprehension that business is sure to suffer. The miners also will hoard in anticipation of a strike and all trade, based on their needs, will be bad.

The Chamber of Commerce in Wilkes-Barre wants the miners and operators to meet before the Indianapolis convention has commenced its sessions, not after. This meeting begins on Jan. 17 and will probably remain in session until Feb. 5. For some time after that the merchants will be in suspense, and if a settlement is not secured in seven weeks the strike may be called.

The business men fear they may experience five lean months followed by several weeks of actual idleness. The enforced economies, however, if not followed by a strike will be of great advantage to everyone. There is a strong tendency for the wage earner to live up to the last cent of his income, and just before a strike the workingman learns what it means to receive money and put it by for a rainy day.

Mr. White hopes that he will have 123,000 men in the union when he meets the operators. Last month there was a paid-up membership of 63,108; but in addition it is said that there were enough members who were exonerated from paying dues from lack of work to bring the number up to 100,000.

Another Injunction Is Brought by a Mine Worker

Thomas Holton, of Local 996, has begun an action in equity against Peter O'Donnell, enjoining him from acting as a member of the executive board of District No. 1 of the United Mine Workers of America. O'Donnell received 6,937 votes and Holton only 5,842, but Holton claims 6,903 and declares that O'Donnell should have only 5,031. The matter was well aired at the convention of District No. 1, and Holton's contentions are given in some detail in "Coal Age" of July 31, p. 175.

John Dempsey and John M. Mack, president and secretary respectively of District No. 1, and Richard Roberts, Martin Battle and Casimir Shemanski, the tellers, are made codefendents with Peter O'Donnell. This is the third injunction by mine workers in the last few weeks. It is evident that the union men are seeking to use the court of equity as generously as the operators. Now that they are using it they may find less popular opposition to the injunction. It may be predicted that when they have employed it for a while new virtues in its application will forthwith appear.

Ohio Is Trying to Find a Place in the Sun

The Sunday Creek Co. is furnishing the miners of the Hocking district with a statement of the position of the operators on the wage scale signed more than a year ago. The company has sent out thousands of copies of the wage agreement without any comment. But the sections which are supposed to have been violated by the subsequent action of the officials in signing up eastern Ohio are printed in italics. The company hopes that by going over the heads of the officials of the miners' organization it will get the issue fairly before its men. It is expected that other literature will be sent out later.

As was to be expected, the operators in West Virginia have shown much concern about the proposed increased freight rates in that state and they intend to oppose the application of the Interstate Commerce Commission when it is made. The Kanawha Coal Shippers' Association, the Splint and Gas Coal Association of West Virginia and the Central West Virginia Coal Operators' Association have all meet to discuss the change. At the meeting of the latter, which was at Fairmont, W. Va., 95 per cent. of the productive capacity of the Fairmont-Clarksburg district was represented.

There seems to be a fear that rates will not only be raised in West Virginia but also lowered in Ohio. The operators wonder that coal-freight roads which have done so well on the rates established should ruin, as they express it, both the state and themselves by raising freight rates.

The West Virginia people have shown little concern about their progressive ruination of other states and they cannot expect Ohio to show the virtues of consideration. It is true that a readjustment which would permanently injure West Virginia and make its production go backward would be inadvisable if not unjust. But it is much to be doubted if 15c. per ton would have so large an effect, for the state has had unquestionable advantages over its neighbors as shown by the progress in output and the number of new operations.

Disputes Still Unsettled in Eastern Ohio

The miners and operators in the eastern Ohio district formed some time ago a joint committee, composed of Fred Ledvinka (representing C. J. Albasin), William Roy and Frank Woody for the miners and J. R. Roby, W. Osborne and Franklin Neff for the operators. They have been discussing the removing of rock, "pick-outs," the setting of timber and the cutting of room necks by machine men. They held a two-day session and on Sept. 15 adjourned without agreement.

An arbitration committee will be formed, with C. J. Albasin of Bridgeport representing the miners, the commissioner of the Pittsburgh Vein Operators' Association representing the employers and Thomas Wangler of Columbus, Ohio, as a third and neutral party. No commissioner has as yet been appointed by the P. V. O. A. in place of John Zalenka, recently deceased.

Boomer Coal and Coke Co. Forbidden to Pay Checkoff

On Sept. 13 about 1,000 miners employed by the Boomer Coal and Coke Co., at Boomer, W. Va., went on strike in order to bring pressure on the company not to yield to the officers of District No. 17 of the United Mine Workers of America. They feared the company would pay the checkoff to these men instead of giving the money they had collected to the officials whom the miners preferred.

West Virginia is in District No. 17, but recently a new division has been created by seceding unionists, which they term District No. 30. The company was about to pay the union dues to the officials of this newly erected district when the union asked for an injunction. The men who struck on Sept. 13 returned to work, the company urging that the issue was not theirs but the court's. The seceders have been fighting practically for the right of labor to sail under any flag it pleases, and the union has been endeavoring to compel the miners to remain within the fold whether they like it or not.

On Sept. 14 Judge H. D. Rummell refused to dissolve the injunction restraining the Boomer Coal and Coke Co. from paying money to the officials of District No. 30. So it appears that the corporation will hold the money in escrow for a further period.

Union Seeks Injunction Against Unionizing and Striking

It was also interesting to notice that the union asked for a rule against officials and others connected with District No. 30, charging them with endeavoring to cause a strike of miners working for the Boomer Coal and Coke Co. and bringing about a practical shutdown. But so far this petition has not been acted on. The rule would be as drastic as the most obnoxious of those granted in the past to operators against the unionizing of employees.

It is much more severe than the rule made by Judge Alston G. Dayton, which has been denounced from coast to coast and which is still creating trouble, though dating back to 1913. The miners have tried to have Judge Dayton removed for granting this injunction. Attorney Frank O'Brien, as special commissioner for Judge Dayton, is hearing evidence in the case of the West Virginia-Pittsburgh Coal Co. against Van Bittner, the president of the union in the Pittsburgh district, and others.

When the strike occurred in 1913 Fannie Sellers, James Oates and others were arrested and imprisoned on charges of using violence in forcing the miners to leave their work. The supreme court of Richmond overruled the decision of Judge Dayton, and the company is now asking for a permanent injunction to restrain the organization of the Brooke County field. The defense is endeavoring to show that there was no violence in the coercion used and pleads that an injunction is not needed, as there is now no intention to attempt any coercion.

The officials of District No. 14 seem to be making an attempt to secure a rule in central West Virginia which they openly declare the height of inequity in the Panhandle of the same state. It is to be observed that there is no coercion at Boomer. The men want to go into the new union, want to pay the checkoff to it and want to strike without hindrance from the old organization; and the union denies the miners the liberty, arguing probably that it has a contract with the operators making provision for its recognition, providing for the checkoff and forbidding strikes. But never so long as the union was undivided did it ever seek to restrain its men from striking by a resort to the injunction. Now it claims it has contracts which a strike will make it impossible to fill and pleads that the miners it is seeking to restrain will ruin its standing if allowed to conspire. The argument of the early operators is now being urged by the union as a reason for enjoining the miners who wish to form a rival body of their own.

Kansas, Indiana and Colorado Notes

The miners of the Sheridan Coal Co. in Kansas have won their strike and have returned to work. The right of workmen under the contract to be supplied with places at one mine when the mine of an affiliated company has been closed down was established. About 1,000 men were involved in the strike.

At the mine of the Deep Fourth Vein Coal Co., just west of Terre Haute, two blacksmiths were discharged. After five days of arbitration, all the employees went on strike. Horace N. Hawkins, general counsel for the United Mine Workers of America, and Fred W. Clark, local counsel, have been charged with subornation of perjury, the information being filed by Attorney-General Fred Farrar. Grover Hall, a juror in the murder trial of John R. Lawson, made an affidavit that he stood out for an acquittal of Lawson, but finally agreed to a verdict of guilty as a result of coercive measures employed by Frank Gooden, a court bailiff. In that affidavit he stated that Gooden had told him that his (Hall's) wife was seriously ill. He also swore that Gooden later informed him that Judge Granby Hillyer had ordered the jurors locked up without food till they were ready to agree to a verdict.

This affidavit was used by Hawkins and Clark when applying for a new trial for Lawson and also in connection with a petition whereby a supersedeas was secured from the Supreme Court. Hall has made another affidavit, stating that he was bribed to make his previous statement.

As was anticipated in last week's "Coal Age," R. W. Coates, a detective employed by the United Mine Workers of America, was arrested on a body attachment issued by the military court of inquiry investigating charges against National Guard officials. His attorney, C. E. Friend, started on a motorcycle to the West Side court in Denver for a writ of habeas corpus.

John D. Rockefeller, Jr., Visits Mines in Colorado

John D. Rockefeller, Jr., is making an inspection of the coal mines in Colorado in accordance with his promise to Mother Jones on the occasion of the sitting of the Industrial Relations Commission in New York City, Jan. 27. He made his appearance quite unexpectedly Sept. 20. He will spend at least two weeks in the state and make a thorough investigation of working conditons.

There has been some talk that the officials of the United Mine Workers will take advantage of Rockefeller's visit to arrest him for his alleged responsibility for the Ludlow battle, and that President J. F. Welborn of the Colorado Fuel and Iron Co., President David W. Brown of the Rocky Mountain Fuel Co. and President John C. Osgood of the Victor-American Fuel Co. would also be placed under arrest.

In fact it was stated by President John McLennan of the Colorado district that A. M. Belcher, chief counsel of the United Mine Workers of America, would arrive in Colorado Sept. 21, having such arrests as the main purpose of his visit. The miners, according to William Diamond, purposed to lay the information before Attorney-General Farrar not later than Sept. 22. If this failed the public was to be informed as to the evidence submitted, so that it could judge of the justice of the miners in demanding that action be taken. However, at present writing none of the actions threatened have been put in operation.

John D. Rockefeller, Jr., on Sept. 20 visited the scene of the Ludlow battle and the villages Berwind and Tabasco. He talked with the miners and interviewed their wives about working and living conditions. He also made suggestions for improvements.

At noon he lunched at the miners' boarding house with Tom Davis, the superintendent of the mine, who was clad in his blue overalls. In the afternoon he visited the Tabasco school and the improvement work done to employ idle miners. A steep hillside had been graded to make a playground. Mr. Rockefeller addressed the scholars and later visited more houses and had a long talk with Dan Morelli, a coal digger who has been elected to represent the miners of Berwind in conferences with the officials of the fuel company.

On the following day Mr. Rockefeller visited Segundo and Frederick and the "stone-wall" road recently erected with Rockefeller Foundation funds. In the afternoon he went in the mines and dug some coal, meeting Archie Dennison, the head of the grievance committee of the Frederick mine at Valdez. Dennison assured the visitor that the meetings of the committee with the higher officials had removed many causes of complaint with minor officers of the company. On Sept. 22, the Sopris School was visited, where one of the children gave Rockefeller a course in banking and finance.

There is a rumor that James J. Hill is about to purchase the Rockefeller holdings in the Colorado Fuel and Iron Co. The visit of Mr. Rockefeller to the mine and the denial of the New York office seem to discredit this report effectually.

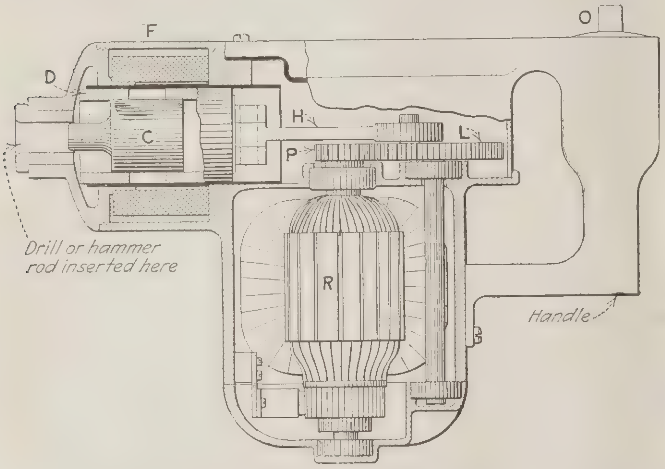
About 3,500 miners from two collieries in the Cardiff district, South Wales, recently went on strike because nonunion men were being employed in the mines. They took this action despite the fact that the nation was suffering for lack of coal and had declared an embargo on all foreign shipments, not allowing coal to be shipped even to allies. Their action is so reprehensible that the strike is not likely to spread.

New Apparatus and Equipment

New Electric Hammer Drill

The Western Electric Co. has recently placed on the market a line of electric hammer drills that may be operated at small cost from any convenient light-socket. A man equipped with one of these drills may be expected to do six times as much work as could be done by hand, while in some classes of work even greater speed can be attained. A man with a hammer or small sledge strikes from 50 to 80 blows per minute, while the electric drill strikes from 1,400 to 4,000.

The principle upon which this hammer works is as simple as it is effective. The main parts of the machine are the motor, a drill or hammer, and the magnetic clutch plunger. The motor *R* in the accompanying drawing transmits motion through the hardened gears *P* and *L*, and the connecting-rod *H*, to the cylindrical sleeve *D*, which has two relatively thick end sections with a thin center section connecting them. This center section is as thin as is consistent with mechanical strength.



CROSS-SECTION OF THE DRILL SHOWING THE ARRANGEMENT OF PARTS

The plunger *C*, which delivers the blow to the drill, lies loosely within this cylinder and is not mechanically connected to it or to any other part of the mechanism. Outside of the sleeve is placed the magnet coil *F*. This coil is stationary, the sleeve moving backward and forward within it. The coil is in series with the motor, and the current traversing it is always steady and in the same direction.

As soon as the circuit is switched on (by the button *O* conveniently arranged on the handle) a magnetic circuit is created with the thick sections of the sleeve as the poles and the plunger as the armature. As the sleeve is oscillated back and forth by the motor, the effect is that of moving the polepieces of the magnet back and forth, and the plunger clutched across the poles moves similarly, transferring its energy to the drill when the two parts come in contact, which takes place near the end of the stroke. The plunger is slightly longer than the thin section of the sleeve, which gives it a certain amount of overtravel and an elasticity of connection that entirely remove the stress and jar of the blow from the machine.

The motor is series-wound and the gears are of oil-hardened special gear steel, while ball bearings are employed throughout.

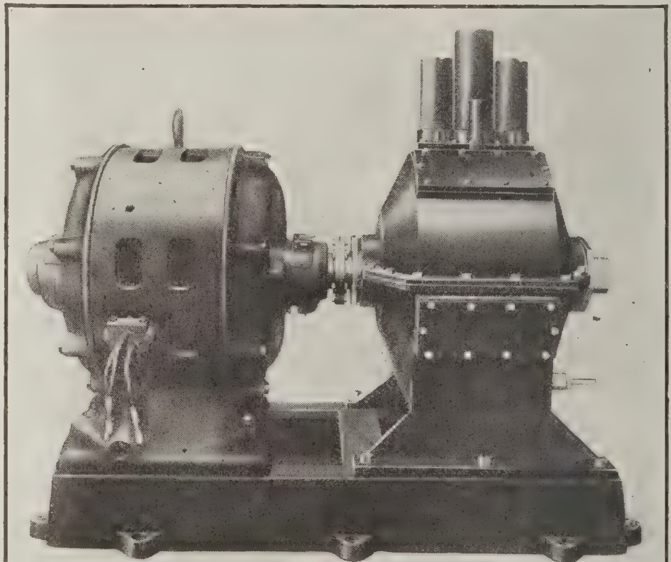
A number of these drills have for some time been in successful use in coal mines, where they have been employed not only for taking down top and lifting bottom, but also for drilling the coal face preparatory to shooting.

⁂

Jackson Rotary Air Compressor

A new type of rotary compressor, the invention of H. O. Jackson, is being perfected by the Jackson Compressor Co., 1130 Twelfth St., Denver, Colo. As yet the machine has been built only in relatively small sizes, and the company is taking no commercial orders.

As shown in the accompanying photograph, this compressor is small and compact. One unit, which has just been completed and mounted on an ordinary automobile truck especially equipped with a silent chain-drive from the engine shaft for purposes of demonstration, has interior cylinder dimensions of 7½x8¼ in. The weight of the machine, without motor, is 345 lb. Running at 1,000 r.p.m. this machine compresses 180 cu.ft. of free air per minute to 100-lb. gage-pressure in a single stage.



JACKSON COMPRESSOR DIRECT CONNECTED TO A MOTOR

Within the cylinder five wings or blades move with an opening and closing motion from an eccentric on the single central shaft. The space between these blades is thus opened allowing the admission of free air and then closed, compressing and expelling it. The volume of each compartment when at its maximum is more than ⅕ of the volume of the entire cylinder, so that each revolution of the shaft with the accompanying five compressions handles considerably more free air than the normal capacity of the cylinder.

This machine is quite silent in operation. It requires no foundation, and there are no packed joints, all contact surfaces being ground to a tight metallic fit. Since the intake and expulsion of air is continuous, no pulsations are perceptible in either the suction or exhaust. The machine is highly portable and has been experimentally operated while hanging freely in the air suspended by an ordinary rope.

The two outer pipes shown in the illustration admit free air to two manifolds encircling the cylinder, permitting the entrance of air to each of the five compartments through poppet valves. The middle pipe shown is the discharge line. It also connects with each of the five compartments through a manifold and valves. All three of the above-mentioned manifolds are within the water-jacket space surrounding the cylinder.

Lubrication is provided through a drilled hole in the shaft. Oil of a high flashpoint is admitted from an air-pressure reservoir attached to the right-hand side below the shaft. Excess oil collects and passes through the exhaust manifold with the compressed air into a small pipe shown in the illustration and thus back to the reservoir. The oil in the reservoir being under pressure resumes its circuit again, regulation of the amount being effected by a simple valve in the feed line. The lubrication is thus continuous.

This compressor will run successfully in either direction of rotation, but it is designed to operate preferably in one direction only. It may be operated with equal efficiency as either a compressor or an exhauster. Experiments with the machine in the latter service have shown that it will maintain a vacuum of 22⅝ in. of mercury at Denver, which is a good showing considering the altitude.

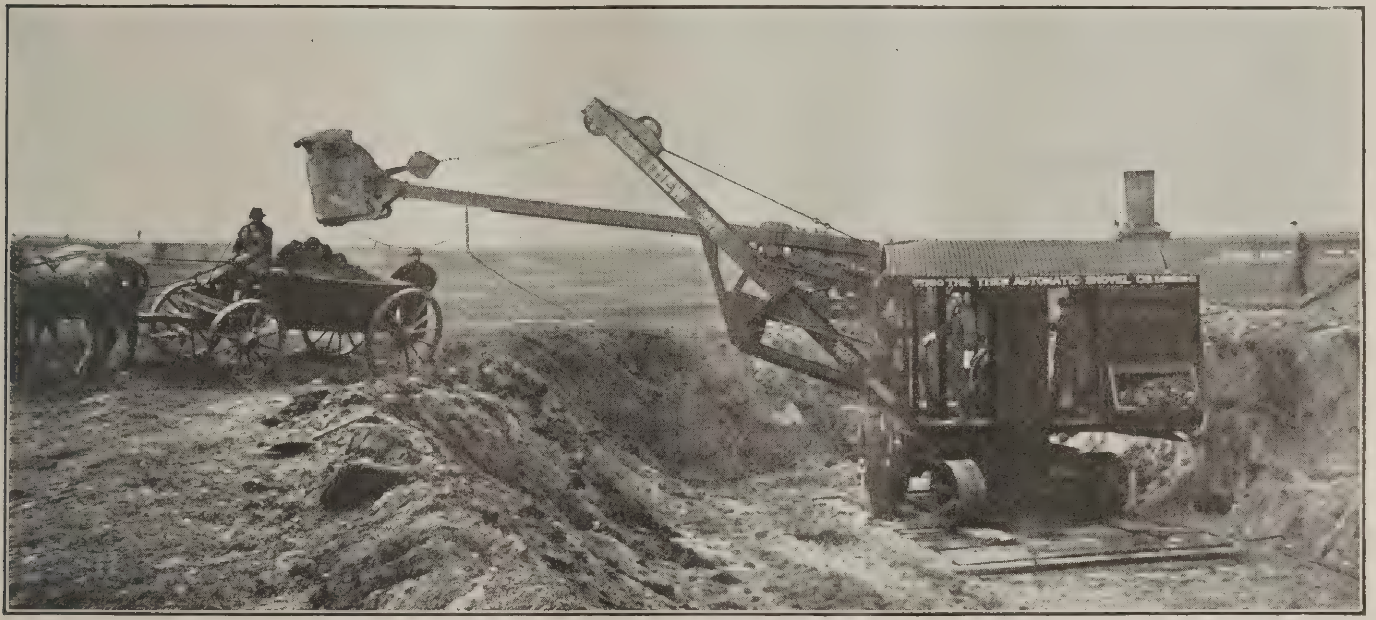
The manufacturers of this machine state that the compressors will weigh approximately one-tenth what piston-displacement machines of corresponding capacities weigh. The strong points claimed for these machines are their lightness, portability and simplicity.

Combination Boom Shovel

A new type of steam shovel, known as the Thew combination boom machine, has recently been placed on the market by the Thew Automatic Shovel Co., of Lorain, Ohio.

In it the Thew horizontal crowding motion is combined with a shipper-shaft mechanism of new design. Thus are secured the advantages of the horizontal crowd for shallow cuts, together with a jackshaft crowding motion which is highly advantageous in deep work and digging trenches or where extended dumping radius or high clearance lift is desirable.

The two crowding mechanisms are independent and noninterfering. Both are operated from the same crowding engine which is merely changed in position. When using the horizontal crowd, the long dipper handle must be removed, and when the shipper-shaft crowd is in use, the short dipper arm is chained to the boom structure after removing the dipper. All changes necessary can be made in less than three hours, while the same dipper may be used with either crowding mechanism.



COMBINATION SHOVEL WITH LONG BOOM AFFORDING LARGE DUMPING RADIUS

The long dipper handle used in connection with the jackshaft crowding mechanism combines lightness and strength. It is made of a single piece of wood, 8 in. square, armored with steel plate and equipped on the under side with a steel rack. Dipper arms may be procured in numerous lengths to suit the requirements of different kinds of work, depending on the depth which is to be excavated, the extent of dumping radius or height of clearance lift desired. A dipper with a 27-ft. stick can dig a trench to 16 ft. below the ground on which the shovel stands, while a dipper handle of this size makes it possible to dump material within a radius of 31 ft., with a clearance of 14 ft.

This combination boom shovel will handle practically any class of work encountered. Either kind of crowding motion may be incorporated when the machine is purchased, the other mechanism being procured and added at a later date as occasion may require. A number of these machines have been in use for several months.

Editorials

Many Mining Machines Are Patented

Of 22 patents pertaining directly or indirectly to the coal-producing industry granted by the Patent Office in the period between July 27 and Aug. 27, no less than five were for mining machines, while nine were for mechanical stokers, pulverized-coal burners, smoke consumers and like appliances.

It might be inferred from the foregoing that those interested in coal production and consumption were lazy and wished to avoid so far as possible the manual labor of mining and burning coal. While we might agree with the latter proposition, we must take strong exception to the former. Man-power is about the most expensive energy purchasable. We pay a laborer, say, \$2 for 9 hr. work. This man is capable of exerting continuously about one-eighth of a horsepower. In other words, we have secured 1⅛ hp.-hr. for \$2, or we pay about \$1.78 for man-power per horsepower-hour.

In marked contrast to this high cost of energy is the cost of current delivered to the motor of a mining machine which should not exceed 2 to 2½c. per horsepower-hour.

It is the realization of this discrepancy between the cost of power developed by man and that developed by a steam engine, for instance, that is driving the coal industry, as well as all others, to employ machinery wherever such employment is possible. Furthermore, it is frequently the case—as in undercutting, for example—that the machine does the work better; that is, it cuts deeper and affords less resultant fine coal than when mining is done by hand.

It is probable that most operations that may be performed by machinery require a greater expenditure of power than would the same operations performed by hand; nevertheless it has become almost axiomatic that it is economical to supplant manual power by machinery wherever possible. Consequently inventors are continually striving to perfect mining machines, stokers and other power-driven devices that will do away with the employment of muscular energy.

⁂

"A Hole in the Ground and a Hencoop Over It"

It is said that this pleasantry is still a common description by anthracite men of a bituminous mine, and it is true that there are many mine openings in the soft-coal regions which it does not much belie. It is these small concerns which play havoc with the industry, not so much because they produce much coal, nor because in any large degree they undersell the market in feeble attempts to keep in business, nor because they often fail to pay union wages, but because they form a sort of apprenticeship to the coal broker who desires to enter the operating end of the profession.

Any business which appears difficult and seems to require special knowledge is by that fact protected from general competition. Everyone realizes that it is a place for "insiders" only, and they leave it severely alone unless they feel sure that they can secure the services of an expert who is technically and morally worthy of their confidence. Even then they enter without plunging. Most of the big industries of the country are extended entirely from the inside, with the capital earned in the business.

Not so the coal industry. Anyone, it is generally thought, can dig a hole in the ground and cover it with a "hencoop." They soon learn that the work is one in which all can indeed engage, but in which profits are few. The corner grocery has the same fatal fascination, and for the same reason it is rarely successful. There are far too many grocers for their profit or for the advantage of the public, and in like manner there are too many coal men—so many in fact that they themselves, their employees and the public suffer.

Many are the coal sales agents who have entered the coal business and realized that while the hencoop was easily constructed it was not easy to escape from under it without considerable loss. In fact, in some districts jobber after jobber has tried his hand at operating and failed, and in those parts the mining of coal has proved a persistent source of loss. As in gold mining, more has been put into the ground than taken out. The only men who made money were the sheriff and county recorder.

Thus it is that the hope of the mine owners is in the elaboration of their plants and in the combination of manufacturing with coal mining. Moreover, the large operators are financially responsible and seek to guard their investments by coöperation. The smaller operator knows only two ways to make money—by reducing the wages of his men and by skimping his mining work. But the larger concern guards itself by introducing real economies, and in time will put more advanced products than coal upon the market.

In this connection it is interesting to note the new dye industry started by the Pearsite Co., in Cannel City, Ky., and largely financed by Col. H. P. Bope, of Pittsburgh, a vice-president of the Carnegie Steel Co. This, of course, is a business in which not many can enter, and Mr. Bope will utilize only cannel coal. But the kind of coal used will probably not be restricted to cannel, and there is a broad field related to dyes where many plants could engage.

The Pearsite Co., named after Arthur L. Pearse, an English engineer whose process will be used, will extract the dyes from oxidized cannel, the oxidation being performed in a furnace. The output will be about 5 tons per day. How much coal will be used in obtaining this product is not stated.

So long as the anthracite mine was a hole in the ground without much capital involved and the industry seemed to need neither brains nor financial resources, the market was glutted and no one made money. In those days there was an abundance of little gouge holes in the anthracite region. Everywhere surface beds were being mined or partly mined and partly left and as much or even more capital was squandered in them than was ever made by their exploitation.

In the bituminous region the simpler methods are fast passing. Plants are far more complicated and the visitor is impressed with the technical skill required. But there are enough country banks with shaky drift mouths, wheezy cars and balky mules to induce everyone who can sell coal to enter the mining business. Only by advancing our methods or extending them into the manufacture of power or byproducts can the coal broker be convinced that the coal industry is too specialized a business for him to "butt in" without some previous training.

Trend of the Coke Industry

The erection of byproduct coke ovens is proceeding more rapidly now than at any time in the history of the byproduct process in the United States. The first retort-oven plant in the country began producing in May, 1893. At the close of 1900 there were only 1085 retort ovens in the United States, the production of coke in that year having been 1,075,727 net tons. New construction proceeded at the rate of a few hundred ovens a year, bringing the total number at the close of 1913 up to 5688.

During this time there was a decidedly rapid expansion in the iron and steel industry, whereby the increased coke production was readily absorbed, and the beehive-oven industry did not suffer seriously, though of course it did not show any expanding tendency. The maximum production of beehive coke was reached in 1907 (35,171,665 net tons), while the maximum number of beehive ovens reported by the Geological Survey was 100,362, for the close of 1910. While occasionally a few beehive ovens are built, the number that work out their coal from year to year and are accordingly abandoned somewhat predominates, so that for the end of 1914 only 93,946 beehive ovens were reported.

In the past year or two the erection of retort ovens has been proceeding much more rapidly than before, while blast-furnace construction has been much slower, and thus the iron industry has not expanded with sufficient rapidity to afford a consumptive demand for all the coke that can be produced. The Connellsville coke market has distinctly reflected this situation.

In December steel conditions began to improve, and up to this date there has been continued increase in steel demand and prices. The production of pig iron by merchant furnaces increased more moderately than did the output of steel, but still it increased materially, and early in July pig-iron prices began to rise, the advance to date amounting to an average of fully $1.25 per ton.

Estimates of the capacity of retort ovens vary widely. A claim is made, for instance, that the best type of retort oven can produce at least 13 tons of coke per charge and can coke a charge in less than 24 hr., or more than 4000 tons a year. On the other hand, an estimate based on the showing for the year 1913 would indicate that if the retorts then in operation had operated steadily throughout the year they would have produced about 2700 tons per retort. Using this estimate, noting that the Geological Survey reported 5809 retorts completed at the end of 1914 and adding the 1000 retorts now being built, it is a conservative statement that the industry is making for a capacity of 19,000,000 tons of byproduct coke a year. On the basis of the 1913 production, with allowance for the fact that the beehive ovens ran at least 10 to 15 per cent. below their capacity in that year, the beehive capacity is about 38,000,000 tons, making a total coking capacity of 57,000,000 net tons.

It is possible to make a close estimate of the probable coke demand. In the past five years the production of coke in net tons averaged 48.3 per cent. more than the number of gross tons of pig iron produced. Coke is used in limited quantities outside the iron industry, but the fluctuations could not affect the calculation materially. The present production of pig iron is about 32,000,000 tons a year, which would indicate a current consumption of coke of 47,500,000 tons annually. But there is a fairly well accepted estimate that the actual capacity of the blast furnaces of America is about 35,000,000 tons, thus suggesting a maximum possible coke consumption of 52,000,000 tons. Against this we have a conservative estimate of 57,000,000 tons for the coke capacity, and if the retorts recently built and those under construction approximate the production claimed possible, the coke capacity is well in excess of 57,000,000 tons.

Thus the analysis of the physical situation as to capacity and demand harmonizes completely with the coke-market situation.

Nearing the Century Mark

"Uncle" James Farrar celebrated his ninety-eighth birthday last week at the home of his daughter, Miss Lillian Pledger, in Birmingham, Ala. He followed his vocation as a coal miner until he was over 75.

It is now a well-recognized fact that miners are healthy and hearty, living to a good old age. Only those who are interested in some way in its disproof will venture to deny that fact. A book by Joseph W. Hays, entitled "Combustion and Smokeless Furnaces," published in 1906, states that "coal mining, barring the physical dangers attending it, is a healthful occupation and the coal miner is usually longlived. Post-mortem examinations have developed the fact that the lungs of the coal miner may be absolutely black with coal dust inhaled during many years and these organs be otherwise in a sound and normal condition."

As far as the United States is concerned it may be said that coal mining is without any occupational disease, unless it be miner's asthma. There are no healthier men anywhere than in the mining industry. Stooped they may occasionally be, owing to the low headroom in which they work and the cramped position in which they are always compelled to labor even if in thick beds of coal. Their carriage may also be bad, due to the "uneven going" underground. Moreover, the miners are not quite as active on a sticky hot day as men whose work normally subjects them to the heat of the sun. But, as has often been proved, these outward marks of their profession do not signify any real lack of vigor any more than the rolling gait of a sailor, which connotes habit and not feebleness, shows a lack of health on his part.

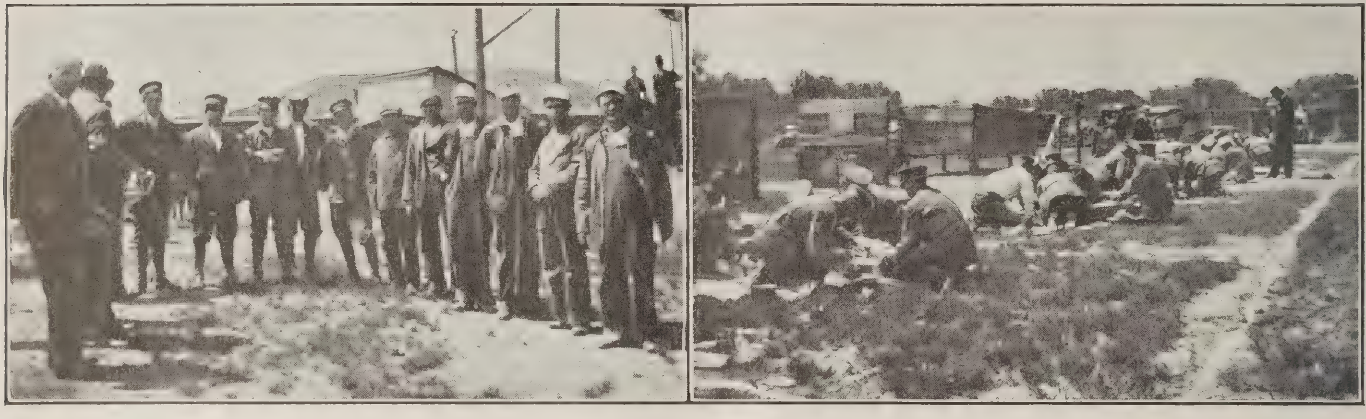
Victor-American Fuel Co. First-Aid Meet

By C. S. Taylor*

About four thousand people witnessed the first-aid contest of the Victor-American Fuel Co. at Walsenburg on Aug. 28. Governor Carlson was unable to be present and Lieutenant-Governor Harper took his place, presenting the silver cup and medal. Three members of the Industrial Commission were present. The contest took place in an arena provided with a grandstand from which at least 500 people, comfortably seated, could see the contestants. The grandstand was trimmed with patriotic folds of red, white and blue. After the events dinner was served at the Klein Hotel. E. P. Linski announced the events. The work in general was considered of more than ordinary merit. The program was as follows:

One-Man Event—Patient struck by pick. Punctured wound on the inner side of the left thigh; severe hemorrhage. Dress and carry without stretcher 50 ft. to the mouth of the drift.



SCENES IN THE WALSENBURG FIRST-AID CONTEST OF THE VICTOR-AMERICAN FUEL CO.

Winning Team and Officials

Five Teams at Work

A TEAM CARRYING REGULATION STRETCHER

Full-Team Event—Rockfall. Compound fracture of both bones of the left leg in middle third; compound fracture first phalanx of the left thumb; compound fracture of the right side of the lower jaw. Dress and carry 50 ft. on a stretcher.

Full-Team Event—Gas Explosion. Burns of first and second degree of face, neck, hands and forearms. Dress and carry 50 ft. without stretcher.

Two-Man Event—Explosion of blasting cap. Right-hand lacerated in the palm and the skin of all four fingers torn by the explosion. Bright blood spurts from the palm and the patient has a severe shock. Dress and carry 50 ft. without stretcher.

Full-Team Event—Victim rolled between car and roof. Simple fracture of the right thigh at the middle third; simple fracture of the left arm at the middle third and of both bones of the left forearm at the upper third. Dress and carry 100 ft. on a stretcher.

The contest closed with Chandler first with 98.1 points, Ravenswood second with 95.8 points. This is the second time Chandler has won the first prize. The judges were J. R. Hall and R. M. Shea, of the United States Army, and J. W. Amesse, of Fort Logan. Others of note who were there were Dr. John R. Espy, of Trinidad, and F. W. Whiteside, chief engineer of the Victor-American Fuel Co., who had charge of the contest and its business arrangements. Pathé took moving pictures of the field work. S. M. Thompson, representing the Mines Safety Appliance Co., of Pittsburgh, presented the captain of the winning team with a Koehler safety lamp.

* * *

State-Wide Meet in Indiana—A state-wide first-aid meet is to be held at Bicknell, Knox County, Ind., on Saturday, Oct. 30, at 1:30 p.m. It will be under the joint auspices of the United Mine Workers of America, the operators of Knox County, the Bureau of Mines and the American Mine Safety Association. The expenses and medals are to be furnished by local unions and operators of Knox County. In the evening entertainment will be provided.

Labor Day Meet at Boulder—A first-aid contest was held at Boulder, Colo., as part of the program in a Labor Day picnic and fair. Six teams representing coal mines in Boulder County were present and competed. A beautiful silver cup was awarded to the team from the Simpson mine under the captaincy of C. E. Dollar. Second place was secured by a team captained by Robert Pendleton, of Lafayette, Colo. The award was based solely upon skill and precision and not on the time consumed in the work. The judges were Drs. F. H. Farrington, Clay Griffin and Carbon Gillespie.

The Department of Mines of West Virginia is issuing a typewritten list of the persons killed inside and outside of coal mines of West Virginia during the month of August, 1915. There were 35 men killed in all—20 Americans and 15 foreigners. Of these, 34 fatal accidents occurred inside and one outside the mines. The statement gives a detailed account of the location and cause of each accident, with the name, nationality and occupation of the victim. The department requests that it be posted in a conspicuous place, with intention doubtless of warning other men of like dangers. However, descriptions of so many accidents in one bulletin are apt to fail in making a direct appeal, such as would be made by one fatality fully described and with its lesson duly accentuated. Still, a long record without comment conveys its message.

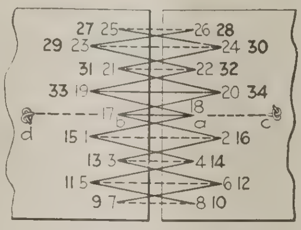
Discussion by Readers

Mining Machinery--Belting

Letter No. 4—Referring to George N. Lantz's letter, No. 3, *Coal Age,* Sept. 11, p. 431, on belt lacing, I should say that there are three points in which this lacing is open to criticism:

First, it is not symmetrical. It would be better to have *c* and *d* in the same straight line with *a* and *b,* not only for the sake of appearance but for even running as well.



AN IMPROVED BELT-LACING

Second, the lacing takes too big a jump from 16 to 17 and is not at its proper angle. The effect of this would be to pull the ends slightly out of alignment.

Third, it is always advisable, wherever possible, to make the same number of passes of the lacing through each hole. In his joint Mr. Lantz makes two passes through most of the holes, but through *a* and 17 he makes three passes.

In the accompanying figure I have shown a method of lacing such a joint that overcomes the objectionable points I have mentioned. To follow the path of the lace, start down through *c,* up through *a,* then to 1, and finally pass from 34 down through *b* and up through *d* and tie.

N. G. NEAR.

New York City.

[This matter of belt lacing has been interesting and instructive. Let some one suggest other points of similar interest in mining machinery.—Editor.]

⁂

Need of First-Aid Instruction

Letter No. 2—In his remarks on the need of first-aid instruction, published in *Coal Age,* Aug. 14, p. 268, James T. Reynolds concurs in all previous suggestions that first-aid instruction should be given more generally to all mine employees. But Mr. Reynolds, in his last paragraph, advocates that "the mining laws of every state should compel all operators to maintain at their plant at least a few trained men who are competent to give first-aid treatment in case of accident."

I agree with everything that Mr. Reynolds had previously said, but think that this last statement should be broadened so that first-aid training will apply to the entire mine force, to the extent that all employees in mines should have at least sufficient knowledge and training to enable them to do the necessary things to relieve one injured in an accident and, if possible, to save life. If it is good to have a few trained men at each mine, it is surely better to have a larger number of men who possess the necessary knowledge and training to make them useful in case of accident. I am of the opinion that before first-aid work can become a thoroughly effective agency in mining, all mine operators and superintendents must maintain training schools at their mines, where all mine employees shall receive sufficient instruction and training to make them of service in time of need. Such a requirement might well be incorporated in the state mining laws.

With a view to greater protection of life and property, most mining laws require all mine officials to pass an examination and hold a certificate of competency before they can act in the capacity of mine foreman, assistant mine foreman or fireboss. I would ask why the mine laws should not require that all miners and mine employees should possess some training in first-aid work before being permitted to work in the mines.

It may be urged that a knowledge of first-aid work on the part of every employee will not eliminate mine accidents; but while this is true, I claim that the possession of such knowledge will often save life and reduce the later effects of the accident that otherwise would be inevitable. The purpose of such a provision in mining law would not be so much to reduce the number of accidents as to lessen their effect.

JOHN ROSE,
Former District Mine Inspector.

Dayton, Tenn.

⁂

Compensation in Relation to Constitutional Rights

In a letter published in *Coal Age,* July 3, p. 25, A. M. Iner makes some interesting remarks on Pennsylvania's recently enacted Compensation Law, and expresses his surprise that so important a piece of legislation should have brought practically no comment in the pages of *Coal Age,* either editorially or otherwise. Further, this correspondent points out what he considers certain bad features of the act, and it must be admitted at the start that if one-half of the fears expressed by Mr. Iner are realized the future holds almost as little encouragement under the Compensation Act as the past held under the old Liability Law, particularly for the injured employee or the wife and children bereaved by the accident.

One readily shares Mr. Iner's surprise that so little has recently been published regarding legislation intended to mean so much to the mining fraternity as well as to other workers in hazardous occupations of the state. But, speaking personally, unlike his, my surprise is an agreeable one, since the quiet acceptance of this "class legislation" by the men of the mining industry indicates a readiness to let the future decide its good and bad features. The complacency of mining men, who as a class are invariably arrayed against anything they conceive to be inimical to their individual or general interests, indicates a satisfaction in the accomplishment at last of a duty long deferred by the state. Most mining men, it would seem, are willing, for the real test of this enactment, to be its practical application. I believe the majority of us are optimistic enough to think that this new Workman's Compensation Law will eventually be proven of inestimable benefit to the state at large, as well as to those men so unfortunate as to come under its provisions and to the widows and children for whom it provides.

In the article to which I have referred the author evidently fears that the miners of this state have "asked for bread and been given a stone." He seems to think that they have sought alleviation of one of the chief burdens of the industry and it has been granted at the sacrifice of certain inalienable, individual and constiutional rights. This, by the way, is one of the antique stock arguments that have ever been used against an equitable, fair, business-like and humane compensation law in this and other countries.

It may be true, as Mr. Iner avers, that this particular act robs the workman and, incidentally, the workman's wife and little ones, or the mother depending on his earnings, of certain individual rights. So does temperance reform rob the drunkard of the means of debasing himself and bringing misery on his family. The cases are analogous in some respects unnecessary to consider here. The act does indeed rob the workman and his family, but of what? It removes the dread of poverty, starvation and pauperism, which were formerly the inevitable result when a workman was deprived, by accident beyond his control, of his ability to labor. Regarding that phase of the question I will not attempt to argue, since, with Mr. Iner, I lament the fact that I am merely a mining man and not an expert on the constitutional rights of the miner to suffer needlessly. However, it does not require a constitutional lawyer to decide which would mean the most to a widow left with a family of small children after the death of her husband—his constitutional rights or 50 per cent. of his wages for five hundred weeks. I have my own opinion as to which of these will go farther toward paying the grocer and butcher and keep the family together in the home, after the father has been removed by death.

Mr. Iner truthfully remarks that, under the present law, an injured workman possesses the right to seek redress through the process of common law where he would stand some chance of proving his claim. But if Mr. Iner is as practical a mining man as his article indicates he will certainly have seen what has convinced me, as it has thousands of others interested in the matter, that the chance of securing anything substantial through the processes of law are very slim indeed. We all know that under the old Liability Law, which remains in effect in Pennsylvania until January, 1916, the injured miner or his widow and children if he is killed at his work have a chance of seeking redress in the courts. But statistics, as well as observation, compel the assertion that the "chance" is about all they will get. The records show that for every miner injured through no fault of his own and awarded an adequate verdict at the hands of the court, there are dozens who should have the same but have not. And those who gained their case received practically nothing, except in rare instances, as the award when made went chiefly to enrich the lawyers.

To refer again to cold-blooded statistics, it has been shown that under the old Liability Law less than 40 per cent. of the money paid by employers in the United States went to the men, women and children for whose care and comfort it was intended. This of itself is pathetic, unbusinesslike and inhumane; but, what is worse, nearly one-half of that 40 per cent. went to the lawyers interested in the case.

The pernicious effect of such a system, which the new Compensation Law expects to replace, might be better understood by quoting from a pamphlet that I read before the West Virginia Coal Mining Institute, at Wheeling, some years ago. Statistics for that article advocating such compensatory laws were laboriously gathered from almost every Government in the world having an accurate tabulation of their several laws governing this matter. But lack of space prevents other than the following quotation taken from the records of a county in Pennsylvania:

> The bad effects of such a system [the method of deciding and paying through the courts] can best be grasped when statistics of one county near here recorded in a given period 304 fatal accidents. Following this, 200 families were left dependent on the whims of courts and juries, and as a result 88 of said families received not one cent of compensation following the death of their breadwinner. Practically the entire 300 men killed were contributing, at the time of their death, to others besides themselves. Ninety-two families received funeral expenses only. Thus 180 of the 304 cases cited were left to bear the entire loss of income. Of the families remaining only 62, or approximately 20 per cent., secured through the courts more than $500—a sum approximating a single year's labor wage of the lowest-paid workman killed.

Surely an equally burdened number of dependents in the future will not grieve over being deprived of any rights at law that gave others in a like predicament such munificent results. Surely no compensation act conceived by civilized men (outside of the legal fraternity) can hold any worse prospect than that.

SIM. C. REYNOLDS.

Houston, Penn.

⁂

Handling Explosives in Mines

Letter No. 1—In considering the various suggestions made in respect to increasing the safety of mining operations and the prevention, as far as possible, of explosions in mines, there is no subject of greater importance than that of handling explosives in the mine. After a long and varied experience in the storage, use and handling of explosives I am led to offer the following suggestions, in the hope that they may be the means of avoiding some of the accidents that are due to carelessness or a lack of knowledge on the part of many whose duty it is to use this dangerous material in their daily work:

Miners should be educated in the storage and, particularly, in the use and handling of explosives. They should not only be given a copy of rules, but should be instructed verbally in this regard. The United States Coal and Coke Co., at Gary is very strict in its observance of these precautions. Each miner is supplied with a copy of the rules, printed in his own language, and given verbal instructions by the company inspector, as well as by the mine foreman and his assistant. If he cannot read he is questioned on the rules until he becomes thoroughly acquainted with what is required.

The following description of the elaborate system employed by the Horden Collieries Coal Co., of England, in respect to the storage, handling and use of the explosives used in their mines will be of interest:

The company's magazine is located 3000 ft. from the tipple. The building measures 12x12 ft., and is 7½ ft. high inside. The walls are of concrete and 8 in. thick. In one corner is a large cupboard for the storage of detonators, while the remaining space is occupied by explosives. The floor and partitions are of wood and wooden pegs are used instead of nails. The locks, hinges and other fastenings are of brass. There is an 8-ft. fence around the building and no one is permitted to enter this inclosure except the attendant, who is supplied with a locked safety lamp and wears rubber shoes.

There is an excellent system employed in distributing explosives to the miners. Each man is supplied with a metallic canister stamped with his check number. Upon reaching the outer door of the magazine, he calls out his number and receives his canister from the attendant, a record of the amount of powder in the canister having been previously made in a book kept for that purpose. At the end of the shift the miner returns his canister to the magazine, when the contents remaining in the can are noted and the quantity used is charged to the miner. The form of this book is as follows:

Date	Check Number	Name	Weight of Powder (Oz.)		
			Issued	Returned	Used

The detonators are never handled by the miners; they are carried into the mine in locked tin boxes by the shotfirers or deputy overmen. Each shotfirer has a number, and this number is stamped on the box containing the detonators in his charge. A record is kept of these detonators in a book similar to that used for explosives. The book form is as follows:

Date	Box No.	Name	Number of Detonators			
			Issued	Returned	Used	Bad

In this mine the coal is undercut by compressed-air machines and the holes drilled by air drills. The mine is divided into separate districts, each district having a deputy overman or shotfirer in charge and one man to drill the holes. The shotfirer carries with him a wooden tamping rod, having at one end a copper scraper. His duty is to clean, charge and tamp all holes, using only clay for the tamping.

The shots are fired with an electric battery, and not less than 50 ft. of cable is allowed to be used in this work. Only one shot is fired at a time. After firing a shot, the shotfirer must disconnect the cable and take the key from the battery, before proceeding to make the connection for firing the next shot. I may say that accidents from explosives and the occurrence of blownout shots in this system of firing are a thing of the past. I am convinced that it only requires a thorough system of storing, handling and using explosives, and a safe and reliable method of firing the shots, to eliminate completely the occurrence of accidents along this line. I hope to see others give their experience and suggestions.

Marytown, W. Va. JAMES THIRTLE.

Labor in Mining

Letter No. 10—The discussion in *Coal Age* in reference to the question of why strikes occur so frequently in coal mining has been one of growing interest. I think that Hugh Archbald, judging from his article on this subject, *Coal Age*, July 24, p. 124, has not had much experience with the United Mine Workers of America. Either that, or he is able to handle them better than the rest of us. I have had some dealings with this organization and am able to say that its chief aim appears to be to get something for nothing, in any way and by any means possible. Its chief weapon is the strike, which always makes someone go hungry, and the men on strike lose more money than they gain.

I recall an instance of this kind where the miners asked for a 5-per cent. increase, but the demand was promptly refused by the operators. A strike was called, which lasted two months, and at the end of that time we went back to work with something like a 2-per cent. increase. But one can readily see that had the full 5 per cent. been granted the men, this would not have made up for the two months' full pay lost, as the following figures will clearly show:

The average earnings in this district were \$65 a month, or \$780 a year. Adding the 2 per cent. allowed, increased this pay to \$66.30 a month, which amounted to \$663 for the entire 10 months following the strike. This showed a loss of \$780 — \$663 = \$117 for each man for that year. Had the full 5 per cent. increase been allowed, the pay would have been \$68.25 a month, which would have amounted to \$682.50 for the entire 10 months following the strike. This would have shown a loss of \$780 — \$682.50 = \$97.50 for each man during that year.

But these figures do not show all that the strike cost the men, as miners always spend more when they are idle than when they are working. I can heartily endorse every word that S. A. Driver has said in his Letter No. 8, Aug. 28, p. 349. I want to congratulate Mr. Driver for the letter he has written, which exposes the whole scheme of labor organizations as they have been conducted. This letter should be read by every member of the union, and especially by union leaders, who should profit by the lessons taught therein. I believe thoroughly that the operator of a mine should have the authority and the right to choose his own working force and to hire and discharge his men at will. This is the only way in which discipline can be maintained in the mine. No men or organization of men should be permitted to usurp this authority in respect to the employment of workers in the mines.

In my experience I have frequently known the pit committee to present complaints that did not come from the men but emanated solely from the committee. When certain rules were posted at the mine it would often happen that the committee would object to their being enforced, claiming that the matter was not mentioned in the contract and stating that trouble would follow if the rule was not rescinded.

Another instance that I recall was where an assistant foreman used a driver to run a motor for a few days when the motorman was absent from the mine. A little later a vacancy was quickly filled by a competent motorman, which was a proper thing for the company to do. The miners, however, took exception to this, claiming that one of their own men should have been chosen for the place. Failing to obtain any satisfaction from the superintendent, the matter was taken up by the committee with the district officials of the union. The result was that the new motorman was charged with "taking a job from a brother miner." These facts illustrate how the principles governing the union work against the efforts that are being made by coal operators for the betterment of the miners. When so much has been done to improve their conditions in the mine and living conditions in the camp, it is discouraging to companies to have to face these conditions, for which the union alone is responsible. It requires a big-hearted man to overlook the foibles of this class of mine workers, who I am glad to say are greatly in the minority.

What a boon it would be to coal mining if every mine worker would consider the interest of his company as his own interest, and the operator, in turn, regard the welfare of his employees as his own welfare. It would not be long then before trouble makers would be forced to find other employment than that for which they are paid by the union. That would be a glorious day for the mining industry. The industrious mine worker would feel more at ease and be able to settle down and make his own home, where he could live in cheer and comfort with his family.

Mr. Driver has illustrated well the true conditions growing out of the influence of the union to compel a fixed wage scale, where he cites the case of a man who had worked in the mine all his life but was compelled to accept the same day wage as another man who had never been in a mine until the day he was given a job greasing cars at the bottom of the shaft. I think with Mr. Driver that it is difficult to understand how Mr. Archbald, an efficiency engineer, can advocate these principles from his standpoint.

It cannot be wondered that men who have striven by study to improve themselves that they might qualify for a higher position should be discouraged. It is often remarked, "What is the use of studying to fit yourself for a higher place, when the union will see that you get the place whenever there is a vacancy?" I have heard men remark more times than I can tell that "there is no use to study any more when everybody draws the same pay." Again, "If the boss finds that I know more about some things than the other fellow he will impose upon me, and it is better that I should not know so much, unless I can get more pay."

An honest worker, striving to better himself and do better work for the company, gains nothing, but rather loses, because he accomplishes more than his fellow-worker, but is paid the same scale. For his pains he is often called a company's "sucker"—a term that is the next thing to being called a "scab," in return for which any man will fight. This discussion has done much good, and if men will heed what has been suggested the future will see a great improvement. There will be developed a class of miners striving to provide for their families good homes and anxious to become loyal citizens.

ASSISTANT FOREMAN.

Bevier, Ky.

⁂

Study Course in Coal Mining

By J. T. Beard

The Coal Age Pocket Book

The Circle—In the mensuration of the circle, the ratio of the circumference of the circle to its diameter is a constant factor, which is the same for all circles and is designated by the Greek letter (π) pi.

Value of π—The length of the circumference of a circle cannot be expressed exactly in terms of its diameter, although numerous attempts have been made since the time of Archimedes, and the value of π extended to 35 decimal places without reaching a final result. For all practical purposes, however, this value is $\pi = 3.1416$.

Formulas—Calling the radius **r**, diameter **d**, circumference **C** and area **A**, for any circle:

Circumference, $$C = \pi d = 2\pi r \qquad (1)$$

Diameter, $$d = \frac{C}{\pi} = \frac{C}{3.1416} \qquad (2)$$

Radius, $$r = \frac{d}{2} = \frac{C}{2\pi} = \frac{C}{2(3.1416)} \qquad (3)$$

Area, $$A = C \times \frac{r}{2} = \pi r^2 = 3.1416\, r^2 \qquad (4)$$

$$A = \pi\left(\frac{d}{2}\right)^2 = \frac{\pi}{4} d^2 = 0.7854\, d^2 \qquad (5)$$

The Arc of a Circle—An arc of a circle is a portion of its circumference. The arc is measured by its subtending angle, or the angle it subtends, which is the angle formed by the two radii drawn to the extremities of the arc. Thus, in Fig. 1, the arc AmB is measured by the subtending angle AOB; the arc BC by the angle BOC; and the sum of these two arcs, or the semicircle ABC is equal to 180 deg. or two right angles, the full circle or circumference being 360 deg.

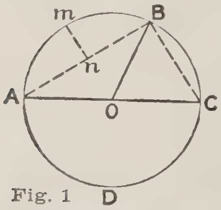


Fig. 1

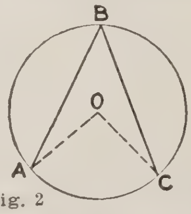

Fig. 2

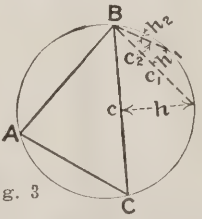

Fig. 3

The Chord of an Arc—A chord of an arc is the straight line joining its extremities. A straight line joining any two points of the circumference of a circle and not passing through its center is a chord of that circle. In Fig. 1, the dotted lines AB and BC are chords; but the line AC, passing through the center O, is the **diameter of the circle.**

The **rise of an arc** of a circle is its perpendicular distance from the chord, at its center. Thus, in Fig. 1, the line mn, drawn perpendicular to the chord AB, at its middle point n, is the rise of the arc AmB.

The Coal Age Pocket Book

A **segment of a circle** is that portion of the area of the circle bounded by a chord and the arc it subtends. Thus, in Fig. 1, AmBn is a segment of the circle ABCD.

A **sector of a circle** is that portion of its area bounded by an arc and the two radii drawn to its extremities. Thus, in Fig. 1, OAmB is a sector of the circle ABCD.

Calculation of Area—The area of a sector or segment of a circle, like that of the circle, can only be approximated. If the angle subtending the arc of the sector or segment is given the **area of the sector** is found by multiplying the area of the circle by the ratio of the given angle to 360 deg.

The **area of the segment** is then found by subtracting from the area of the sector, the area of the triangle formed by the chord and the two radii. The area of this triangle is equal to the product of the half-chord and the radius less the rise of the arc.

When the subtending angle is not given, the area of a sector must be found from the length of its arc; thus,

Area of sector = ½ *length of arc* × *radius*

Not knowing the subtending angle, the length of the arc must be calculated from its chord and rise or the radius of the circle. This calculation depends on a principle that admits of a close degree of approximation.

Principle—The chord of any arc of a circle is a mean proportional between the diameter and the rise of twice that arc.

The repeated application of this principle makes it possible to calculate successive subchords, or chords of half the preceding arc. Each successive subchord more closely approaches the line of the given arc.

Formulas—The following formulas are employed:

Let l = length of arc;
h = rise of arc;
c = chord of arc;
($c_1, c_2, \ldots c_n$, successive subchords)
n = number of subchords;
r = radius of arc.

First subchord, $$c_1 = \sqrt{2rh}$$

Rise of half-arc, $$h_1 = r(1 - \sqrt{1 - h/2r})$$

The next successive subchord and rise are then calculated by substituting for h the value of h_1 found. This process can be continued to any desired number (n) of subdivisions. The last subchord (c_n) multiplied by the number of subdivisions (n) will be approximately the length of the arc.

Length of arc, $$l = nc_n = 2n\sqrt{h_n(2r - h_n)}$$

Area of sector, $$a = \frac{lr}{2} = nr\sqrt{h_n(2r - h_n)}$$

Area of segment, $$a = nr\sqrt{h_n(2r - h_n)} - \frac{c}{2}(r - h)$$

Inquiries of General Interest

An Electrical Transmission

I want to inquire as to the actual advantage in the operation of a direct-current dynamo at our power plant. At this plant we have two direct-current machines, each having a capacity of 150 kw. at 250 volts. The line transmission consists of four large copper wires extending from the power house to the mine. The first mine is located at a distance of ¾ mi. from the power house, while the second mine is at a distance of 1½ mi. from the power house, and the entry in this mine is almost a mile long. At present we are operating the two dynamos in parallel. I would like to ask, Would it be better to separate the transmission lines leading to these mines and operate the dynamos independently of each other?

Is it possible to use the rails of the tracks for the return current? Also, at what distance would you advise to discontinue the use of a direct-current dynamo and install in its place an alternating-current machine?

M. K. Marlowe.

Block, Tenn.

The choice between the use of a direct-current and an alternating-current machine in electrical transmission is purely an economic consideration. It is generally better to employ a direct-current machine whenever the distance is such that the line drop is not excessive. The available voltage at the end of the line must be sufficient for the load at that point. When it is possible to use a direct-current transmission, the necessity for converting the current, by means of a rotary converter or a motor-generator set, is obviated. On the other hand, it often happens that the length of transmission is such as to require the use of the alternating current, in order to avoid excessive expense for copper. Another feature that must often be considered is the price of electricity. When this is high, it may often prove advisable to adopt an alternating-current transmission, which permits the use of a higher voltage and a smaller current, requiring less copper for the same work to be performed. However, a change from direct-current to alternating-current transmission may necessitate changing the mine motors. These questions must all be considered beforehand.

In the present case it may be stated that there would be a decided advantage in operating the two machines independently, using a separate line transmission for each mine. By this means the available voltage at each mine could be regulated to suit the conditions of transmission, and it would not be necessary to operate the motors at the nearer mine at an unnecessarily high voltage, such as is required for the longer transmission of current to the second mine.

In reference to the use of the track rails for the return current, this should always be done when it is possible to provide and maintain a good bonding of the rails. By the use of a rail return the cost for copper is reduced, the double trolley system is eliminated and the rail return reduces the total resistance for transmission.

No distance can be stated as the limit for the employment of a direct-current transmission, since for the reasons given the choice between direct and alternating current depends on many conditions not named in this inquiry. It is a matter that must be worked out for each individual case by a competent electrician who is fully acquainted with the requirements in any particular case.

To Rescue a Drowning Person

Can you inform me of the best method to adopt to rescue a drowning person? In other words, if a man was seen to be drowning in deep water, and a good swimmer went to his rescue, what method should the swimmer adopt; and how should he approach and handle the drowning man, in order to protect himself and rescue the man?

Rescuer.

Oakview, Colo.

The first consideration of a rescuer in a drowning accident is, obviously, self-preservation, for only in this way can a double tragedy be avoided. A poor swimmer should never go to the rescue of a person drowning in deep water except in a boat or supported by other means that will assist him in effecting the rescue. There is more or less exaggeration, however, regarding the danger attending the rescue of a drowning person by a strong swimmer. The chief requirement in this case is that the rescuer shall keep reasonably cool, use his judgment and endeavor to reassure the victim in a manner that will tend to restore his self-confidence.

When attempting a rescue under the conditions described, one should maneuver so as to approach the victim from behind. He is then in position to grasp the person by the arms near the arm pits. Then, if he is expert in the water, it will not be difficult for him to swim on his back, propelling himself with his feet and holding the sinking one over him, taking care to keep his mouth above the surface of the water. If the rescued one offers no resistance, the rescuer may be able to hold him in position by placing his left hand under his chin, which will leave the right arm free for swimming.

If the victim struggles violently, however, it may be necessary to adopt drastic measures and render him unconscious by a blow on the head, which is not always possible. It is better to hold the head of the drowning person under the water until he becomes quiet. In case the drowning man succeeds in locking his arms about the rescuer so as to render him powerless, the latter may be able to hold his breath under the water in hopes that the other will relax his hold. Such an event presents the most serious aspect that could arise and must be carefully avoided, if possible. The best means of breaking the death grip of a drowning person is to raise one or both knees and thrust them against his or her chest. The entire strength can thus be used to force the struggling person to loose his grip on the rescuer.

Examination Questions

Tennessee Examination for Mine Foremen, Etc.

(*Continued from Last Issue*)

Ques.—If you were in charge of a "Class-A" mine, employing an average of 100 men and 10 mules, how much air would be required, in order to comply with the mine law? Would you be satisfied with this amount of air, and if not, how much air would you require for the ventilation of the mine?

Ans.—Sec. 9 of the Tennessee mining law designates a "Class-A" mine as one "known to liberate firedamp (CH_4) at present or in the future." For such a mine the law requires a circulation of 150 cu.ft. of air per min. for each person and 600 cu.ft. per min. for each animal employed in the mine. To comply with this law, the volume of air supplied to the mine must be $100 \times 150 + 10 \times 600 = 21{,}000$ cu.ft. per min. Under general working conditions this volume of air would be insufficient for the thorough ventilation of a mine of this size generating marsh gas in considerable quantity.

The volume of air required for efficient ventilation of the mine will depend on the number of splits and the area of the air passages, in addition to the number of men and animals employed in the mine. In any case the velocity of the air current must be sufficient to effectually sweep away the gases that would otherwise accumulate in the working places and in the void and abandoned places in the mine. Also, the air volume must be sufficient to dilute the gases generated so as to render them harmless. The velocity of the air sweeping the working faces should be from 200 to 300, or even 350 ft. per min., depending on the quantity of gas generated.

Ques.—In a wreck that causes a trolley wire to fall, if a man receives a shock and, becoming unconscious, falls on the wire, describe in what different ways you would try to rescue him from danger and how you would attempt to resuscitate him after getting him off the wire.

Ans.—Replying to the first question, grab him by his loose garments if these are dry, and jerk him quickly in a way to remove him most readily from the wire. If a dry pole or stick is at hand this may be used to roll or push him from the wire. A dry coat or jacket or anything at hand will be useful to employ in grasping the man and dragging him from his dangerous position. In any event, avoid standing in water or coming in contact with his wet clothing. Of course if rubber shoes or gloves are available, these should be used as being good insulators. Always stand on dry ground or a dry board, and avoid, by all means, coming in contact with a live wire or rail. The trolley wire may be safely cut by a sharp ax or hatchet having a dry wooden handle. It is well to grasp the handle with a dry cloth or piece of clothing, or, better still, a silk handkerchief, as silk is one of the best of insulators.

Replying to the second question, in order to restore the man to consciousness or to invigorate him if still conscious, the treatment to be employed after he is removed from contact with the wire is artificial respiration. This should be done promptly. The Schaefer method is the best to adopt. In this method the man is laid at full length on the ground, with his face down, care being taken to see that his mouth is open and that the tongue falls forward. The head should rest on one arm, while the other is extended above the head, which is turned slightly to one side to permit the free access of air to mouth and nostrils. Kneeling on one side, or astride of the man, without resting on him, the operator places the palms of his hands on the short ribs across the small of the man's back, with thumbs almost touching. Then, by alternately pressing downward, so that the weight of the operator's body compresses the chest of the victim, and rising again so as to give opportunity for the chest to expand, and repeating these movements at the rate of about 12 to 14 a min., the action of breathing is duplicated and air induced to enter the lungs.

Ques.—What are the main points to be considered in respect to a good mine door?

Ans.—First, the door should be located, as far as practicable, in a straight portion of the entry, and under good roof where the opening is not too wide. It should never be located at the foot of a grade, where cars may not be under control. Second, a substantial frame should first be erected in the entry by setting two good posts, one on either side of the road, a short distance outside of the rail. If no crossbar is used at the roof a heavy plank should be spiked on the outby side of these posts close to the roof. This should extend the full length of the entry, from rib to rib, a lighter post having been set close to each rib. The open space on each side of the road is now closed by nailing short boards to the posts, and the entire frame is calked with waste or old canvas so that it is air-tight. The door itself is made of a double thickness of boards nailed together and framed diagonally or on the bias, so as to provide a sufficient support and prevent the sagging of the door. This is hung on the intake side of the door-frame and given a slight fall, so that it will be impossible for it to remain open unless it is propped back or otherwise held.

Ques.—State the advantages and disadvantages of the use of curtains instead of doors, and explain where you would prefer to use a curtain instead of a door, giving the reasons why.

Ans.—A door has the advantage of being more permanent and deflecting the air more completely than a curtain, while a curtain is more quickly hung and costs less than a door, besides presenting less obstruction in the entry in case a driver loses control of his car.

A curtain is generally preferred where it is desired to partially split the air, sending a portion of the current through the rooms, while a small scale of air continues to travel the entry. Also, wherever the arrangement is only temporary, and quite generally in the workings, while doors are usually preferred on main haulage roads and airways and between sections of the mine.

Coal and Coke News

Washington, D. C.

Information from the Canal Zone shows that work on the coaling facilities there is progressing fast. At the Pacific Terminal the erection of the unloader towers is going rapidly forward. Excavation at the west end of the unloader towers and wharf was continued during August. At the reloader wharf work has continued on excavating caissons placing excavating steel and sealing the caissons. The excavation in the caissons amounted to 1,162 cu.yd., 336 cu.yd. of which was hard rock. To date 76 caissons are under way and 48 sunk to rock.

At the Atlantic Terminal eight of the end wharf caissons have been sealed and seven filled with concrete. Eighty linear feet of floor containing 655 cu.yd. were poured for the unloader wharf and 200 lin.ft. of floor containing 1,365 cu.yd. were poured for the reloader wharf. Caisson foundations for the unloader and reloader wharves were completed.

At the end of the month excavation was completed in all but six of the 31 caissons. The erection and riveting of deck steel for both unloader and reloader wharves were entirely completed. The installation of hoppers and chutes on bridges and bridge diggers is proceeding rapidly. The operating cabs on diggers have been partially enclosed, and transformer house and controller coops completely housed with corrugated iron and siding, but no floors installed.

Steel for all four towers is about 99 per cent. completed and 98 per cent. riveted. Fuel oil plants have likewise been carried much further toward completion, the building being substantially completed at the Mount Hope plant and well advanced at Balboa.

Trade Commission to Again Get Into Action

It is expected by the 25th of September practically all, if not all, of the members of the Federal Trade Commission will have reached Washington ready for resumption of work. One or two are already in residence. It is stated that many complaints and various letters of inquiry concerning mining enterprises of various descriptions have reached the Commission from investors and others.

There were already a good many inquiries and communications from small stockholders and representatives of minority stockholding interests who desired aid in different ways from the Commission. One of the first pieces of work to be undertaken by the Commission will be a report on the hearings hitherto held both before and during the recent trip.

PENNSYLVANIA

Anthracite

Weatherly—The Lehigh Valley Coal Co. has just put into operation a new mine on Buck Mountain and has named it Council Ridge colliery.

Bloomsburg—Judge Evans, of the Columbia County Court, has issued an opinion restraining the County Commissioners from refusing to print the name of Keran Donahue as a candidate for mine inspector at the primary election. This case was similar to the one brought in Schuylkill County in which it was sought to prevent nominations for mine inspector on the ground that it was a state office and could not be voted on at a county election. In this latter case the Supreme Court granted a supersedas and it was on this bill that Judge Evans based his opinion.

Lansford—After making full time practically all summer the collieries of the Lehigh Coal & Navigation Co. in the Panther Creek Valley were compelled to shut down recently from Friday night until Wednesday, due to a lack of orders caused by the unprecedented heat wave which gripped the eastern seaboard for about two weeks.

Scranton—An explosion in the Surface Vein in the National mine recently tore through to the surface and wrecked the garden of Frank Mangan. Vegetables were uprooted and thrown high in the air. This explosion occurred about two miles from the National Colliery.

Duryea—While at work in the Hallstead mine of the Delaware, Lackawanna & Western Coal Co., five men were recently burned by gas, three receiving serious injuries. They were all, however, taken to their homes in Duryea, and at Simpson.

Bituminous

Connellsville—Production of coke throughout the Connellsville region recently attained approximately 390,000 tons per week with shipments at about the same figure. Stock coke has practically disappeared from the region.

Star Junction—Preparations have been made by the Echard Coal & Coke Co. to put the plant in readiness to start. Orders for firing the ovens are expected shortly.

WEST VIRGINIA

Charleston—West Virginia coal operators who ship their products to Western markets over the four trunk line railways operating in West Virginia will make a centralized fight against the proposed 60 per cent. increase in freight rates for the transportation of coal to Western points. While the tariffs proposing the increase have not yet been filed with the Interstate Commerce Commission by the railroads, the operators have been informed that they are now being prepared.

Eccles—The hoisting engineer for the New River Collieries Co. was recently arrested for neglect of duty, brought before a justice of the peace and fined $50. The engineer had charge of the operation of the fan, and was found asleep on duty. As a consquence of his neglect the fan had greatly slowed down in speed, thereby endangering the lives of those at work in the mine. This occurred at shaft No. 5 where the explosion of Apr. 28, 1914, occurred.

Charleston—Thirty-five men were killed during the month of August in the mines of West Virginia. As usual, falls of coal and slate were responsible for most of the fatalities.

ALABAMA

Birmingham—The Alabama Safety Association will hold a big field day meet on October 8 at the State Fair grounds and the State Fair will coöperate with the association in making awards.

Lewisburg—The coke ovens of the Alabama Co. at Lewisburg and Brookwood have been relighted after being shut down for several months. The two furnaces of this company at Gadsden will probably be started soon.

KENTUCKY

Lexington—An all-day meeting of the board of directors of the Kentucky River Coal Corporation was held recently in this city, attended by the leading officers of the company. President W. S. Dudley, of Lexington, presided. It was stated after the meeting that routine business, details of organization, etc., were given the attention of the members present. A large number of leases of coal lands held by the company were passed on, it is said.

Pikeville—The coal business throughout this region is showing considerable improvement, and it is believed that this improvement means a similar change in the business of railway companies. Various improvements are being installed throughout this region in anticipation of a heavy output next year.

OHIO

Bellaire—The Blakewell Coal Co. recently ordered out a force of 10 men to report at its Georgetown mine to clean up and repair the development. It is believed that this mine is about to resume operation. When working full it employed 150 men, but has been idle since the start of the strike over a year ago.

Gloucester—Mine No. 22 of the Hisylvania Coal Co. was put out of commission recently, because of an accident to the machinery. The damage will be repaired within a week.

Athens—Mine Inspector J. M. Roan, assisted by a corps of helpers recently opened mine No. 211 of the Sunday Creek Coal Co., located near Athens, which was sealed up last May, following a disasterous fire. When the mine was opened it was found that the fire had burned itself out and that a large quantity of coal had been consumed. The fans were started and ventilation established. The Sunday Creek Coal Co. will not operate the mine for the time being, as all of its Ohio mines are closed.

New Straitsville—The Jones Bros. mines near New Straitsville were seriously damaged by a flood a short time ago. Damage was also done to a Sunday Creek mine at Nelsonville and a mine of the Corning Mining Co. at Corning.

INDIANA

Brazil—Clay County is beginning to fear that coal stripping operations are going to interfere materially with agricultural pursuits. The Ehrlich Pierce Co. of Turner, Ind., has begun stripping on 1,000 acres near Staunton and there are several other stripping pits mining at a depth of 9 to 30 ft.

Washington—An unusual occurrence—lightning entering a coal mine—is reported from the Cannelburg mine of the Daviess County Coal Co. The bolt struck the top of the tipple, ran down the sides to the water pipes and entered and lighted up the mine where 100 men were at work. Four men were in the weighroom through which the bolt passed. They were uninjured.

Oakland City—An explosion in the T. C. Bugg mine recently injured one man seriously and three others slightly. The mine had been idle while a new tipple was being built and the men entered the workings before the air had been thoroughly circulated.

COLORADO

Denver—The Colorado Fuel & Iron Co. has posted, at its numerous coal mines in Colorado, notices to the effect that hereafter no man over 49 years of age, or apparently over that age, and no boy under, or apparently under, 16 years of age, will be given employment. This rule has been made by this company as a precaution against excessive demands for indemnities under the new employees law but it does not affect those men or boys in the employ of the company prior to Sept. 1, 1915. In the future, according to this same rule, each new applicant for employment must, if requested, submit to a medical and physical examination by the company's physicians.

The state industrial commission has notified the coal operators of Colorado that no reductions will be made under the new workmen's compensation law from the rate already in use under the old line insurance companies, namely $7.47 per $100 of payroll. This rate when compelled to be paid will make the cost of compensation insurance run into high figures, and the matter is arousing much discussion among the coal men. Many of the large companies are opposed to having insurance written in the state fund as the latter carries the coal mine risk. It is understood that a number of the coal operators will form a mutual insurance company, as they are authorized to do under the law. Others of the large concerns will prefer to carry their own risks and file a bond with the commission to guarantee payment of compensation losses.

ILLINOIS

Chicago—The Southern Illinois Coal Operators' Association has filed with the Interstate Commerce Commission a petition asking for a rehearing of the Western rate case.

Danville—Control of the Dering Coal Co. properties at Westville and West Frankfort has passed into the hands of the Producers Coal Co., which is headed by F. S. Peabody. This firm will operate the property for the Continental & Commercial Bank, and for Kuhn, Loeb & Co., of New York.

La Salle—It was announced recently by the La Salle County Carbon Coal Co. that its mine on East First St., La Salle, would shortly begin operation with a full force of employees. For some time past preparations have been made for starting, while during the period which the mine had been shut down, a number of improvements have been made. Two hundred and fifty men, and possibly more, will resume work at this operation.

FOREIGN NEWS

Nuneaton, England—Several hundred miners were trapped at Exhall colliery Sept. 21 as the result of a fire. The cage employed to bring workmen to the surface was destroyed, but out of about 250 miners in the colliery at the time of the disaster, 200 were rescued by means of an emergency shaft.

Essen, Germany—It is reported that the German Coal Syndicate has been prolonged for 15 months. It was apparent that the Syndicate would be dissolved at the expiration of the present agreement, but the federal council issued a decree for a compulsory organization under government auspices unless the mine owners settled their differences.

PERSONALS

William J. Harris has been appointed Pittsburgh representative of the Star Manufacturing Co. of New Lexington, Ohio.

W. C. Coke and G. B. Taylor, both of Pittsburgh, have been appointed explosive chemists in the Bureau of Mines at Pittsburgh.

Benjamin N. Ford of Cincinnati has been appointed receiver for the Templeton Coal Co. of Dolan, Harrison County, Ohio. His bond was fixed at $10,000.

John L. Kemmerer, secretary and treasurer of the Kemmerer Coal Co., accompanied by his wife, has gone on a hunting trip for big game in the Fall River Basin of Wyoming.

J. N. Sherer was recently appointed sales agent for the Producers Coke Co. at Uniontown, Penn., in place of Richard Peters, Jr., who recently became allied with the William J. Rainey interests.

Lot Jenkins of Martins Ferry, Ohio, has been promoted from custodian of the Ohio mine rescue car "Buckeye," to mine inspector of the eighth district. Mr. Jenkins' headquarters will be at Martins Ferry.

Albert L. Allen, assistant to the general manager of the New York State Workmen's Insurance Fund, was recently elected assistant manager of the Pennsylvania fund, and instructed to start work on forms, schedules and other preliminaries.

Walter Peterson has been appointed as sales agent of the Susquehanna Coal Co. with headquarters at No. 1 Broadway, New York City. Mr. Peterson succeeds George H. Bressette, who resigned after several years service. Mr. Peterson was formerly connected with the Staple Coal Co. and the Pittsburgh Coal Co. He is well known among the coal trade.

Lowther Ferris, formerly general sales agent of the Wellington-Comax Agency, Ltd. (Canadian Colliers, Dunsmuir, Ltd.) of Victoria, B. C., has organized and will become general manager of the Columbia River Coal Dock Co., of Portland, Ore. Large docks for coal storage and ship bunkering are to be erected at once on North Portland Harbor at North Portland, Ore.

Irving R. Gard has been appointed consulting engineer for the Columbia River Coal Dock Co., of Portland, Ore. He will design and superintend the construction of the coal bunkering and storage docks which this company will erect at once on the Columbia River near North Portland. The plant, when completed, will be the largest and most efficient in the Pacific Northwest.

Willis H. Brown has been chosen as vice-president of the Seiler-Blanchard Co., of No. 1 Broadway, New York City. He is well and favorably known among the coal trade in the eastern part of the country. Mr. Brown was for several years connected with the Skeele Coal Co., of 90 West St., both as general sales manager and as vice-president. The Seiler-Blanchard Co. will occupy larger quarters on the ninth floor of No. 1 Broadway in the near future.

Walter Schlagier, paymaster for a colliery near Wilkes-Barre, Penn., was waylaid by robbers, who took from him $1,100 in cash, besides valuable jewelry. The robbery took place near a stripping just beyond Keystone, to which point he had been escorted by state police as a matter of precaution. He had hardly traversed a half mile when he was assailed by four men and after being relieved of his valuables was wired to a tree. State police are scouring the territory and hopes are expressed that the culprits will soon be in custody. The paymaster was not injured in any way.

INDUSTRIAL NEWS

Denver, Colo.—The National Fuel Co. recently awarded a contract for a new wood tipple at the Shamrock mine to the Roberts & Schaefer Co. of Chicago.

Pittsburgh, Penn.—Five million tons of coal held up in the Kanawha River awaiting a favorable stage was recently started southward. The majority of the shipment was to Cincinnati.

Charleston, W. Va.—The Cabin Creek Consolidated Coal Co. has awarded a contract for a Marcus coal tipple equipment for installation at Kayford, W. Va. to the Roberts & Schaefer Co.

Wilkes-Barre, Penn.—A case involving approximately $2,500,000 was recently placed on trial before Judge H. A. Fuller. This suit is that of the Delaware, Lackawanna & Western R.R. against the Kingston Coal Co., and concerns the construction and execution of coal leases and mining contracts dating back to 1878.

New York, N. Y.—The Wolf Safety Lamp Co. of America, Inc., has removed from 49 West St., to 74-80 Washington St., New York City. The new factory, as well as the offices of the above company are now located at the Washington St. address. Lamps are now manufactured complete at this address as well as all component parts thereof.

Bluefield, W. Va.—A special term of the Federal District Court to convene on Oct. 12, is scheduled to hear an ejectment suit of the Pocahontas Coal & Coke Co. against Milton Curtis and others. The question at issue, it is understood, is the matter of mineral rights. The case has been on the docket of the Federal Court for the past two years or more.

Winburne, Penn.—Messrs. Peale, Peacock & Kerr, of New York, recently awarded the contract for a two-track steel tipple with car haul for mine No. 9 at Winburne ,Penn., to the Roberts & Schaefer Co. of Chicago. They have also let a contract to the same company for a Marcus patent picking table screen for mine No. 24 of the Russell Coal Mining Co. of Russellville, Penn.

Fairmont, W. Va.—Condemnation proceedings by the Western Maryland R.R. Co. to secure rights of way for the construction of the Fairmount-Helens Run R.R. will be heard at a special session of the Circuit Court called for Oct. 8. Much trouble has been experienced by the Western Maryland in procuring rights of way, and as a result it is deemed necessary to resort to condemnation proceedings.

Philadelphia, Penn.—The Philadelphia & Reading Ry. Co. has advertised for sale the equipment of the barges "Tunnel Ridge" and 'Coleraine," which went ashore at Highland Light Apr. 3 last. The vessels are so hard and fast aground that it has been decided that it would be too expensive to float them and the decision was therefore made to sell all the fittings such as boilers, chains, spars and windlasses.

Huntington, W. Va.—Coal loadings on the Chesapeake & Ohio Ry. for the first 16 days of September, 1915, have increased more than 100,000 tons over loadings for the same period of a year ago. From Sept. 1 to 16 inclusive, 1,260,770 tons of coal were loaded on the Chesapeake & Ohio while during the same period last year only 1,139,180 tons were handled. This shows a difference in favor of 1915 of 121,590 tons.

Des Moines, Iowa—The State Mining Department of Iowa, as the first important step in an educational campaign throughout the state, installed a coal exhibit in the mines and mining building at the State Fair. It was endeavored by every means possible to impress upon visitors at the Fair the value of the mining industry of the state. Coal from more than 100 mines in 23 counties was shown, one lump weighing over 2,000 lb.

New Haven, Conn.—There has recently been formed an organization among graduates of Yale University known as the Yale Engineering Association. While any Yale graduate is eligible for membership, the Association naturally appeals most strongly to those engaged in engineering manufacturing or transportational pursuits. It is proposed to hold the first meeting of the Association in New Haven, Conn., the early part of November.

Baltimore, Md.—The Baltimore & Ohio R.R. has announced plans for a giant new coal pier in this city to supplement the present pier at Curtis Bay. The pier will cost approximately $1,500,000. It will have the most modern unloading machinery, so that all chutes can be used on one vessel or separately, with a shuttle and belt arrangement to prevent breakage. The capacity of the pier will be from 3,000 to 6,000 tons per hour according to the necessity for rapid loading.

Richmond, Mo.—The Pickering Coal Co. is arranging with the General Electric Co. for a motor generator set and a storage battery locomotive for use in its mine. This is said to be the first use of electricity for traction in the smaller mines of the district. The locomotive is of four tons capacity, equipped with iron-clad batteries of 300 ampere-hours capacity, from the Electric Storage Battery Co. of Philadelphia. Current will be bought from the local central station at Richmond, half a mile away, a line being extended for that purpose by the station. The line will carry alternating current, which will operate the generator set, producing direct current for the storage batteries.

Richmond, Va.—Affirming the decision of the District Court at Phillippi, W. Va., the United States Circuit Court of Appeals has decided that the Elk Coal Co. is entitled to possession of a tract of 1,000 acres in Randolph County, W. Va. This title was contested by George W. Snyder and others.

Youngstown, Ohio—The new byproduct coke oven plant, or addition to the plant, consisting of 75 ovens, being erected by the Republic Iron & Steel Co., will be completed about Nov. 1.

Coalwood, W. Va.—The Carter Coal Co. has authorized the Roberts & Schaefer Co. of Chicago to proceed with the building of a large Marcus patent coal tipple with "R. and S." loading booms, which was contracted for some months ago for the new mine recently sunk at Coalwood, and known as the Olga mine. This will be one of the largest installations in the state. The firm has also given the Roberts & Schaefer Co. a contract for a new wooden Marcus tipple for the Nora mine at Coalwood, W. Va.

Philadelphia, Penn.—On Oct. 1 the Goulds Manufacturing Co. of Seneca Falls, N. Y., will open a Philadelphia office at 111 N. Third St. It purchased the business of H. E. Trotman, who up to the present time has been distributor for Goulds pumps in this territory, and has leased from him the storeroom and warehouse at the above address. E. S. Jenison, formerly with the Canadian Fairbanks-Morse Co., Ltd., Montreal, has been appointed manager and F. G. Kramer, formerly in the employ of H. E. Trotman, will be assistant manager. J. B. Trotman will continue with the Goulds Manufacturing Co.

Louisville, Ky.—The Louisville & Nashville R.R. Co. has announced forthcoming changes in the operation of certain of its lines in central and eastern Kentucky, which are of much importance to the coal operators in the Jenkins section. The changes will be effective Oct. 1. They will include consolidation of the old Louisville & Atlantic division from Frankfort to Beattyville Junction with the eastern end of the Lexington & Eastern division, from Maloney to Jenkins, a distance of about 240 miles. This will form one of the longest divisions of the L. & N. in the state. The section of the L. & E. from Lexington to Maloney will be joined with the Kentucky Central division and directed from the office at Paris. The general offices which have been located at Lexington will be abolished and the force divided between Paris and Irvine. The proposed changes will call for new train schedules on all the lines involved and these will be put into effect shortly.

Uniontown, Penn.—Fayette County coke to England is the latest word in export circles, and although the tonnage being shipped from the ports of Baltimore and Philadelphia at present is not as large as that to some of the other countries, the way has been blazed for future orders it is believed and a steady stream of trade to the British Isles, at least during the European hostilities, is looked for. The word of a prominent coke producer is that although the Connellsville operators sell to the exporters on the Atlantic Coast, they would rather see their product go to some country that is not engaged in the European war, and instead of being emergency suppliers, lay the foundations for a healthy export trade. South America does not use much standard coke, but the tonnage of coal and coke to points south has materially increased during the past two months and before the winter is over a line of trade should have been established between here and Argentina, Chile, Bolivia and other countries of South America that should have lasting results.

Uniontown, Penn.—With coke bringing $2.25 a ton, numerous independent plants throughout the Connellsville-Klondike region are making plans to reach a maximum output by Oct. 1. The Aetna Connellsville Coke Co., which has 70 ovens burning at present, will increase its production gradually until the entire plant is working at capacity. Thompson-Connellsville No. 1 is working full with all of its 400 ovens fired and 450 men employed. Sometime between Sept. 20 and Oct. 1, 200 of the 400 ovens at Thompson-Connellsville No. 2 plant will be fired. At present a large force of men is engaged in cleaning up the plant in anticipation of a resumption. Three hundred ovens are in operation at Tower Hill No. 1 and between 100 and 150 of the 400 at No. 2 plant will be fired shortly. This company is aiming to reach a maximum output as soon as possible. The Waltersburg Coal & Coke Co. is advertising for men preparatory to resuming operations and firing 150 additional ovens. It is not known when the increase in production will become effective but it is said the company expects to have work for 150 to 175 men by the first of October.

Coal Trade Reviews

General Review

Hot weather causes a collapse in the anthracite market. Bituminous continues to improve slowly. Shortage of vessels causes a heavy slump in exports. Car and labor supply becoming important factors.

Anthracite—There has been a general collapse in the hard coal trade as a result of the unprecedented high temperatures. Dealers are slashing prices in an endeavor to force business, and the situation is fully as adverse as any time during the summer. Ordinarily the anthracite business begins to tone up at about this time, and it is most unusual to encounter a purely weather market at this period. The one encouraging factor in the situation is the fact that there is sure to be a sharp rush for coal with the first appearance of lower temperatures. At the moment stove coal is the only grade commanding the full circular price, with egg next, and fairly well maintained at close to the company prices. Pea and chestnut are at a complete standstill and the steam grades are weak, though showing indications of doing better.

Bituminous—The soft coal trade continues its quiet course toward better conditions, the improvement being slow but satisfactory. No important price recessions are noted as a result of the extremely hot weather, the general tendency being to mark time pending further developments. Occasional orders are even appearing without solicitation, which indicates that the small manufacturers are beginning to resume operations. While the coal car supply has so far continued adequate, reports of occasional shortages in isolated districts are creating no little concern over the future outlook. On the better grade fuels the demand is active, with prices firm.

Exports—The foreign trade has been greatly handicapped during the past week by the scarcity of vessel tonnage. As a result, the movement has shown a sharp decline, while accumulations at the loading piers are excessive, particularly at Hampton Roads, where a large tonnage is awaiting arrival of vessels. The movement out of Baltimore for the current week has been the lightest for a number of months, and the present indications are that the September dumping at Hampton Roads will be somewhat less than for last month. Vessel rates are stiffer, due in part to the beginning of the grain movement, and a continuation of the high freights and a paucity of vessels will restrict the offshore movement to a substantially less volume than has been anticipated.

Lake Markets—Hot and unseasonable weather does not often affect the bituminous trade appreciably, but the temperatures have been so extremely high that there has been a sympathetic relapse in this branch, together with the anthracite market. However, the delayed buying, resulting from the present temporary apathy, will ultimately result in an even greater activity with the advent of more seasonable temperature conditions. In the meantime prices are relatively steady at figures slightly above the low summer level, the railroad consumption continues to increase, and the requirements of the iron and steel industry in the Pittsburgh district remain at the maximum rate. While no important shortage of cars is yet apparent, the situation in this respect is notably different from a few months ago. A congestion of grain is reported in the West and the railroads are rushing all available equipment in that direction.

Middle West—The domestic market has been well sustained, notwithstanding the excessively hot weather. Temperature conditions have been more favorable toward the Northwest, which, combined with the advance in freight rates effective Oct. 1, has shaken out quite a number of unexpected orders. A satisfactory volume of orders is coming in from the country dealers. The car-supply question is steadily becoming a more important factor in the situation ,especially where operators are particular regarding the kind of equipment; increased tonnage, the heavy grain movement and a shortage of motive power are the chief difficulties.

A Year Ago—Heavy demand for anthracite continues unabated. Bituminous slowed down still further and the outlook is now most discouraging. Lake shipments for the season show a big loss. Middle Western steam fuel given away for freight charges.

BUSINESS OPINIONS

Iron Age—Export business is more distinctly the dominant factor in the steel trade than in any previous month of the war. Foreign rather than domestic demand caused an advance of $2 a ton in wire products on Saturday, and in the past week the inquiry for steel rounds and for billets and blooms from Canadian makers of munitions and from France has been on a scale well-nigh incredible. As a whole the market is moving upward, not uniformly nor yet with any spectacular developments, but in response to the special influences that have produced a scarcity of steel.

American Wool and Cotton Reporter—The last week has been quiet but firm. It would seem as if manufacturers were pretty well supplied with wools, and are working on what they have before they make new purchases. Considerable comment is made in regard to the method England is employing in retaining wools which have already been bid on and paid for by American purchasers. The woolen goods market is generally in a favorable condition. War orders have been more profitable than expected. They have kept looms in operation which otherwise would have been idle, and have kept up prices of domestic goods.

Financial Chronicle—Contracts arranged for building operations in 159 cities of the United States during August totaled $70,333,787, as compared with $64,039,053 during the same month of last year. The figures for the first eight months of the current year are the smallest for any year since 1908, the approximate figures for the past three years being $536 million for the current year, $584 million last year and $666 million in 1912, this latter being the high record for this period.

Bradstreet—The week's reports spell progress in agriculture, finance, trade and industry. Much-needed warm weather has given an impetus to the maturing of the large corn crop, winter-wheat threshing has been facilitated, spring wheat has begun to pour into the markets, and export trade in grain and cotton has expanded. In financial lines, while prices for securities continue to mark time, the pushing of negotiations for a large foreign loan here have righted the foreign exchange market and stiffened prices of farm products, the export of wheat and cotton being thereby facilitated. Despite excessive heat which tends to hold back retail demand for fall, jobbing trade shows expansion at most centers.

Dun—Oppressive heat checked trade activities in numerous directions, but this is a temporary drawback and is more than offset by the benefit accruing to the maturing crops. For the present, cross-currents appear in commercial channels, with the diplomatic complications continuing to cause hesitancy in forward undertakings. Hence, there is less of the anticipatory buying that usually follows the assurance of bountiful harvests, but general trade has made a substantial recovery from the previous depression and the fundamental situation is so sound that a permanent check to the advance is unlikely.

Marshall Field & Co.—Current wholesale shipments of dry goods show some increase over the corresponding week a year ago, and sales are about even with those of the same period. Fewer merchants have visited the market, and collections are slightly below normal. The staple domestics cotton goods market is firm. The warm weather is giving retailers an opportunity to clean up their stocks of summer goods, but it is delaying the distribution of fall merchandise.

The Southern Lumberman—Fall business in yellow pine is opening up slowly but steadily. Southern mills with stocks well within the probable range of demand are holding up prices and announcing occasional advances on items on which they find stocks getting short. Western retail dealers continue to buy in small lots. Domestic demand for hardwood lumber continues to increase as the fall season advances. No radical changes in the market are detected from week to week.

ATLANTIC SEABOARD

BOSTON

The weather unfavorable to a firm market, but no change in prices. Competition from fuel oil begins to rouse interest. Georges Creek and Pennsylvania grades unchanged. Freights easy and anthracite demand subject to the weather.

Bituminous—The extremely hot weather was not favorable to any strengthening of the market. No recession in prices has been noticed, however, and generally Pocahontas and New River have marked time. The only spot business offering coastwise is for out of the way points and in such cases the transportation people are asking such rates as compared with those from Philadelphia that buyers are not much encouraged to take Southern coal. The export demand continues steady and gives every sign of being the mainstay of the market the rest of the season. More coal could be shipped off-shore were there more steamers to be had.

Shippers feel that with more seasonable weather there will be renewed interest in f.o.b. coal and that requisitions on contracts will improve in volume as fall comes on. At New England distributing points coal is in ample supply and prices correspondingly low. In fact, sales have been made within a week at as low a level as at any time this year.

There is a good deal of interest, especially in Portland and Providence, over the efforts of one of the large oil distributors to shift manufacturing plants from coal. The International Paper Co. is now being changed over to use oil at several of its plants; this concern uses 100,000 tons of bituminous a year at the plants in question so the matter is one of vital interest.

Georges Creek shows no material change. Shipments on contracts are coming through with regularity but shippers of this grade have the same difficulty as others in stirring up any buying interest in spot coal. Prices are held with all the firmness so characteristic of the Georges Creek operators.

The shippers of Pennsylvania grades are doing only hand-to-mouth business. The miners of the better coals have an amount of contract business that keeps them running on part time, but the general demand will have to improve materially before the market will receive any impetus. Prices for spot coal are still at the season's minimum, with only small advances for winter delivery. All-rail the market is sluggish, most consumers being stocked to capacity.

Water Freights continue about as last quoted; 75c.@80c. is asked for tonnage from Norfolk and Newport News to Boston. Rates from New York to Providence are slightly firmer, due to the protracted fog and slow movement of boats; $1 is the rate quoted from Hampton Roads to Bangor, Me.

Anthracite—Retail trade slacked off with the summer temperatures and wholesale inquiry has been light in consequence. The shipping companies are, however, fairly well supplied with orders. Broken is about the only domestic size that is at all short with any of the companies.

The market is quotable on the following basis per long ton:

	Philadelphia*	New York*	Baltimore*	F.o.b. Mines
Clearfields	$2.15@2.65	$2.45@2.95	....	$0.90@1.40
Cambrias and Somersets	2.40@2.90	2.70@3.20	....	1.15@1.65
Georges Creek	2.92@3.02	3.22@3.32	$2.85@2.95	1.67@1.77
Pocahontas and New River	....	....	2.80@2.85	....

* F.o.b. loading ports.

Pocahontas and New River prices on cars at Boston are $3.55@3.73 and at Providence $3.50@3.68.

NEW YORK

Unseasonable weather retards anthracite trade. Coal handlers strike causing delay in shipments. Mines working better. Bituminous shippers encouraged. Labor situation becomes serious. Export situation good.

Anthracite—Weather conditions continue to check the anthracite coal industry. In addition the market has felt the effects of the coal handlers strikes, although this was of short duration. Unseasonable temperatures of the past ten days have played havoc with the market. Demand at Tidewater has not increased and prices on individual prepared coals continue 25 to 35c. off the circular. The loading piers hold sufficient coal to satisfy present requirements, but the surplus on hand is not great.

The mines are working better than for many weeks and the surplus tonnage is being sent to the stock piles. Indications are that the operators are preparing for a long suspension in the spring. Reports of the line trade from the West and South are encouraging, and demand from Northern points show signs of becoming stronger. This is especially true of the New England States where comparatively little winter supply has been accumulated. Considerable hard coal is being shipped by vessel to Canada, Custom House reports showing shipments during the past several weeks of 52,870 gross tons.

Little change has taken place in the steam-coal situation. Barley and rice coals are short with most shippers and there is a better call for pea and No. 1 buckwheat.

Current quotations on anthracite, gross tons, f.o.b. at Tidewater, are:

	Lower Ports		Upper Ports	
	Circular	Individual	Circular	Individual
Broken	$5.05		$5.10	
Egg	5.30	$4.80@5.30	5.35	$4.90@5.35
Stove	5.30	4.80@5.30	5.35	4.90@5.35
Chestnut	5.55	5.00@5.55	5.60	5.10@5.60
Pea	3.50	3.25@3.50	3.55	3.50@3.55
Buckwheat	2.75	2.25@2.75	2.80	2.25@2.80
Rice	2.25	1.75@2.25	2.30	2.00@2.30
Barley	1.75	1.45@1.75	1.80	1.75@1.80

Bituminous—A better feeling exists in the bituminous coal market. The labor question is assuming serious proportions and is likely to cause much trouble when it is necessary to increase production. The railroads continue to take large tonnages for storage purposes, in anticipation of labor troubles in the spring, when the working agreements in both the bituminous and anthracite regions expire. This increased demand has caused some of the favored operators to go on better working schedules.

There is a feeling of confidence in the export situation. Vessels remain scarce and carrying charges are stiff while many new inquiries are being received and reports of prospective orders are numerous. The demand for coke is also occupying a prominent position in the export trade.

Current quotations per gross ton at tidewater, f.o.b. are:

	South Amboy	Port Reading	St. George	Mine Price
Georges Creek Big Vein	$3.20@3.30	$3.20@3.30	$3.20@3.30	$1.75@1.85

PHILADELPHIA

Continuation of heat wave unsettles the anthracite market badly. Stove coal most active. Chestnut and pea badly off circular. Buckwheat fair but other steam sizes dull. Quite an improvement continues in bituminous, with prospect of better prices. Export trade good.

Anthracite—With the temperature reaching 90° or over for seven consecutive days the coal business has suffered an utter collapse. Ordinarily when mid-September arrives things begin to move with some briskness, but as a result of the extraordinary weather conditions the trade has been as dull as the worst week in July or August. Of course this means restricted mining and several of the big companies have already made announcements to this effect. On the other hand coal is sure to go out with a rush the moment the first seasonable weather arrives which must be soon. It is also noted that dealers who supply the steam trade are enjoying good business and it seems to be picking up right along.

A number of dealers in domestic coals, in their anxiety for business, have cut retail prices so badly that the effort to get what little business there is has practically resulted in a scramble. There have been advertisements quoting prices on pea coal which is now almost exclusively a family coal, delivered in the cellars at from $4.50 to $5.25. As it now stands many dealers are apparently going to give the public the margin they saved this summer in buying.

Of the several sizes, the most active in the wholesale market is stove coal and there is no reason to doubt that this size is bringing anything but the full circular price. Next in demand is egg with the full price fairly well maintained, although there is an occasional exception here and there, with sales made without tax or from 5 to 10c. off. Chestnut continues weak as usual, with large quantities being stored and what is sold generally sacrificed. Pea coal, which had a good start during the last few days of August and first days of September, is at a standstill, due to the fact that most dealers are holding up their orders. Sales of the finer grades have been made at $1.85 and in a very few instances at $2 and the tax, but absolutely nothing higher. An occasional instance has been noted where this grade was offered at $1.65, but certainly not the first-class article.

The steam sizes, buckwheat, rice and barley, with the exception of the first named, are not moving very well. However, buckwheat seems in fair demand and with prospects of doing still better, as the mills in this district are going on full time. The other two sizes are being heavily stored.

The circular prices, to which the Pennsylvania State tax of 2½% per ton should be added, are as follows:

	Line	Tide		Line	Tide
Broken	$3.50	$4.75	Pea	$2.50	$3.25
Egg	3.75	5.00	Buckwheat	1.25	2.25
Stove	4.00	5.00	Rice	.85	1.75
Chestnut	4.15	5.25	Barley	.50	1.50

Bituminous—The trade continues its quiet trend toward improvement. The gain is slow to be sure, but none the less satisfactory. Wholesale offices are receiving orders now and then without solicitation, which shows that the small manufacturer is getting under way in response to the generally improved business conditions. The car supply continues generally satisfactory and the cause for anxiety at the moment seems to be in the labor supply, although time may show that even this is perhaps somewhat exaggerated. The export business continues even more active, shipments and inquiries both being in good volume. Vessel tonnage remains scarce, with the prospect of continuing so for an indefinite period. Freights, too, are closely held.

There has been no appreciable change in prices during the week and while the list below is a fair basis, there is no doubt that a change all along the line in imminent:

Georges Creek Big Vein	$1.65@1.75	Fairmont gas, ¾	$1.20@1.30
South Fork Miller Vein	1.50@1.60	Fairmont gas, mine-run	1.05@1.15
Clearfield (ordinary)	1.00@1.20	Fairmont gas, slack	.70@ .80
Somerset (ordinary)	1.00@1.15	Fairmont lump, ordinary	.90@1.00
West Va. Freeport	.85@ .95	Fairmont mine-run	.85@ .90
		Fairmont slack	.60@ .70

BALTIMORE

Export movement hampered by lack of vessels. Scarcity of cars in Fairmont and Somerset regions. Market for bituminous steady.

The export movement has fallen off sharply due to lack of vessels. Only eight vessels were loaded here for foreign account last week, and only five charters were announced. During the week ending Sept. 18 only 19,981 tons was loaded here for foreign account, the smallest amount for some months past.

Car scarcity was felt severely last week in both the Fairmont and Somerset districts. The Somerset region reported about a three-fourths of requirements while the Fairmont region did not have more than a two-thirds supply. The market on bituminous grades is firm and some of the better qualities show slight increases in price.

The anthracite trade here is only fair. There is much talk from dealer to consumer about possible strike troubles in the spring, but as yet this bears but little fruit. Cooler weather has arrived and strengthened the market.

HAMPTON ROADS

Weeks shipments fair. Government takes some coal by collier. Prices remain unchanged. September movement light.

While the dumpings over the Tidewater piers may not have been as heavy as expected, they have shown up fair. Export shipments have moved principally to Italian and South American ports. Italy has taken the largest amount going to any one country. The shipments to South America have been divided among the various countries with the largest quantities going to Brazil and Argentine Republic.

Prices on all grades remain practically unchanged although there is a fairly large accumulation of coal at Tidewater. The large amount on hand is no doubt due to the fact that there are a number of vessels due whose cargoes have already arrived.

From the present outlook the indications are that the total movement from Hampton Roads for the month of September will hardly come up to August unless vessel tonnage should arrive faster than it has.

Railroad Tonnages—Dumpings over the local piers for the past five weeks compare as follows:

	Week Ending				
Railroad	Aug. 21	Aug. 28	Sept. 4	Sept. 11	Sept. 18
Norfolk & Western	172,546	211,699	232,394	156,459	182,047
Chesapeake & Ohio	129,826	103,472	82,485	93,260	87,680
Virginian	77,136	82,131	72,302	70,855	59,597
Totals	379,508	397,302	387,182	320,574	329,336

OCEAN FREIGHTS

The freight market is firmer than a week ago, owing to the absorption of steamers for the grain trade, and the amount of available tonnage has also decreased. A number of steamers were chartered during the past week at $7.92@8.04 on coal to Lower Plate ports, but these fixtures were undoubtedly at less than the market. It is reported today that a steamer has been closed at $10.44 to West Italy, which is a little higher than recent charters for this destination. West Indian and Cuban rates are also firmer. We would quote freight rates **on coal** by steamer as follows:

To	Rate	To	Rate
Havana	$2.50@2.75	Bermuda	**$3.00**
Cardenas or Sagua	2.75@3.50	**Vera Cruz**	3.50@3.75
Cienfuegos	3.25@3.50	Tampico	3.50@3.75
Port au Spain, **Trinidad**	**3.75**	Rio	8.16
St. Lucia	3.50@3.75	Santos	8.16@8.40
St. Thomas	3.00@3.25	Montevideo	8.04@8.16
Barbados	**3.75**	Buenos Aires or **La Plata**	**8.16**
Kingston	2.75@3.25	Rosario	**8.40**
Curacao	3.25	**West Coast of Italy**	10.32@10.56
Santiago	2.75@3.25	Barcelona	9.60@ 9.84
Guantanamo	2.75@3.25	**Valparaiso or Callao**	7.25@ 7.50
Demerara	5.00@5.50	Marseilles	9.84@10.08

Note—Rates noted in **bold face** type are only approximate.

LAKE MARKETS

PITTSBURGH

Unseasonably hot weather disappearing. Demand improved. Prices firmer. Operations at close to 70 per cent. Occasional slight car shortages.

The apathy in the retail coal trade as a result of the recent unseasonably hot weather is likely to yield to a condition of greater activity as the season advances. The consumption of domestic coal is, of course, still at the summer rate but more buying by retail dealers is expected. The iron and steel industry continues to operate at full capacity and as the weather improves tonnage outputs are increasing, involving the use of somewhat more coal. The railroad consumption also continues to increase.

The general tendency in coal prices is toward a greater stiffness and on occasional lots of Lake coal sold in the past few days better prices have been obtained than early in the season. The Lake movement, however, while heavier, is still confined almost entirely to operations by shippers who have their regular contracts, or mines of their own.

Occasional shortages of cars are now being reported by some of the mines. There have been no serious shortages but conditions are noticeably different from those of a couple of months ago, when there were ample supplies on all divisions.

Mining operations in the Pittsburgh district are now at close to 70% of capacity. Prices for free coal are strictly held at the following figures as minimum: Slack, 50@60c.; nut and slack, 90@95c.; nut, 95c.@$1; mine-run, $1.05; ¾-in., $1.15; 1¼-in., $1.25, per net ton at mine, Pittsburgh district. On contract to Apr. 1 the market is firm at 85@95c. for slack, $1.15@1.20 for mine-run, $1.25@1.30 for ¾-in. and $1.35@1.40 for 1¼-in.

BUFFALO

Bituminous trade suffers from the hot weather. No further improvement looked for till the temperature is lower. Anthracite dull. Lake shipments light.

Bituminous—There will not be much business till the effects of the hot weather over the first half of the month are overcome. There is scarcely a shipper who does not report the market flat for the time being. It is not likely that there will be a permanent slump, but there will will be no snap until colder weather appears. Prices are 5 or 10c. higher than they were in midsummer, which means something when they have been at the bottom so long.

There is quite an increase in mining, but the outlook is not good for any further increase till the real autumn weather sets in. It is quite possible that it may be close to November before the market resumes a stable firmness. Quotations on bituminous are weaker on the basis of $2.65 for best Pittsburgh lump, $2.50 for three-quarter, $2.49 for mine-run and $2.05 for slack. Allegheny Valley sizes are still about 25c. lower than Pittsburgh. All slack coal is about on a par and much stronger than formerly.

Anthracite—The market continues quiet. It was expected that there would be a healthy demand early this month, but this has not been realized. The fall trade will no doubt go over to October, unless there is some steady cool weather soon. The city trade is about as slack as at any time during the summer. The rail line trade is not heavy yet and Lake shipments for the week were only 85,000 tons. There are reports that Western consumers are buying coal as they bring in their grain, but the effect has not yet been noticed here to any extent.

COLUMBUS

Brisk demand for domestic sizes continues. Steam business also active and price lists well maintained. Mining operations show a decided increase.

The coal trade has been showing improvement all along the line. Domestic buying is brisk, despite the continued warm weather, and dealers are placing orders for immediate shipment.

Retail trade is active both in the city and rural sections. Farmers are now hauling their winter's supply of fuel, while householders in the cities and towns are also laying in their supplies and there is considerable school contracting going on. Public institutions are in the market for their coal supply and there is a generally healthier tone to the trade. Retail prices are well maintained and there is considerable talk of an advance about Oct. 1.

Steam business is rather active as manufacturing continues to improve. Railroads are taking more fuel for their freight movement and in addition are storing up large quantities against possible emergencies. Contracting is not active at this time as few contracts are expiring. There is not much demurrage coal offered on the local market. Steam prices are much firmer than formerly with the exception of the small sizes which are weaker.

Lake trade is still quite active and a considerable tonnage is being shipped to the Northwest. The dock situation at the upper Lake ports has improved. The Toledo docks of the Hocking Valley loaded approximately 73,000 tons during the past week.

In retail circles there is a good demand for Pocahontas and West Virginia splints. White ash is also moving well. Anthracite is in better demand than ever in central Ohio territory. The coke market is becoming firmer as the season advances.

Prices in Ohio fields are as follows:

	Hocking	Pomeroy	Eastern Ohio	Kanawha
Re-screened lump	$1.50	$1.50		
Inch and a quarter	1.40	1.40	$1.30	$1.30
Three-quarter inch	1.25	1.25		1.25
Nut	1.15	1.25		1.15
Mine-run	1.05	1.10	1.00	1.05
Nut, pea and slack	.60	.65	.50	.60
Coarse slack	.50	.55	.40	.50

Mines have been working at about the following percentages of full capacity:

District	Week Ended				District	Week Ended			
	Aug. 28	Sept. 4	Sept. 11	Sept. 18		Aug. 28	Sept. 4	Sept. 11	Sept. 18
Hocking	35	45	40	45	Cambridge	35	40	44	45
Jackson	20	20	25	25	Massillon	50	40	40	45
Pomeroy	45	50	50	60	Eastern O.	55	60	60	70
Crooksville	30	35	35	40					
					Average	34	41	42	47

CLEVELAND

The market is stronger at the prevailing prices, but no advances have been reported this week. Lake shipments heavy.

There is a marked strength in the trade, due very largely to the higher prices being asked by some operators. Quotations are being made by a number of operators, although others have apparently withdrawn from the market, as they are quoting prices beyond the reach of the local jobbers. Shipments in the Lake trade are larger, but the local market is barely holding its own. This puts the jobbers in a rather difficult position. Until all operators quote higher prices the market here is not likely to change. It was assumed that a revival of Lake business would increase the supply of fine coal and prices would suffer, but this has not been the case, as fine coal is verging on an advance of 5c. per ton.

Lake shipments are as large as operators are able to make. The all-rail demand is holding the Lake movement back and probably will until well into next month. As it is the operators and shippers who have contracts are having some difficulty in arranging for vessels. Grain rates are the highest they have been in years and vessel managers are declining coal cargoes in order to save time and late shipments of coal will cost the shippers heavily, as one-trip grain profits are equal to three or four trips with ore and coal.

Jobbers are buying at the following prices:

	Pocahontas	Youghiogheny	Fairmont	Bergholz	Ohio No. 8
Lump	$3.70			$2.30	
Lump, 6-in.				2.30	
Lump, 1¼-in.		$2.25		2.10	$2.15
Lump, ¾-in.		2.15@2.20	$2.00	2.00	1.95@2.00
Egg	3.70			1.95	
Mine run	2.70	2.10@2.15	1.90	1.85	1.85
Slack		1.65	1.65	1.55	1.60

DETROIT

Steam coal orders continue in good volume. Midsummer temperature slows down the domestic market. Lake movement meets new check.

Bituminous—Encouraging features are still developing in the local steam trade and business appears to be gradually expanding under a strengthening demand from consumers. Orders continue of small size, but the buying is regular. Some consumers are still obtaining coal on contracts made some time ago at prices materially below list quotations, and this is a retarding influence in growth of business.

Anthracite—Weather conditions have also placed a check on the anthracite business. Yards that were keeping a considerable force busy a week ago are now handling little business and orders to shipper are also less numerous.

Lake Trade—Lake shipments are not materially increased but the improvement in movement of other commodities is causing some vessel owners to reject coal cargoes, believing they can save sufficient time by going up light to more than compensate for the loss of freight on coal. It is quite probable all-rail shipments this season will be larger than usual.

TOLEDO

Toledo facing a car shortage. Coal movement light and no raise in anthracite the first of the month.

The one new feature of the coal situation here is the possibility of a car shortage. The Baltimore & Ohio has its agents canvassing the main line of the road in an effort to get freight cars unloaded and into Chicago at the earliest possible moment. It is stated that there is considerable grain congestion and the cars are needed there. The Pennsylvania has drawn all its surplus equipment into use and officers declare that freight traffic is extremely heavy. The New York Central has especially good equipment here, but its surplus stock is being reduced rapidly.

There was no increase in anthracite prices the first of September as is usually the case and chestnut coal is retailing at $7.85, with stove and egg at $7.60 per ton. The Lake movement is not heavy for this season of the year. A few contracts are occasionally made but they are for the most part small orders.

CINCINNATI

Warm weather has caused a let-up in domestic business. Better prices are promised, however, and prospects for improvement in the steam market are good.

The warmest weather of the summer has caused a sharp relapse in the growing domestic demand, which was not sufficiently strong to stand any setback. Prospects of an early fall forced some dealers into the market for larger stocks some time ago but the weather has caused a relapse into the waiting attitude. Price concessions, however, seem now to be confined to a comparatively few concerns. While the steam demand has not improved much, the relatively small production of nut and slack caused by the let-up in the domestic market has helped the steam grades considerably, resulting in a stiffening of prices. With indications of a car shortage it is predicted that the coal market is going to be a good deal stronger.

LOUISVILLE

Advancing season starting the coal moving in spite of the unseasonable weather.

With the season rapidly advancing to the point where retailers must lay in stocks, the movement in the Kentucky field is steadily increasing. Block sizes are in best demand, particularly for domestic purposes. Prices are showing some tendency to stiffen, though under the influence of the recent hot weather the edge has been taken off the market. A general improvement in business is forecasted. Jellico coals are selling about as follows, f.o.b. mines: Block, $1.65@1.75; block and lump, $1.55@1.65; round, $1.30@1.35; straight run-of-mines, $1.10@1.15; 6-in. run-of-mines, $1; nut and slack, 25@65c., according to character and quality. Some of the fancy coals exceed these prices largely while lower grades are correspondingly lower.

COKE

CONNELLSVILLE

Furnace coke contracting slow but buyers and sellers may soon get together. Prompt furnace coke stronger. Production and shipments heavier.

Apart from the few furnace-coke contracts recently made, buyers and sellers are finding difficulty in getting together, and there is no definite basis yet established for first-half contracts. A definite contracting movement, however, is believed to be not far off, as furnacemen are likely to be found ready to contract whenever they see that a definite trading market has been established. The early negotiations, as already reported, ran exclusively to sliding-scale contracts, based on pig-iron prices, but it has been difficult to arrive at a schedule which would be generally satisfactory and it now seems a distinct possibility that buyers and sellers will get together on a flat price after all.

In such an event the settling basis would probably be between $2.25 and $2.50. Recent contracts made include one for the whole of next year, based on $1.75 for coke if Eastern foundry pig iron is $14.50, with one-fifth as much advance for coke as for pig iron. Another contract was made, with a valley furnace not now in blast, for coke at $1.75 minimum on $12.75 basic iron and one-fifth as much advance in coke as in pig iron. This is a higher price basis than would have been done if the furnace were in operation and certain to continue. For deliveries late in the year sales have been made both at $2 and at $2.25.

Prompt furnace coke has stiffened slightly, the minimum of present offerings being $1.65. We quote: Prompt furnace, $1.65@1.70; furnace to Jan. 1, $2@2.25; prompt foundry, $2.30@2.60; contract foundry, $2.40@2.60, per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Sept. 11 at 387,703 tons, an increase of 7,768 tons, and shipments at 388,862 tons, an increase of 8,231 tons.

Buffalo—The demand is good, though there is complaint that too many ovens have been started up. The oven capacity exceeds all possible consumption. The only time when the ovens would all be needed would be when consumers were buying more than they required for present use. Prices are somewhat weaker on the basis of $4.30 for best 72-hr. Connellsville foundry and $3.35 for stock coke.

Chicago—Coke is still buoyant. Quotations for future delivery indicate that sellers are looking forward to brisk demand with higher prices. All grades are active at the following prices: Byproduct foundry, $4.90@5.10; byproduct domestic, $4.75; Connellsville, $4.85@5; Wise County, $4.75@5; gas coke, $3.85@4.

MIDDLE WESTERN

GENERAL REVIEW

Warm weather slows up buying of domestic sizes. Smokeless grades dull. Screenings weaker. Anthracite moving in larger volume.

Notwithstanding the hot weather which has slowed up the demand for domestic coals, prices are generally well maintained. Orders for domestic sizes are still being received from the country in fair volume. Most Illinois and Indiana mines are oversold on domestic lump but some of the operations are long on egg and nut sizes, which are being sacrificed at low prices to move surplus accumulations at the mines.

Lack of car supply is becoming more pronounced. Small gondola cars are hard to obtain, and a number of mines have lately been obliged to shut down for a full shift until empties could be supplied. The railroads are having more or less trouble in handling both grain and coal which are now simultaneously moving to the markets. Delays are said to be due more to shortage of motive power than to lack of cars.

Screenings are now somewhat stronger but have suffered a decline of from 5c. to 10c. per ton from prices prevailing during the previous week; but even at present figures they are selling at double the prices received at the same time last year. Production is increasing in most of the Western mining districts. In Illinois it is estimated that the output is at 75% of normal and in Indiana 60%. It is difficult to estimate for Kentucky production on account of so many new operations but the output there is about 50% of normal. It is noticeable that some of the larger industrial plants are commencing to buy coal for storage purposes which is not expected to be used until after Apr. 1 . This, with the absorption of storage coal by the railroads, the approach of colder weather, and the shortage of cars and labor, and delayed movement on the part of railroads, makes the operator feel optimistic.

CHICAGO

Shipments to Northwest heavier. Indiana grades in better demand. Smokeless weak, while Hocking grades are stiffer and Kentucky coals are fluctuating over a wide range.

The situation in Southern Illinois is satisfactory and mines are operating nearly to capacity. In Franklin County domestic sizes are in strong demand; in Williamson County, while $1.75 is being received for the better known coals, the average price may be considered around $1.60. Screenings are easier, as well as other fine sizes, because of the increased output of domestic coal. Indications, however, point to improvement in the steam demand in this section. Shipments to Northwestern points are becoming heavier. The demand for Harrisburg steam lump during the past week has been very active, and improvement is shown in shipment of steam sizes from Saline County. Carterville lump has been very active, and egg and No. 1 washed continue steady at prices ranging from $1.60 to $1.75.

Steady buying of domestic lump has characterized the Springfield market and steam coals have also shown an improvement. Screenings are ranging from 50 to 60c., being slightly lower than last week.

Absorption of Indiana domestic coals is improving, but so far country dealers have not taken the amount received in previous years. ,Steel plants and allied industries are still backward in ordering coal. The demand for Sullivan and Green County lump has slumped somewhat, and 3d and 5th vein steam lump from the Clinton district has been very quiet. Sullivan County egg and nut are a drug on the market. Knox County steam coals are moving freely at higher prices and Clinton domestic demand is perceptibly stronger.

Smokeless lump and egg is firm at the list price of $2.25 in the country districts. Plenty of the prepared sizes seem to be on hand in Chicago, available for sale and absorption of these offerings occur at 10 and 15c. under circular figures. Pocahontas mine-run retains its strength and no free shipments are being made under $1.40. Quite a little contract mine-run has been moving at $1.25. On splint a wide range of prices still persists. Pennsylvania smokeless mine-run, lump and egg are in steady demand at about $2, while mine-run is being mainly sold at $1.25.

Stiffening in the price of Hocking domestic lump is observable. It is reported that $1.60 will be the circular price after Sept. 15.

Eastern Kentucky prices continue to cover a wide range. Millers Creek Block is in active demand at about $2.25, but other operators are not so fortunate. Screenings are plentiful and are sacrificed at low figures.

Anthracite is in fair demand. As a result of efforts of retailers to take care of their winter needs deliveries have been more rapid recently, and the market is absorbing offerings without trouble.

Quotations in the Chicago market are as follows:

	Williamson and Franklin Co.	Springfield	Sullivan	Clinton	Knox and Greene Cos.
Lump......	$1.60@1.75	$1.50@1.65	$1.50@1.60	$1.35@1.50	$1.40@1.50

ST. LOUIS

High temperatures slow down the buying. Prices holding steady except on screenings.

A belated spell of summer weather has made September seem like August and has checked the improved demand. There has been a falling off in the domestic orders which gave life to the market before the hot wave came. Householders are not worrying about getting their cellars filled for the winter.

Lump coal prices are being upheld firmly and the mines have plenty of orders on this size. Screenings have been much weaker, especially those coming from the inner group, which have been selling as low as 35 to 40c.

	Big Muddy	Frank Co.	Carterville	DuQuoin
8-in. lump..........	$2.30	....	....	....
4-in. lump..........	2.20	....	....	....
2½-in. lump..........	2.10	....	....	....
6-in. lump..........	....	$1.65@$1.75	$1.50@$1.60	$1.50

No. 1 washed.......	....	....	1.65	....
No. 2 washed.......	....	....	1.25	....
No. 3 washed.......	....	....	1.25	....
No. 4 washed.......	....	....	1.20	....
No. 5 washed.......	....	....	.70	....
Screenings..........	1.00	....	.45@ .50	.45

Prices quoted above are f.o.b. mines. The rates from mines to St. Louis are: Big Muddy, 70c.; Franklin and Williamson County, 72½c.; DuQuoin, 62½c. East St. Louis rates are 25½c. per ton less. When destined beyond St. Louis the rate to East St. Louis is 40c. per ton.

INDIANAPOLIS

General improvement in mining operations in Indiana, due mainly to the advancing season. Prices unchanged, except for some weakening of slack.

The impetus due to the fall demand is being felt though the September weather has been anything but suggestive of the need of coal. There is always some accumulation against emergencies and part of this reserve stock is now being laid in. The acceleration of mine operations has resulted in increasing the supply of screenings and there has been some weakening of prices. Sales of Nos. 5 and 6 are reported as low as 60c., but the best No. 4 still commands 90c. No. 4 mine-run sells at $1.15@1.20 f.o.b. mine and domestic lump at $1.50.

Mines have been able to increase running schedules about one-third. There is some complaint about difficulty in getting sufficient gondola cars from the Monon, Pennsylvania and Illinois Central lines. There is a seasonable movement from retail yards and prices are unchanged. Dealers have been making as many contracts as possible at $2.75 a ton for Indiana domestic lump. Operators report some improvement in railroad buying.

DULUTH

Healthy increase in the shipments of bituminous coal features the market.

Bituminous—Dock companies are kept quite busy on rush orders from country dealers and the elevator companies for threshing purposes. All the dock companies and the railroads operating lines into the grain belts of the Northwest, report a large increase in business as compared with a year ago. That the present prices are likely to remain firm, with possibly an advance in the very near future, is the feeling among all of the companies at the present time. The light shipments of this season, together with an improvement in business conditions generally are factors that are likely to create a decidedly firmer tone. Quotations to dealers are as follows:

	Yough.	Hock.	Poca.	Splint	Ky. Elk.
Lump	$3.40	$3.40	$4.75	$3.40	$3.55
Dock-run	3.10	3.05	3.25	3.10	3.25
Screenings	2.40	2.25	2.75	2.40	2.55

Anthracite—In the anthracite trade buying has begun in a healthy way but it requires the actual starting of fires to make an impression on most consumers, hence no great rush is expected until cooler weather arrives. Quotations to dealers, f.o.b. cars at docks, Duluth are as follows: Egg and stove, $6.85; nut, $7.10; pea, $5.55.

PRODUCTION AND TRANSPORTATION STATISTICS

MIDDLE WESTERN ROADS

The following is a comparative statement of the coal handled over the 17 principal Middle Western railroads for July and the first 7 months of this year, as compared with the same periods last year:

	July		7 Months	
	1914	1915	1914	1915

FOREIGN MARKETS

GREAT BRITAIN

Sept. 3—Business on the coal market is very quiet and the demand is slow, with prices in favor of buyers able to take prompt shipments. Normal quotations are as follows:

Bset Welsh steam.......	Nominal	Best Monmouthshires....	$5.76@6.00
Best seconds............	Nominal	Seconds................	5.28@5.52
Seconds................	$5.76@6.00	Best Cardiff smalls......	4.32@4.56
Best dry coals..........	5.76@6.00	Cargo smalls...........	2.64@2.88

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport, both net, exclusive of wharfage.

Freights—Inquiries are fairly numerous, but many merchants are holding off in the hope of lowering rates. Rates are approximately as follows:

Gibraltar.........	$3.96	Naples..........	$7.44	St. Vincent.......	$4.32
Marseilles........	6.65	Alexandria.......	7.80	Rio de Janeiro....	5.04
Algiers...........	5.79	Port Said........	7.80	Monte Video.....	4.80
Genoa............	7.44	Las Palmas......	4.08	River Plate......	5.04

Coal Contracts Pending

The purpose of this department is to diffuse accurate information of prospective purchases and prices with a view to affording equal opportunity to all, promoting market stability and inculcating sound business principles in the coal trade.

+Indicates contracts regarding which official information has been received.

Recast

In the following table we give a list of all old contracts coming up for consideration during the ensuing week. The table gives our contract number, the name of the purchaser, city, tonnage and page on which the detail notice appeared.

No.	Purchaser	City	State	Tonage	Page
1349	Board of Education	Ogden	Utah	1,400 b	411
1352	Security Stove Co.	Kansas City	Mo.	4[2]	411
1356	Municipal L. & W. Department	Storm Lake	Iowa		411

a Indicates anthracite coal. b Indicates bituminous. [1] Per month. [2] Carloads.

Supplemental Notes

Under this heading additional or supplemental information regarding old contracts appears, together with the page number of the original notice.

1043—Chicago, Ill.—It is understood that the L. A. Budlong Co. will not contract for their coal supply this season, but will confine their purchases to the open market as their requirements develop (p. 116). The company ordinarily uses Spot Logan splint and Red Jacket egg. Address Purchasing Agent, L. A. Budlong Co., Chicago, Ill.

+1270—Lake City, Minn.—This contract (p. 324), which provides for furnishing the Municipal Electric Light and Water Plant at this place with approximately 300 tons of coal, will not be entered into until a change in the weather conditions, the purchases being confined to the open market for the time being. The average price for Island Creek coal this year is about $3.65 as compared with $3.85 per ton f.o.b. Lake City, last year. Address Supt. M. J. Stowe, Municipal Elec. Lt. and Water Plant, Lake City, Minn.

1306—Billings, Mont.—This contract (p. 366), was last year awarded to the Kooi Coal Co. of Kooi, Wyo., but pressure is being brought to bear on members of the Board to let the contract to a Montana concern this season. The price at which the business was done last year was $2.80 per ton. Address Clk. A. J. Thorine, School Dist. No. 2, Yellowstone County, Billings, Mont.

1321—Plymouth, Ind.—Bids on this contract (p. 367), which provides for furnishing Marshall County with 280 tons of Pocahontas egg coal, will be received until Oct. 5 instead of Sept. 7 as previously announced. Address County Audr. G. F. McCoy, Plymouth, Ind.

1331—Fairpoint, Ohio—Bids have been received on this contract (p. 467), which provides for furnishing the Wheeling Township Board of Education with coal as follows: George E. Barnes, screened lump, 8c. per bu.; M. C. Huntsman, 7½c. per bu.; A. B. Conron, 7.95c. per bu.; S. S. Brokaw, 9c. per bu.; Wheeling Valley Coal Co., 7.85c. per bu. All bids were for screened lump with the exception of the last, which was for three-quarter lump. Address Clk. Addison Saffell, Bd. of Edu., Fairpoint, Ohio.

New Business

1451—New Orleans, La.—The Algiers Distilling Co. will be in the market during the early fall for their fuel requirements. Address Purchasing Agent, Algiers Distilling Co., Brooklyn Ave. and Mississippi Levee, Algiers, La.

1452—Sayreville, N. J.—The Board of Education at this place is requesting bids on 150 tons of egg and stove coal, and 25 tons of nut coal to be delivered at the various schools in the district. Address Dist. Clk. Frederick Werner, Bd. of Edu., Sayreville, N. J.

+1453—Trinidad, Colo.—The School Board of Dist. No. 1 will receive bids until Sept. 27 for furnishing approximately 700 tons of mine-run and slack coal. Address Secy. School Bd. Dist. No. 1, Trinidad, Colo.

+1454—Sharpsburg, Penn.—The Board of Education at this place will receive bids for furnishing lump and mine-run coal for the Locust Street School Building during the coming year. A previous request for bids from the Board of Education at this place was run under contract No. 1230, Vol. 8, p. 245. Address Secy. G. A. Speer, Bd. of Edu., Sharpsburg, Penn.

1455—New Orleans, La.—The Hotel De Soto will contract some time before Nov. 1 for its annual requirements of coal, amounting to about 120 tons per month. Address Gen. Mgr. Vic Le Beau, Hotel De Soto, Baronne and Poydras St., New Orleans, La.

+1456—Portsmouth, Ohio—The County Government will receive bids until noon, Oct. 11, for furnishing 5,000 bu. (80 lb. per bu.) of coal for use at the County Infirmary. The coal must run 60% lump, and deliveries are to be completed before Nov. 1 of this year. Quotations should be f.o.b. Portsmouth, Ohio. The successful bidder will be required to furnish a bond for 50% of the amount of the contract. Address County Audr. Thomas C. Patterson, Portsmouth, Ohio.

1457—Sharpsburg, Penn.—Sealed bids will be received for furnishing St. Mary's Church, School, Lyceum and Parsonage with coal as may be required. Address Rev. John Otten, 210 Penn St., Sharpsburg, Penn.

+1458—Davenport, Wash.—The Lincoln County Board of Commissioners will receive bids until 1 p.m, Oct. 5, for furnishing and delivering 50 tons of coal to the local Court House. Address Clk. J. E. Howard, Bd. of County Comrs., Davenport, Wash.

+1459—Hollidaysburg, Penn.—The Blair County Board of Directors received bids until 10 a.m., Sept. 22, for furnishing the County Home with the annual supply of coal, involving approximately 1,500 tons of bituminous. Quotations should be f.o.b. Spring Meadow siding, and deliveries are to be made as required. Address Secy. D. D. Coleman, Blair County Bd. of Comrs., Hollidaysburg, Penn.

+1460—La Moure, N. D.—The La Moure County Board of Commissioners will receive bids until 2 p.m., Oct. 5, for furnishing and delivering approximately 100 tons of Hocking Valley or Virginia splint coal to the County Court House as may be required during the ensuing year. Address County Audr. O. C. Temple, La Moure, N. D.

+1461—Albia, Iowa—The Independent School District at this place will receive bids until 5 p.m., Sept. 25, for furnishing the several buildings with coal during the coming school year. Address Secy. C. W. Smallwood, Independent School Dist., Albia, Iowa.

+1462—Wheelock, N. D.—The Adams School District No. 79 will receive bids until 6 p.m., Oct. 12, for furnishing the different school buildings with coal during the coming school year. Address Clk. R. E. Pepple, Adams School Dist. No. 79, Wheelock, N. D.

+1463—Little Falls, Minn.—The City Government will receive bids until Oct. 4 for furnishing approximately 50 tons of Youghiogheny coal, f.o.b. track at this place. A certified check for 10% of the amount of the bids must accompany each proposal. Address City Clk. Victor Schallern, Little Falls, Minn.

1464—Santiago, Chile—The Compania de Gas is in the market for 10,000 tons of American gas coal running about 40% volatile matter. The coal must produce about 60% coke and not to exceed 6% ash. Deliveries are to be at Valparaiso, and the coal will be taken in two shipments. Address Purchasing Agent, Compania de Gas, Santiago, Chile.

+1465—Selby, S. D.—Bids will be received until 2 p.m., Oct. 5, for furnishing and delivering coal in carload lots to the local Court House. Address Audr. W. E. Hoffman, Selby, S. D.

+1466—Bismarck, N. D.—Sealed bids will be received until 3 p.m., Oct. 5, for furnishing and delivering approximately 200 tons of the best lignite lump coal in the bins at the County Court House. Each bid must be accompanied by a certified check for 5% of the amount involved. Address County Audr. T. E. Flaherty, Bismarck, N. D.

+1467—Highmore, S. D.—The Hyde County Commissioners will receive bids for furnishing and delivering 75 tons of coal to the County Court House. Bids must specify the units per ton and must be accompanied by a certified check for $200. Address Audr. L. W. Carter, Hyde County, Highmore, S. D.

+1468—Wheeling, W. Va.—The Board of Education of the Triadelphia District received bids until 6 p.m., Sept. 22, for furnishing and delivering coal for about 10 different schools of the district. Some coke will also be required. Address Secy. S. S. Jacob, Jr., Bd. of Edu., Triadelphia District, Wheeling, W. Va.

+1469—Warren, Minn.—The Marshall County Board of Commissioners will receive bids until 2 p.m., Sept. 27, for furnishing and delivering 125 tons of Youghiogheny screened lump coal and 30 tons of anthracite. Address Audr. A. G. Lundgrem, Warren, Minn.

+1470—Minnewaukan, N. D.—The Benson County Board of Commissioners will receive bids until 2 p.m., Oct. 5, for furnishing and delivering 150 tons of lignite coal to the County Court House. All bids must be accompanied by a certified check for 5% of the amount bid. Address Audr. W. E. Paulson, Benson County, Minnewaukan, N. D.

+1471—Ft. Worth, Tex.—Bids will be received by the Tarrant County Orphans Home for furnishing one carload of McAlester mine-run, domestic nut, chestnut or pea and slack coal, to be delivered at the Home on the Ft. Worth-Dallas Interurban line. The bids will be received until 10 a.m., Sept. 27. Address Audr. J. A. Mulholland, Tarrant County, Ft. Worth, Tex.

+1472—Alpena, Mich.—The Board of Education will receive bids until 4:30 p.m., Oct. 15, for furnishing and delivering Pittsburgh lump coal to the city schools as required during the ensuing year. All bids must be accompanied by a guaranteed analysis. Address Alfred E. Ash, Alpena Bd. of Edu., Alpena, Mich.

+1473—Centerville, S. D.—The Independent School District No. 2 received sealed bids until 8 p.m., Sept. 24, for furnishing coal f.o.b. Centerville, S. D., deliveries to be made in September or December. About 125 tons of the best grade 6-in. Sunday Creek, Hocking Valley, Illinois, Island Creek splint or Indiana block coal are required. Address Clk. Walter M. Gardner, Independent School Dist. No. 2, Centerville, S. D.

1474—Salt Lake City, Utah—The University of Utah will receive bids until 1 p.m., Sept. 28, for furnishing 1,500 tons of screened slack coal during the coming school year. Address University of Utah, Salt Lake City, Utah.

1475—Cincinnati, Ohio—The Hamilton County Board of Commissioners will receive bids until noon, Oct. 1, for furnishing approximately 1,500 tons of Pocahontas or New River mine-run coal for the Hamilton County Infirmary at Carthage. Quotations should be on mine-run coal f.o.b. Big Four tracks at Carthage, delivery to be as required by the superintendent during the year beginning October, 1915. Bids must be on blank forms which may be obtained on application, and must be accompanied by a bond for $300. Address Clk. Albert Reinhart, County Comrs. Office, Cincinnati, Ohio.

+1476—Cedar Grove, N. J.—The Essex County Hospital will receive bids until 2 p.m., Oct. 13, for furnishing approximately 10,000 tons of coal for the year beginning Nov. 1. Specifications may be obtained on application. All bids must be accompanied by a certified check for 5% of the amount of the bid, and also a certificate testifying that the bidder has complied with certain state provisions embodied in chapter 253 of the state laws. The successful bidder will be required to furnish a surety bond of 50% of the amount of the contract. Address Supt. George C. Bergen, Pur. Dept., Room 206, Court House, Newark, N. J.

+1477—Skillman, N. J.—The New Jersey State Village for Epileptics will receive bids until 1:30 p.m., Oct. 4, for furnishing its coal requirements during the ensuing year. All bids must be accompanied by certified check for 5% of the amount of the tender, and the successful bidder will be required to furnish a bond for not less than 50% of the gross amount involved. Address Supt. David S. Weeks, M. D., Skillman, N. J.

+1478—Jamesburg, N. J.—The New Jersey State Home for Boys will receive bids until 3 p.m., Oct. 5, for furnishing its coal requirements during the year beginning Nov. 1. All tenders must be accompanied by a certified check for at least 10% of the amount of the bid, and the successful bidder will be required to furnish a satisfactory bond for at least one-half of the gross amount involved in the contract. Quotations should include delivery at Lower Jamesburg. Address Supt. John C. Kalleen, State Home for Boys, Jamesburg, N. J.

+1479—Genoa, Italy—An inquiry has been received from a large Genoa importing concern for two cargoes (about 4,000 to 5,000 tons each) of New River or Pocahontas coal for immediate shipment. Address E. G. Long Co., 50 Church St., New York City.

Contracts Awarded

Note—Successful bidders are noted in **bold face** type.

No. 1255.—Ft. Benton, Mont.—This contract (p. 323), which provides for furnishing school district No. 1 with approximately 200 tons of nut coal, has been awarded to **La Barre & Thompson** at $4 per ton, delivered in the basement of the schoolhouse. John Muir bid $4.10 per ton. The coal will be furnished from the mine of the Stainsby Latham Coal Co., Stockett, Mont. Address Clk. Ezra L. Crane, School Dist. No. 1, Ft. Benton, Mont.

No. 1257—Watertown, S. D.—This contract (p. 323), which provides for furnishing the Board of County Commissioners with approximately 90 tons of Pocahontas smokeless lump coal, has been awarded to the **Consumers Fuel & Ice Co.** at $6.75 per ton. Other bids were: Pacific Elevator Co., $7.25; Watertown Feed & Fuel Co., $7.20; Selsmer Grain & Coal Co., $7.15. Address County Audr. J. S. Johnson, Bd. of County Comrs., Watertown, S. D.

+No. 1258—St. Clairsville, Ohio—This contract (p. 199), which provides for furnishing the Belmont County Court with coal during the ensuing year, has been awarded to Fritz Relive, at $8 per 100 bu. Address County Audr. Emerson Campbell, St. Clairsville, Ohio.

1266—Wichita, Kan.—This contract (p. 324), which provides for furnishing the local Board of Commissioners with coal, has been awarded to the **Good-Hilliard Coal & Feed Co.** There were no other bidders for the business. Address County Clk., Wichita, Kan.

1268—Steele, N. D.—This contract (p. 324), which provides for furnishing Kidder County with approximately 140 tons of coal, has been awarded to **J. W. Gonsullus & Co.**, at $3.15 per ton. Address County Audr. J. C. McWhinney, Steel, N. D.

+1269—Council Bluffs, Iowa—This contract (p. 324), which provides for furnishing the locad schools with 1¼-in. lump from Montgomery County, Ill., has been awarded to the **Western Fuel Co.**, at $3.93 per ton. Other bids received on this business were: C. W. Bowyer Coal Co., $3.98; Fenlon-Wickham Coal Co., $4.07; Carbon Coal Co., $4.17. Address Secy. J. J. Hughes, Independent School Dist., Council Bluffs, Iowa.

+1271—Hastings, Neb.—This contract (p. 324), which provides for furnishing the Adams County Board of Commissioners with coal for the Court House during the year beginning Sept. 1, has been awarded to **Chris Hausen,** at $4.60 per ton for Weir City nut. J. H. Yosh Lumber Co. bid $4.72 for Weir City nut unscreened, Allyn & Bissell bid $4.64 for the same, $4.44 for mill and $4.27 for Rock Spring slack. Byers Lumber Co. bid $4.68 for Weir City nut and $4.30 for Rock Springs slack and the Hastings Fuel Co. bid $4.65 per ton for Weir City nut. Address County Clk. C. H. Hudson, Hastings, Neb.

+1279—Jamestown, N. D.—This contract (p. 324), which provides for furnishing the county government with 150 tons of deep-mined lignite coal and 20 tons of anthracite stove coal, has been awarded to the **Welles Thompson Co.,** at $8.25 for anthracite and to the **Washburn Lignite Coal Co.,** at $3.25 per ton for the lignite. Address County Audr. Andrew Blewitt, Jamestown, N. D.

+1286—Fargo, N. D.—This contract (p. 324), which provides for furnishing the Cass County Board of Commissioners with coal has been awarded to the **Good-Hillyard Coal Co.** at $4 per ton on shaft-mine bituminous lump and $3 for slack. Address H. M. Barrett, Bd. of County Comrs., Fargo, N. D.

No. 1287—Greensburg, Ind.—This contract (p. 324), which provides for furnishing the county commissioners with 75 to 100 tons of Youghiogheny coal, has been awarded to the **Garland Milling Co.** at $3.60 per ton. Address County Audr. L. W. Sans, Greensburg, Ind.

1284—Council Bluffs, Ia.—This contract (p. 324), which provides for furnishing the free public library of this city with coal during the ensuing season, has been awarded to the **Fenlon-Wickham Coal Co.** at $4.13 per ton. Address Librarian, Free Public Library, Council Bluffs, Ia.

+1288—Sioux City, Iowa—This contract (p. 325), which provides for furnishing the Public Library at this place with anthracite coal, has been awarded to the **H. E. Haakinson Co.** at $10.25 per ton. Other bids on this business were: L. G. Everist Coal Co., $10.45; Brawn Coal Co., $10.50; Barish Bros., $9.75, with $1 extra for delivery. Address Libn. Jeannette M. Drake, Pub. Lbry., Sioux City, Iowa.

+No. 1290—Ellendale, N. D.—This contract (p. 325), which provides for furnishing the Dickey County Board of Commissioners with approximately 200 tons of Youghiogheny mine-run coal, to be delivered at the court house, has been awarded to the **Ellendale Equity Co.** at $6.25 per ton. The Ellendale Grain & Produce Co. bid $6.30 per ton. Address County Audr. C. C. Misfeldt, Ellendale, N. D.

+1292—Larimore, N. D.—This contract (p. 325), which provides for furnishing the local board of education with approximately 100 tons of Youghiogheny coal has been awarded to **O. H. Phillips** at $6.80 per ton. Address Clk. F. W. Reinoehl, Bd. of Edu., Larimore, N. D.

+No. 1296—Alliance, Neb.—This contract (p. 325), which provides for furnishing the local school district with approximately 500 tons of lignite coal, has been awarded to **J. H. Vaughan & Son** at $4.30 per ton for nut and egg and $3.10 for nut and pea, both of the prices including cost of delivery. Address Secy. F. W. Harris, Alliance School Dist., Alliance, Neb.

+1305—Hubbard, Ohio—This contract (p. 366), which provides for furnishing the local Board of Education with 1¼-in. screened coal during the ensuing year, has been awarded to **J. N. Brewer & Son.** Address Clk. Clyde Smith, Bd. of Edu., Hubbard Village School Dist., Hubbard, Ohio.

+1309—Cedar Rapids, Iowa—This contract (p. 366), which provides for furnishing the City Government with coal, has been awarded as follows: **W. G. Block Co.,** 300 tons Fulton County, Illinois, lump coal, $3.36; **Russell Coal & Coke Co.,** 60 tons anthracite range coal, $9.20. Address City Clk. L. J. Storey, Cedar Rapids, Iowa.

+1310—Sidney, Ohio—This contract (p. 366), which provides for furnishing the local Water Works Department with coal during the year beginning Sept. 1, has been awarded to the **Southern Coal & Coke Co.,** Chattanooga, Tenn., at 90c. per ton for mine-run coal. Address Dir. C. B. DeWeese, Dept. of Pub. Service, Sidney, Ohio.

1312—Montevideo, Minn.—This contract (p. 367), which provides for furnishing Chippewa County with coal, has been awarded to the **Montevideo Fuel & Ice Co.** for $5.95 per ton for Youghiogheny lump coal. Address Audr. J. J. Stennes, Montevideo, Minn.

+1315—Keytesville, Mo.—This contract (p. 367), which provides for furnishing the County Court House with coal to be delivered before Nov. 1, has been awarded to **William Moore,** at 14⅜c. per bu. delivered. Address County Clk. W. W. White, Keytesville, Mo.

+1317—Hutchinson, Minn.—This contract (p. 367), which provides for furnishing the local Board of Education with 250 tons of Youghiogheny lump coal has been awarded to the **Interior Lumber Co.,** at $5.13 per ton delivered. Address Secy. Henry Braun, Bd. of Edu., Dist. No. 2, Hutchinson, Minn.

1319—Boise, Idaho—That part of this contract (p. 367) providing for furnishing the Idaho Soldier's Home with coal has been awarded to the **Union Seed & Fuel Co.** at $7.70 per ton for Utah screened lump and $7.20 for Utah screened nut coal. The portion of the contract providing for the requirements of the penitentiary is still under advisement. Address Secy. George R. Barker, Capitol Bldg., Boise, Idaho.

+1322—Brownstown, Ind.—This contract (p. 367), which provides for furnishing the Board of County Commissioners with 300 tons of Youghiogheny coal, has been awarded to **C. F. Robertson,** at $3.45 for coal over a 4-in. screen. Address County Aud. Albert Luedtke, Brownstown, Ind.

+1325—Canton, Ohio—This contract (p. 367), which provides for furnishing the Stark County Infirmary with approximately 1500 tons of coal, has been awarded to **A. F. Sonnhalter** on the following basis: Lump, $1.50; three-quarter lump coal, $1.40; mine-run, $1.25; slack, 75c. Address Board of Stark County Commissioners, Canton, Ohio.

+1326—Dalton, Ohio—This contract (pp. 367, 446), which provides for furnishing the Sugarcreek Township Board of Education with coal during the period ending Jan. 1, 1916, has been awarded to **John Caldwell,** of Dalton, Ohio, at $3.10, and **E. P. Gerber,** Kedron, Ohio, at $3.25. These are minimum prices, the exact figures ranging upward according to distance of haul. Address Clk. Clayton L. Arnould, Bd. of County Comrs., Dalton, Ohio.

+1327—New York, N. Y.—This contract (pp. 367, 446), which provides for furnishing the Panama R.R. Co. with its fuel requirements, estimated at from 500,000 to 600,000 tons of coal, has been awarded to the **Crozer-Pocahontas Co.** and **William C. Atwater & Co.,** at $2.60 per ton for Pocahontas and New River Coal. The contract becomes effective Sept. 15. Address Asst. to Vice-Pres. R. E. Rutherford, Panama R.R. Co., 24 State St., New York City.

+1331—Fairpoint, Ohio—This contract (p. 367), has been awarded to **Geo. Barnes,** of St. Clairsville, Ohio, at 8c. per bu. for 800 bu. of lump coal; **A. B. Conron,** Flushing, Ohio, 225 bu. at 8c. per bu.; **M. C. Huntsman,** Maynard, Ohio, 200 bu. at 7½c. per bu. Address Clk. Addison Saffell, Bd. of Edu., Fairpoint, Ohio.

Contract Notes

Atlanta, Ga.—The contract for furnishing the Atlanta Gas Co. with coal during the ensuing year has been awarded to the **Harlan Coal Co.,** of Louisville, Ky., after a series of tests of numerous different coals.

New Orleans, La.—The contract for furnishing the Central Ice and Cold Storage Co. and the Independent Ice Distilling Water Co., involving approximately 15,000 tons of coal, has been awarded to the **C. A. Andrews Coal Co.**

Missouri, Kansas & Texas Ry.—Press reports are to the effect that this road has awarded an exceptionally large contract with coal interests, who it is understood propose filling the contract on coal that will be stripped near Lehigh, Okla.

Dassel, Minn.—The contract for furnishing the local school with two carloads of Pocahontas egg coal has been awarded to the **Dassel Lumber Co.** at $6.85 per ton. Any further coal required will be furnished at $7.05 per ton. Address Clk. Olof Anderson, Bd. of Edu., Dassel, Minn.

Fond du Lac, Wis.—The contract for furnishing the local Water-Works with approximately 1,200 tons of coal has been awarded to the **Harcum Fuel Co.** at $3.25 per ton. The **Wisconsin Coal and Dock Co.,** of Milwaukee, was awarded the contract for furnishing 800 tons of coal for the schools and library at $3.64 per ton. All prices are f.o.b. Fond du Lac.

Detroit, Mich.—The contract for furnishing the Recreation Commission with approximately 300 tons of anthracite, stove, egg or smokeless has been awarded to the **Michigan Builders Supply Co.,** at $6.66 per ton for anthracite and $4.14 for smokeless. Bids were received from five other companies. Address Supt. Ira W. Jayne, Detroit Recreation Com., Bd. of Parks and Boulevards, Detroit, Mich.

New York—The contract for furnishing the department of Docks and Ferries with approximately 15,000 gross tons of buckwheat and 6,000 tons of semibituminous (p. 492), has been awarded to **Chas. D. Norton & Co.,** at $2.68½c. per ton on each grade. Meeker & Co. bid $2.89 per ton, and Pattison & Bowns the same. Address Comr. R. A. C. Smith, Dept. of Docks and Ferries, Pier A, foot of Battery Pl., New York City.

Auburn, Me.—The city contract for the supply of coal for the municipal year ending Feb. 29, 1916, was divided between **Bearce & Edwards Co.** and **Pulsifer & Young Co.** About 700 tons of bituminous and 300 tons of hard coal are usually required. The contract was awarded at $5.50 for soft and $7.50 for hard coal, to be delivered as required. Bids were not publicly advertised for and Mayor Henry R. Porter was empowered to close the contract.

Philadelphia, Penn.—Due to trial shipments made some six weeks since a number of inquiries for American coal are being received from Denmark. The Danish government realizing that the British supply will be materially reduced made a test of American steam coal in the navy, and there is no doubt that the coal has met with complete satisfaction. At the present time it costs about $14 a ton, f.o.b. Danish ports. If the Government is entirely successful a number of the important Danish coal brokers expect to place large orders here.

Japan—The Japan Chronicle of July 30 states that Japanese collieries have curtailed their output by over 20 per cent. this year as compared with last. In spite of this stocks are increasing. According to the latest investigations quoted by the Mainichi of Osaka, stocks of the collieries amount to 546,000 tons, and those on the Moji and Wakamatsu markets to 738,000 tons, totaling 1,284,000 tons. When small stocks in other parts of the country are taken into account, the grand total will exceed the unprecedented figure of 1,300,000 tons.

COAL AGE

Vol. 8 NEW YORK, OCTOBER 2, 1915 No. 14

"SAFETY FIRST!"

SAFETY
FIRST

It is a sounding slogan, all right, and a very excellent sentiment, too. But there are a large number of employers who seem to think it is nothing more.

They stick a lot of "*Safety-First*" signs in various places in the mine and on the surface and then imagine that their duty is done.

As a matter of fact that's only a small beginning.

"*Safety First*" means just that—"SAFETY FIRST."

It means that *safety comes before speed, efficiency or profit.* It means that every possible agency for preventing accidents must be provided in the places where men must work. It means that men must be warned and protected even against the results of their own carelessness.

"*Safety First*" means that no one—boss or miner—must "take a chance." It means that if there is any doubt whether a roof will hold, it must be timbered. If there is any question as to the strength of a cable it must be replaced.

"*Safety First*" means constant, unremitting, painstaking supervision of men and machinery. It means that chutes must be well guarded, powder must be tenderly handled, ventilation must be thorough and that every possible practical appliance which will eliminate risk and reduce humanity's liability to forget or overlook shall be installed.

"*Safety First*" means that money must be spent for equipment, for close supervision, for careful training. It means that every wise provision must be made against accident or disaster—and that there must be a drilled and capable rescue corps to take charge of the grim work of recovery if disaster comes.

"*Safety First*!" is a fine slogan, but if it is really to mean anything, it must be more than that—it must be a mission, a gospel, a religion.

By BERTON BRALEY

Ideas and Suggestions

Value of Competent Mining Engineering

Among many of the smaller operators today, as in the past, the engineering department is considered an unnecessary expense. The result is a higher cost of production through a poorly designed plant and unsatisfactory equipment. As a result of keen competition in the coal business, expenses have been cut in every way possible, and the engineering work has suffered severely.

Reflection has often been cast on the mining-engineering profession throughout the coal fields of the United States because of improperly designed plants and costly methods of production. However, this will be found due to one of two causes—either the work was not given into the hands of a competent engineer, or it was restricted through lack of capital.

At many of the smaller plants the engineering work is being done by some contracting concern from a neighboring town whose corps visit the plant once or twice a month. Projected work must either be put off until the arrival of the corps or done without their aid. Consequently only the most important work receives the attention of the engineers.

Economy of operation and a large percentage of recovery are the aims of every operator, and in order to realize these ends engineers must be employed capable of laying out both the outside plant and the underground workings in a systematic manner, suitable to the conditions found.

One reason for the unpopularity of the engineer is that he must build not only for today but for the future. His plans therefore call for a better grade of work and equipment, and the operator having his eye on the expense or cost, frequently will only approve of the cheapest construction.

Many operators when about to buy a piece of machinery write to several builders and state in a general way what is needed, and when bids are received there is found to be a wide range in the size and price.

Specifications Are Necessary

In the building of a plant it is necessary that specifications be prepared if the work is to be done by contract, for otherwise it is almost certain that only the cheapest kind of work will be secured. This is true also in the purchasing of equipment, for if there are no specifications there will be no satisfaction in the end, either to the buyer or to the seller.

The value of the data collected by an engineer cannot be overestimated in the laying out and projection of a mine. It is only when this information is at hand that the cost of haulage and drainage can be reduced to a minimum. There are many mines throughout the country where these items are eating up a big share of the profit. There are others where changes have been made and better results secured, but in these cases also the cost of experimenting has been paid.

Many tons of coal and much money have been lost as a result of inaccurate surveys. Coal mining requires accurate surveys and maps both of the surface and the underground workings. These maps should show the mine workings exactly as they are, and should be brought up to date at least every six months. Meanwhile, at the end of every month, all work done during the month should be placed on the map in colored pencil. With the aid of these maps the development work can be kept in proper order, and in the retreating work the fracture line can be kept in better shape.

An engineer is needed around a coal plant at all times. Efficient and economic operation can be secured only through his aid.

⁂

Importance of Little Things

By C. P. Shockley

"It seems to me," remarked the superintendent, "that economy does not play the important part in the operation of mines that it should, when we consider the wonderful opportunity we have to exercise it. The lack of economical methods has caused the loss of more money in the mining business than any other single feature.

"It is just as true in mining as in other lines that a dollar saved is a dollar earned, and is in truth a great deal easier to save than to earn.

"Of the large investments in equipment and improvements necessary at mines to offset wage increases and other conditions that materially influence the productive cost of coal, the effect is lost oftentimes by lax and uneconomical methods of management.

"Some officials are firmly imbued with the idea that to secure adequate returns large outlays are necessary, and entirely overlook the chances to save by careful management.

"The matter of saving in labor and supplies can of course be carried to such extremes that it will prove to be a menace, but a well-planned campaign of economy, if carefully administered, will yield good results.

"Our pitboss at No. 4 put on a heavy force last Thursday, an idle day, to clean tracks, the expense amounting to about $150. In the present state of the market, when demand for coal is light, the selling price low and work irregular, strict economy is necessary. He used this force of men to clean up the entries on the west side, where dirt had accumulated during the 'sweating season,' and argued that the cheapest way was to put on enough men to handle it in one day.

"At our No. 5 opening we have a mine similar in almost every way to No. 4, and our mine boss at this plant keeps close watch over the day men. As an illustration, when a track-layer is sent into an entry to lay a room turn, and the work is sufficient to keep him occupied for three-fourths of a shift, such a man sometimes will 'loaf on the job,' and thus lose enough time to have enabled him to finish out the shift at that place, take his tools to the parting at quitting time and be ready to make a fresh start in some other direction in the morning.

"This foreman at our No. 5 mine has a way of dropping in on such idlers and seeing that they finish up their work promptly and clean their track in a reasonable amount of time.

"At this same mine we had a number of loaders we called 'the early quitters,' men who when the turn ran good would slip away home early in the afternoon. After some little time the foreman managed to collect these fellows in one part of the mine—and not a very desirable part at that. When they drifted out early and the drivers in that section ran out of coal, he utilized them in cleaning roads the remainder of the shift.

"Another thing that greatly helps the boss when he is short of loaders and coal is coming slow, is to carefully arrange a transportation force sufficient to handle the output, the men not necessary for that purpose being delegated to cleaning track and doing other necessary work.

"When oil barrels are emptied and stored outside the mine (to store them inside is unsafe and is prohibited by the mining laws) they usually fall to pieces before a carload is accumulated, and a wise foreman will arrange a shallow pond with the expenditure of very little money, where by storing his barrels in a damp, shady place he obtains what we could appropriately call a large percentage of recovery.

"I have seen well-managed mines show a saving in the amount of timber, ties, spikes and rails used per ton that was remarkable, owing simply to a well-defined system of removing these supplies from worked-out sections before the falling roof buried them.

"All of the foregoing considerations impress upon us the importance of the mine foreman's work and emphasizes the fact that upon his shoulders rests the responsibility for carrying out the plans that will eliminate the various sources of useless waste and develop a system that will prove economical and successful."

⁂

Cleanliness and Efficiency

By E. S. Bonnet

On a recent inspection tour of the mine plants by the "big officials" of a large coal-mining company, the president criticized some of the superintendents rather severely on the uncleanliness and generally unfavorable appearance of the camps. He ordered a tipple painted here, a boiler house cleaned there, more windows and better light in the power house at another mine, while at still another plant he ordered the scrap material picked up from around the shaft and shop buildings and placed in a pile out of the way of the workmen.

Some of the superintendents commented on the orders in this fashion: "Why, the president didn't inspect our plants at all. He doesn't know anything about mining coal. All he saw was the outside of things—that this needed painting and that needed cleaning up. I'm glad he told us to do it, for it costs money, with no returns, and I would not have spent the money otherwise, even though I like to see things look nice."

This president is a successful man and knew what he was doing when he ordered things cleaned up. It so happened that about a month after the inspection tour some important changes were ordered in one of the tipples which it had been decided to paint, and when the work started the timbers were found to be so badly decayed that the tipple had to be virtually rebuilt.

In the power house where more light and a general cleaning up was ordered a large crack was found in the engine base, which probably would have shortly put the machine out of commission. This base was intended as a catch for the oil falling from the moving parts of the engine, but it ran through the crack and was disintegrating the foundation. A new engine bed was built, the crack was welded and the oil led into a receptacle. There is enough of this oil saved already to pay for the cost of the foundation improvements.

At another mine, where scrap was allowed to accumulate around the plant, a mule which was brought out of the shaft at night became frightened at something just as he stepped off the cage and ran into an old sheave wheel lying near the shaft and broke his leg.

The Men Prefer New Mines

It usually happens that when a new mine is opened in a district already producing there is no trouble in securing men. It seems as if most of the men want to work at the new plant. The reason is that the houses are new and better to live in, while the machinery is likewise new and easier to work with.

Why should men prefer new to old things? Because generally the old things are not kept clean and in repair. Isn't it logical to suppose that a man would prefer living in a house which has been his home for some years, which is freshly painted, is warm and well lighted, with a good roof, a nice fence around the place, and a nice lawn and flowers, than to move into a new house, with its consequent mud, dirt and strangeness? Why shouldn't a man prefer a piece of machinery with which he is perfectly familiar to one entirely new and strange to him, if the old piece is kept clean and in good working order?

In the course of my duties I have to visit a number of mines. In one of them the entries are kept clean, the fallen coal is quickly picked up, the ditches are frequently cleaned out, the falls of rock are immediately hauled away and the track is well ballasted. It is a pleasure to visit this mine. In another operation, the rooms are off sights, the track is crooked, the roadways are so full of fallen coal that one day in ten motor trips I counted seven derailments.

In this mine the ditches are not kept clean, in places the rail being under 3 or 4 in. of water. I have never left this mine with dry feet, and I dread the visit and put off the inspection as long as possible.

Think this over, Mr. Mine Man, and see at which plant you would rather work—at the plant which has fresh paint, where the dirt and scrap is cleaned up, which provides bright airy buildings and clean homes and streets, or the other plant, which has not seen paint since it was built, where the workshops are dark, the entries wet and strewn with coal, the yards covered with scrap and refuse, the streets unlighted and the houses filthy.

Which camp would you rather work and live in, Mr. Miner? And which plant, Mr. Superintendent, would you rather have charge of, and which plant do you think offers the most inducements for a man to give all the best there is in him to make the mine a success?

Control and Costs of British Rescue Stations

By Professor Henry Briggs*

SYNOPSIS—The writer compares the advantages of private with central mine-rescue stations and gives the reasons which sometimes make it advisable to treat the central station mainly as a place of training and in other cases to maintain it as an actual rescue center.

The control of rescue stations in America and Great Britain must necessarily differ for many reasons. The law relating to rescue work is not the same in the two countries; the nature of the training of the men probably also differs in details; and the average area served by a station must be considerably smaller in the latter country than in the former.

In *Coal Age* for Oct. 4, 1913, for example, is to be found a description of an admirable 40-hp. mine-rescue automobile built for the Pittsburgh Bureau of Mines, and at the end of that description it is stated that the car "is to be used to travel moderate distances, from 25 up to 100 mi." If my inference is correct and the station at which this car is housed serves a radius of roughly 100 mi., then it is quite certain that our British rescue stations are planted much more thickly than those in the United States, for in this particular connection we should not hesitate to call 100 mi. an extremely long distance.

But be these differences what they may, there is, I believe, sufficient in common between the rescue-station problems of the two countries to make a short review of the British position worth while.

Should Companies Combine for Rescue Work?

Rescue training and the provision of rescue apparatus are compulsory at the coal mines of Great Britain, complete exemption being only granted for small collieries so remotely situated that they cannot be served by a central station. As a matter of fact, exemptions are few in number. The regulations in question do not apply at all to oil-shale, ironstone, or fireclay mines which fall within the scope of the Coal Mines Act; nor even to metalliferous mines.

A colliery company is given the choice of complying with these regulations either by undertaking the training of its own teams and maintaining the necessary apparatus at the mines, or by joining with other neighboring companies in providing a central rescue station to serve them all.

Many companies have made careful inquiry as to which of these alternatives is the better. It is no secret that the mine inspectors are in favor of central stations as against individualized training. The question, however, is simpler to the inspector than to the colliery owner. The former does not trouble about costs, whereas the latter must. There can be no doubt as to the greater efficiency of the training procurable at a central station, where there is an expert instructor who gives his whole time to the work. Moreover, the apparatus itself is usually maintained in better condition at a central station than at a colliery. These advantages of coöperation cannot be neglected by anyone striving to reach a sound conclusion on the question, however much he may be obsessed by costs.

If Lord Roberts' dictum that "one trained man is worth ten men untrained" be accepted for rescue work as well as in its military sense, it might with equal truth be said that one properly trained man is worth five men half trained. Work with breathing apparatus, in fact, is dangerous under the circumstances which obtain at a mine fire or after an explosion, unless the wearers of that apparatus are thoroughly skilled in its use. Again, breathing equipment should be overhauled and tested with such frequency and care that the rescuemen can depend on its being in order at all times. A faulty apparatus is more dangerous than none at all. Unless the men are sure the equipment is serviceable they cannot have full confidence in it, and their personal efficiency is reduced thereby.

To sum up, if rescue training is done at all, it must be done well, and there is a better chance that it will be so done at a central station than when each coal company acts separately and according to its own lights.

Which Costs More, Central or Private Stations?

So much for the viewpoint of efficiency. But how about the aspect of cost? Obviously, the expense of a central station is borne more easily the more there are to share it. In fact, in a district thickly strewn with collieries the central station becomes by far the cheapest way of complying with the regulations of the Home Office. On the other hand, in an area where mines are few and far between such a station may be found too expensive. There must therefore be a point at which the cost of rescue-station training and that of individualized instruction is the same.

It is interesting to determine where this point lies. We are certainly not far from it in the Edinburgh district. Here there are roughly 10,000 men employed underground in coal mines, and in all 33 brigades (each of not less than five men) must be trained to satisfy the rules. Two companies, requiring between them six brigades came to the conclusion that it would be cheaper to train their teams themselves and to maintain the requisite apparatus at the collieries. Accordingly, they bought equipment and fitted up smoke galleries, and at each mine a man is engaged for part of his time in putting the brigades through practice drill.

The other companies in the district either convinced themselves that a central station would be cheaper or found so little difference in the figures that, on the ground of greater efficiency, they were able to approve of the centralization. I incline to the belief that under the conditions obtaining in Great Britain, at any rate, a central station scheme and independent training at the different collieries will cost about the same in a district requiring about 24 brigades. The consideration of efficiency, however, makes the central station preferable even for a smaller district, and as examples of successful stations serving small areas mention may be made of those at Tankersley, Yorkshire, and at Wath-on-Dearne, in the same county. The former, which was the first coöperative station erected in Great Britain, is connected with only seven collieries and the latter with only nine.

---

*Professor mining department, Heriot Watt College, Edinburgh, Scotland.

There is one other appeal that can be made in favor of the rescue station—it shifts a little worry and trouble from the mine manager's shoulders. Moreover, if he has to answer before a court of law or official inquiry for the provisions he has made as to rescue work, he will be more easily able to prove that he has done his best to comply with the regulations if his colliery is associated with a rescue station than if it is not.

Should a Fixed Corps Be Kept at the Station?

Assuming that the coal companies in a district decide to combine in providing a rescue station, they are faced with another problem. How is it to be run? There is a choice between two methods, which for convenience we shall term A and B. In system A the personnel at the station consists merely of the instructor-in-charge, who usually has an assistant. The brigades, each of not less than five men, are enrolled at the collieries and are sent to the station to receive their training once a week for at least 13 weeks.

In system B a permanent brigade resides constantly at the station, ready to be despatched to any associated colliery. This permanent brigade must consist of not less than six men, the instructor and five others, or, if there are more than 15,000 underground employees at all the mines served by the station, the brigade must consist of not fewer than eight men. With such an organization, which is much akin to that of a fire station, there is no need to train nearly as many men from the collieries as is required under system A; and as will be seen by the following table, the British regulations take this fact into account:

Number of Men Employed Underground	Minimum Number of Colliery Employees to Be Trained in Rescue Work System A	System B
Less than 250	5	1
250 to 700	10	3
700 to 1,000	15	
More than 1,000	20	5

With system A a group of mines belonging to one owner is treated as one mine for the purpose of ascertaining the number of men to be trained, provided the shafts or outlets lie within a circle of two miles radius. No such grouping is allowable under system B.

Which of these systems is the better is still quite an open question. If the second is to possess any superiority, it must lie in the better training that can be given to a permanent brigade of picked men, and everything must be subservient to bringing these men to a high pitch of efficiency and keeping them there. The weakness of the system is perhaps in carrying all one's eggs in a single basket.

Training Centers Cheaper Than Rescue Stations

Excellent in quality though the permanent brigade may be, it may suffer disaster, particularly if it consists of only six men. In this event a mine may be left with an insufficient reserve of trained men. The objection that a brigade housed at the station cannot know the mine as does one drawn from the employees at that mine is to some extent removed by the fact that there are, as the table shows, a few trained men at each mine capable of acting as guides.

When everything is considered the first system seems to me the cheaper as to running cost. I have had to analyze the question closely in reference to the rescue station which was recently built in connection with my department at the Heriot-Watt College, Edinburgh. In that instance the second system, had it been adopted, would have required the provision of a permanent brigade of six men. Five of these would have cost $9 per week each, while the sixth, the instructor, would have been given free quarters, coal, light and $750 per annum.

Allowing for this and all other station charges, except that of running the automobile, and adding the wages and railway fares of colliery employees undergoing training, it was estimated that the running cost for the first year would under system B be $6,090 and under system A $5,385, showing a difference in favor of the latter plan of $705. The estimated difference in first cost on the station and apparatus was nearly $15,000 in favor of system A, chiefly owing to the fact that under that plan housing accommodation for a permanent brigade did not need to be provided.

It is advisable to add that these figures are not meant to suggest any general conclusion in regard to the relative costs of the two systems. Conditions differ in every district, and estimates must vary accordingly. It is quite possible, indeed, that the running cost of a station under system B will be found actually less than under the rival system for a dense colliery area employing, say, more than 20,000 men underground within a radius of 10 mi. from the station. But the first cost must always be higher under system *B*.

How Idle Time of Rescuemen May Be Filled

Another objection to that plan is the difficulty of controlling a number of young men with so much slack time on their hands. They cannot always be practicing with apparatus or drilling in the gymnasium, and a station does not need an exceptional amount of manual labor to keep it clean and orderly. A strict, semimilitary discipline has to be maintained, and much more responsibility is thrown on those in charge.

This difficulty of an abnormal proportion of idle time has been met to some extent at the important Newcastle-on-Tyne rescue station, where the permanent brigade system has been in successful operation for a number of years. In that city the mine-rescue corps also furnish fire protection to factories and other properties. The Newcastle station is exceptionally fortunate in having been able to secure this additional work.

We in the Edinburgh district, at any rate, could not see that the advantages of the permanent-brigade system were so overwhelming as to counterbalance its drawbacks and its costliness and decided therefore in favor of system A. As a matter of fact the majority of British stations are organized under that plan, and the rest of this article is concerned with that system only.

The permanent-brigade system is in operation, however, at the Newcastle station already mentioned and at three other centers in Northumberland and Durham. It is also being regarded with favor, I believe, for the Lanarkshire station at Coatbridge; but this center is not yet completed. It is also worthy of remark that the permanent-brigade system is that adopted at the important station in Liévin, northern France.

The following figures refer to system A, under which the only person housed at the station is the instructor, and they assume that one of the forms of oxygen-regenerator breathing apparatus is to be adopted.

Unless buildings already exist which can easily be adapted, a central station on not too lavish a scale usually costs between $10,000 and $12,500 for buildings and permanent fittings. To this must be added $5,500 for a complete equipment and from $2,500 to $3,500 for a specially built automobile. It is also wise to buy a second car—a light, cheap knockabout at, say, $1,000. Treated considerately, a light car of this kind is economical and handy for running to collieries when the apparatus maintained at the mines has to be changed for freshly charged and overhauled apparatus from the station or when brigades are to be put through their drill at the mine.

The annual running costs of a station, not including those of the automobiles—a variable item—usually amounts to about $22 or $25 per person trained. This figure does not cover the wages and fares of the men.

Owing to the increasing price of materials and labor, the first cost of a station has a continual upward tendency. On the other hand, recent improvements in regenerators are considerably reducing the expenditure for drills. When the liquid-air apparatus is adopted the first cost is increased, but the running cost is still further cut down.

How Collieries Share First and Annual Costs

In Great Britain the whole cost of a rescue station is borne by the colliery owners. There is assistance neither from the government nor from the miners' union.

There are four methods in use by which the costs of a rescue station are shared among the various companies associated with it. These are as follows:

1. Imposing an equal share on each colliery.
2. Dividing charges according to the number of brigades requiring training.
3. Apportioning expense according to the coal output of the collieries, or, what is almost the same, according to the number of underground employees; or
4. A method combining methods 2 and 3.

The first plan, which is employed at two of the smaller coöperative stations, may be dismissed at once. It is manifestly unfair to the smaller concerns.

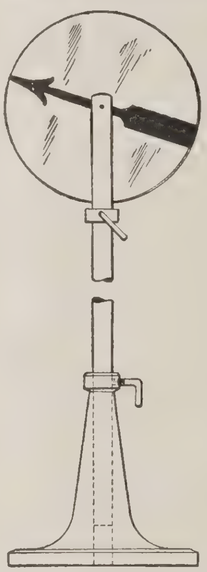
The number of brigades requiring training under system A is not in proportion to the number of underground employees, for large collieries have proportionately fewer corps than smaller operations. Thus a pit employing 150 men below ground requires one brigade of 5 men, whereas a pit employing 1,500 requires, not ten, but only four brigades. The second method of dividing the costs presses somewhat severely, therefore, on the smaller collieries. They find that with that method their expenditure for rescue work, when expressed per ton of their output, is more than is being paid per ton by a large colliery near by.

Some of the larger collieries, on the other hand, are up in arms against the third method—which is nevertheless the commonest of all. They claim, with a show of justice, that as their legal obligations are met by proportionately fewer brigades, their costs should be proportionately less. The result is that the smaller companies are passionately devoted to method 3, while the larger companies are just as strongly in favor of method 2.

As it must be admitted that there is something to be said on both sides, a compromise may have to be sought. It is found in method 4, which is that adopted by two stations. Probably the most equitable system on which to divide rescue-station costs is to share the first cost of the station and equipment on the tonnage basis, or, alternatively, according to the number of underground employees; then to divide the annual running cost under two heads—that is, "training charges" and "general charges," the former being distributed according to the number of brigades each company requires and the latter in proportion to the tonnage mined or to the number of underground employees engaged.

Under "training charges" go all items of annual expenditure directly resulting from the training or practicing of brigades, such as the cost of chemicals and oxygen, repairs to apparatus, charging lamps and a fair proportion of lighting and heating costs. The "general charges" include everything not placed under "training charges."

A Holder for Danger Signs



A CONVENIENT DANGER SIGN

Safety experts attach much importance to the disk-shaped danger signs of different colors now used by many industrial concerns, says J. E. Cooley in the *American Machinist* of Sept. 2. The drawback, however, found in using these signs is that there is not always a suitable place to hang or tack them up at a point where danger exists. The workmen are therefore exposed to hazard because it is too much trouble to provide a means by which the admonition may be displayed.

The illustration shows a danger-sign holder that can be moved about for temporary use or fastened to the floor. It is made so that it can be used anywhere and is so constructed that the sign can be set to point directly toward the danger to be avoided.

It consists of a cast-iron base having an adjustable rod about ½ in. diameter, held in place with a binding-screw in the base. The top of the rod is sawn down a short distance through the center so as to provide a place for the sign, which turns in a small pin, as shown. The binding-collar and screw near the top secures the sign in place, after the arrowhead is set to point at the danger to be avoided.

The use of these holders will prevent many accidents. Several of these signposts should be made and placed where they will be accessible at all times.

A Safe Switchboard

At many mines where electric transmission is employed crude means are provided for switching the current on and off. Not long ago a mine came under my notice where a knife switch attached to a pole exposed to the weather and within reach of a tall man was used for this purpose. When in the morning the men wanted to throw on the power they would do so with the aid of a stick. Frequently the stick employed was wet, with the result that the man who used it would receive a shock.

I changed this method and installed a switchboard in a small building, guarded as shown in the illustrations. Now when there is anything the matter with the lines the electrician can lock out the switch which controls the defective circuit with a private lock, to which no one but himself has a key. This insures that he will be entirely safe from injury caused by the switch being thrown in either by mistake or through ignorance.

To make these switches safer, a set of lights was installed, which burn whenever the power is on the line, thus illuminating the switch-house, which enables the men to see plainly the live wires coming into the switchboards.

Several experts have examined this installation and said that it was "all to the good," and that they could not see where the design could be improved, considering the work to be done.

Coal Mining in Montana

Montana mines produced 2,805,173 short tons of coal in 1914, valued at $4,913,191. As compared with 1913 the production of coal in Montana in 1914 showed a decrease, according to the Geological Survey, of 435,800 tons in quantity and $740,348 in value. The major part of this decrease occurred in Carbon and Musselshell Counties, the coal of which is used mainly by railroads, and in the Great Falls field, in Cascade County, which supplies a large quantity of coal to the copper smelters of Anaconda and Great Falls. Other coal fields, however, such as the Lewistown, in Fergus County, which supplies the domestic trade, showed a small increase such as normally follows an increase in population.

There were no serious interruptions to mining operations in 1914 because of labor troubles, and there was no scarcity of labor. A total of only 171 men was reported on strike, for an average of seven days each. The quantity of machine-mined coal increased from 1,076,641 tons, or 33.2 per cent. of the total product, in 1913, to 1,213,051 tons, or 43 per cent. of the total, in 1914. The proportion of coal shot off the solid decreased from 35 per cent. (1,143,364 tons) in 1913 to 32 per cent. (895,279 tons) in 1914.

The number of men employed in the coal mines of the state in 1914 was 3350, and they worked an average of 209 days, as against 3630 men for an average of 228 days in 1913. The mine workers of Montana have a good record for efficiency, the state in 1912 showing the best average production per man per day among all the coal-producing states. In 1914 the average production per man for the year was less than in 1913 (837 tons against 893 tons), but the average daily output by each employee was 4 tons in 1914 as against 3.92 tons in 1913 and 4.03 tons in 1912. The fatality record maintained by the Bureau of Mines shows a decrease from 20 in 1913 to 8 in 1914. Thus the loss of life in the mines for 1913 was one man per 181.5 employed or per 162,048 tons mined. In 1914 the loss was only one man per 418.8 men at work or per 350,647 tons of output.

Mine Rescue Signaling Device

By Oscar Cartlidge*

SYNOPSIS—An electric cable life line for mine-rescue work has been devised by the safety inspector of the Superior Coal Co.

The illustration shows a signaling device for mine-rescue and fire-fighting crews, based on the ideas of James Boston, safety inspector for the Superior Coal Co., Gillespie, Ill. It was worked out and perfected by Herman L. Seekamp, chief electrician for the same company.

Three No. 6 Columbia dry-cell batteries are placed inside the spool of a regular Jeffrey machine-cable reel, to which is connected 1,000 ft. of round, insulated, No. 16, three-wire cable. In the hub is fixed a "buzzer" button, and to the other end of the wire is attached a "buzzer" of the ordinary type, which is inclosed in a moisture-proof brass case of special design. This is provided with a loop through which the belt of the operator is passed. A stout cord of sufficient length and having at one end a stirrup or handhold is attached to the wire about 5 ft. from the end, and by this means the cable can be dragged without putting any stress on the buzzer. Similar handholds are placed at regular intervals for others of the crew.

In the operation of the device the reel is carried to the "station" or base of operations and is left in charge of a "reelman," whose duty it is to see that the wire does not become entangled while being paid out and to take up slack when notified through the life line. He also attends to all instructions received from the rescue team. A printed code of signals is attached to the reel, and a similar code is carried by the inside leader; but as a further precaution he is also required to memorize it.

The following code has been devised for use by teams at work, it being the intention to have as few signals as possible, because they should be memorized by all the inside men.

CODE OF SIGNALS FOR USE WITH LIFE-LINE

From Inside to Outside

One long ring means "All is well."

One short ring means "Take up, or stop taking up life line."

Two short rings mean "In dark; coming out."

Three short rings mean "Trouble; send in assistance."

Four short rings mean "Rescue corps leaving life line."

From Outside to Inside

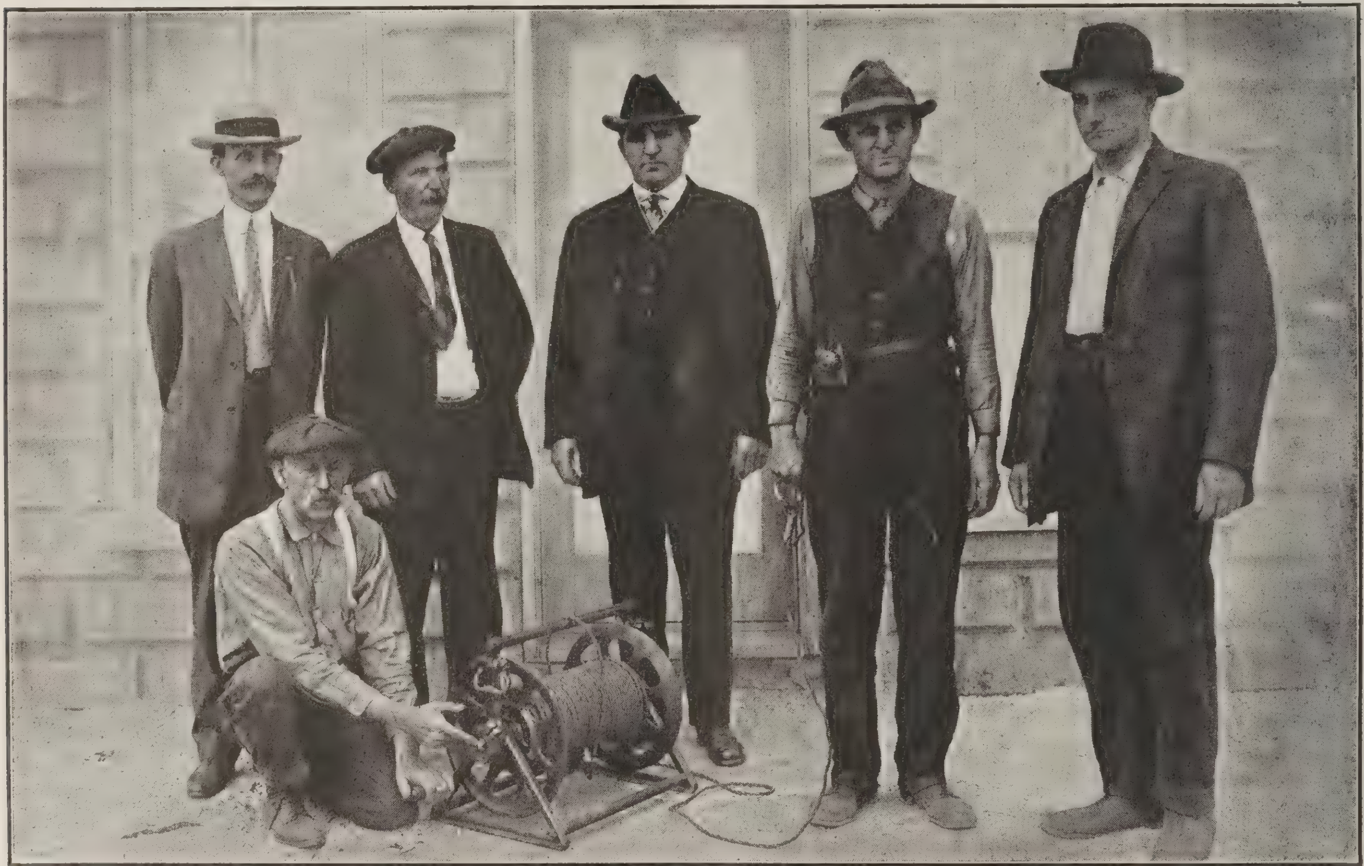
One long ring means "Want to hear from you."

One short ring means when life line is in motion "Stop," and when life line is stopped means "You may proceed."

Five short rings mean "Assistance coming."

This device is not only useful for signaling purposes but serves as a life line for inside crews when they are compelled to make their way out of the mine in dense smoke. It has an advantage over a telephoning apparatus in that it is not necessary to attempt articulation, which is always difficult when wearing a breathing apparatus in irrespirable air. It is out of the way, compact, and therefore easily transportable. Its entire weight does not exceed 100 lb., and it costs to construct, including 1,000 ft. of wire, not more than $40.

This apparatus has been proved to be satisfactory and practical after long use in the Superior Coal Co.'s mines.



A GROUP OF OFFICIALS WITH THE MINE-RESCUE SIGNALING DEVICE

From left to right, standing—Oscar Cartlidge; Archibald Drew, state mine inspector; John P. Reese, general superintendent of properties of the Northwestern R.R.; Herman L. Seekamp, chief engineer, Superior Coal Co.; and P. H. Shanahan, superintendent, Superior Coal Co. The man kneeling is James Boston, safety inspector of the same company

Mechanical vs. Manual Methods of Resuscitation

By Dr. James M. Booher*

SYNOPSIS—While manual methods of resuscitation serve a useful purpose, the air they furnish is less than is naturally supplied by vital action when the person is in normal condition. The author states what characteristics he believes an insufflator should possess.

Resuscitation of the apparently dead has been attempted by various means since the beginning of history. The ancient Greek and Egyptian physicians used reeds through which they endeavored to blow air into the lungs. The first really organized effort toward establishing permanent first-aid stations was made at Amsterdam, Holland, in 1767. Shortly after this, in 1774, the Royal Humane Society was organized in London. Its record shows that it used the bellows successfully as a means of resuscitation. For a considerable length of time the methods of this society were regarded as standard and received the approval of the civilized world.

Dr. LeRoy de Etoiles, who experimented on the apparently dead, especially with the bellows, reported to the French Academy that lung tissue could be ruptured by this means. Following this report, the French Academy appointed Dr. M. M. Dumerial and Dr. Magendie as a committee of investigation. The report which these two physicians made to the academy was not read for several years after it was submitted, and, due to a misunderstanding, the medical profession of the entire world was under the impression that this committee had condemned mechanical resuscitation.

What the committee actually did report was that the bellows, which was the device in general use up to that time, was the best means known of preserving the life of those apparently dead from asphyxiation and other causes, and they recommended that more time be devoted to the training of the men who were to use the bellows, and that the instructions given them be so modified that the attendants would not injure the lung tissue.

Following this, Dr. Silvester brought forth his manual method of inducing resuscitation of the apparently dead. This was followed by the introduction of the Schaefer manual method.

Manual Methods Furnish Only Minimum Air

The Schaefer and Silvester manual methods of artificial resuscitation are now in universal use. Many thousands of men have been trained, and rightfully so, in their use. That they are the most available of the manual methods of resuscitation and can be applied immediately is the principal argument in their favor. They were formerly thought to be much more efficient than they really are. The early experimenters, in examining and investigating both methods, failed to take into consideration the fact that the conscious individual will automatically take just the amount of air that he desires. They overlooked the fact that this is an involuntary action and cannot be controlled.

Later investigators, by performing experiments on a subject in apnœa (a condition where all desire to breathe has been removed) found that the air exchange secured by these manual methods is dangerously near the minimum requirement for the preservation of life.

The maximum amount of air exchange which can be afforded a subject in apnœa, by use of the Silvester or Schaefer manual methods is 300 c.c., whereas a person normally breathes at each respiration from 500 to 600 c.c. This shows that neither method will give a man as much air as he would normally breathe. The only known means of giving an asphyxiated person a sufficient amount of air to maintain life is by forcing this air into the lungs mechanically. The following table, taken from Technical Paper 77, United States Bureau of Mines, shows the exchange of air secured in a normal subject and in one in apnœa. In other words, the table shows the amount of air a man normally breathes and the amount of air exchange that can be secured by the Silvester and Schaefer manual methods.

	Subject Normal	Subject in Apnœa
Silvester method	500-600 c.c.	150-200 c.c.
Schaefer method (arms flexed at sides)	500-600 c.c.	125-200 c.c.
Schaefer method (arms stretched forward)	500-600 c.c.	200-300 c.c.
Natural breathing at the same rate as the artificial	500-600 c.c.	

In order that the amount of air replenishment secured by manual methods, as given in the table may be compared with that obtained by mechanical means it may be stated that the lungmotor will give an air exchange of 750 c.c. per respiration.

What Is Needed to Restore an Asphyxiated Person

When a person is breathing naturally there is an increase in the "negative pressure" in the thoracic cavity. This is known as the suction action of respiration on the heart and great vessels. That the manual methods do not permit or cause the normal fluctuations of pressure in the thoracic cavity also contributes to their inefficiency. It is now a recognized fact that it is necessary to maintain the statics (pressures) in the thoracic cavity if the following ends are to be obtained:

1. Restored circulation, which (a) renews the suction action of the thorax, (b) tends to prevent fibrillation of the heart, and (c) raises coronary blood pressure.
2. Restored respiration, because (a) the blood must be supplied with oxygen; (b) this oxygenated blood must be carried to the respiratory, circulatory and other brain centers; and (c) this oxygen must be in sufficient amount to maintain the cell metabolism of the brain.
3. Normal exchange of air.

It is understood that the above-mentioned results can be obtained only with a mechanical device, and then only during the period previous to that of absolute oxygen want and a few minutes thereafter.

The dangers inherent in both the Silvester and Schaefer manual methods of artificial respiration, though real and not of infrequent occurrence, have probably been magnified. They should in nowise negative the use of either method. In case of accident one of these methods—preferably the Schaefer—should be followed immediately, but a mechanical respirator should be secured as quickly as possible, because in critical cases, where a real period of oxygen want is being experienced, the mechanical device will do that which neither of the manual methods can accomplish.

---

*Medical director, Life Saving Devices Co., 6743 Evans Ave., Chicago, Ill.

The fact must always be kept in mind that a mechanical device, to be successful in resuscitating an unconscious individual, must be applied within a reasonable length of time. In other words, the device must be readily available to the scene of accident. One of the great troubles in connection with mechanical respiration has been that the general public did not realize that in order to be effective the devices must be applied within the first half hour after an accident. This is a maximum time. A larger percentage of lives will be saved by devices applied within the first 15 min. than when their use is delayed for the longer period.

In cases of electric shock and drowning, no more than 15 min. should elapse after the accident before the device is applied, and more lives will be saved where the appliance is used during the first 5 min. This is not impossible of accomplishment, because the devices are small enough to be placed on every electrical repair wagon, in every power house and at all points where an accident may be likely to happen.

As an example, experience has taught that, in cases of drowning, the machines which are located on the beaches, where the accidents are liable to occur, have been extremely successful in resuscitating all those who have been removed from the water within a reasonable length of time after submergence.

In cases of carbon-monoxide poisoning, or gas poisoning of any character, the time limit for the application of mechanical resuscitating devices is much greater than in cases of drowning or electric shock, because a man who has been overcome by gas may remain in a condition of partial oxygen want for a considerable period of time before an absolute deprivation of oxygen from the system occurs. In other words, the success of any device after any given period of delay depends entirely on how much carbon monoxide has been absorbed by the hemoglobin of the blood. In such cases it is desirable that the oxygen be administered under pressure, in order that a greater absorption of oxygen may be secured.

What an Insufflator Should Do

The securing of an efficient mechanical respirating device has been a laudable object of experimental work by physicians for many years, and as a result a number of devices were made which were without doubt more efficient than the manual methods and which have been used most successfully in cases of gas poisoning.

Mechanical resuscitating devices until recently have not been so successful in electric shock and drowning because in these two conditions it is necessary to accomplish many things which the machines failed to do.

In drowning, the devices failed to remove the water from the mouth and trachea and to draw the mucus from the air passages. In electric shock they failed to maintain the statics (normal pressures) of the thoracic cavity, and had practically no tendency to facilitate the heart action by increasing coronary blood pressure.

They were simply devices for putting air into and removing air from the lung, and the fact that they could give sufficient air to maintain life was their only favorable feature. The dangers inherent in them were recognized by many persons, but when life was seriously menaced these dangers were not sufficient to warrant a rescuer in not using such devices.

At the present time there is on the market a device, the lungmotor, which is safe, effective and small enough to be available for general use. This apparatus was under observation and the closest investigation of the United States Bureau of Mines for about 19 months before that body decided to install it in its first-aid cars and stations. This was in April of the present year.

In the light of present knowledge a mechanical respirator, in order to be acceptable to the medical profession and the public at large, should be able to conform to the following standards, and with these the lungmotor adequately complies:

(1) No mechanical respirator should be considered efficient which will not keep alive an animal so completely curarized that it cannot breathe. In any such test when the mechanical respirator is stopped the breathing of the animal should cease. (2) Normal excursions of the diaphragm should be secured with visible inflation of the air sacks, as shown by inspection of the surface of the lung. (3) The device should be able to remove water from the mouth and mucus from the trachea. (4) It should be able to give air at all times and oxygen and air in any percentage desired. (5) It should keep a lung full of air within the normal diameters of the lung itself. (6) There should be no distension of the lung to the extent which would elongate or flatten the lung epithelial cells. (7) The device should be capable of developing sufficient pressure to remove any foreign object which is not too tightly lodged in the trachea. (8) It must supply a sufficiently rapid exchange of air to maintain human life. (9) The air or oxygen should be introduced into the lung under a safe pressure. The maximum pressure within the limits of safety is desirable. (10) There should be no direct suction action upon the air cells. (11) Suction should be developed within the trachea, but not transmitted to the ultimate air vesicles. (12) The device should maintain the normal pressure within the thoracic cavity, but not within the lung, where a positive pressure is desirable. (13) The device should in no case create a vacuum in the lung or passages. (14) The lung should be kept as nearly as possible in the position in which it was during life. (15) An even rise and fall of the chest wall should not be considered necessary, but it is desirable. (16) The device must be safe, efficient, available and always ready; that is, it should not be so constructed as to get out of order easily.

There is no claim made by the various manufacturers of resuscitating devices that their apparatus will revive the dead; but the claim that a person may be apparently dead and may be revived is borne out by experiments performed in the physiological laboratories, as well as by the experience of men who have used resuscitating devices in many accident cases.

As an example of this: A dog may be apparently killed by ether anæsthesia. He may cease to breathe and his heart may stop beating, and a mechanical resuscitating device will bring him back to life. That this has been done by an eminent physiologist in the United States 30 min. after all respiration and heart beat have ceased shows how tenacious of life animals are.

Cost of Upkeep of Electric Cap Lamps

SYNOPSIS—The material used in the maintenance and repair of lamps at the Crow's Nest mines of the Keystone Coal and Coke Co., excluding all damage caused by miners, has cost not quite 1c. per lamp shift for the six months since the lights were installed.

The Keystone Coal and Coke Co. has its leading mine at Crow's Nest, near Greensburg, Penn. This mine is one of the best and most efficient in the State of Pennsylvania. One of its uptodate features is the installation of electric cap lamps, of which 250 are in use. Illustrations of the lamp and battery racks are shown in this article, and tables will be found setting forth the cost of maintenance and that of mechanical injuries sustained by the lamps when in the charge of the miners.

In the six months covered by the report the lamps were burned for 34,419 lamp shifts. The list cost of the spare parts totals $521.83. A discount of 20 per cent. may be figured on these prices, leaving the net cost of parts and acid consumed $417.45.

But of this some material was broken while in the care of the miners:

6 lamp bodies, at 70c.	$4.20
20 lenses, at 20c.	4.00
218 bulbs, at 45c.	98.10
3 safety devices, at 25c.	.75
2 lamp holders, at 15c.	.30
	$107.35
Less 20 per cent. discount	21.47
Net cost of material	$85.88

This leaves $331.57 of the cost chargeable against the lamp-station expense, and dividing the sum thus obtained by the number of lamp shifts, 34,419, the cost of material obtained is $0.00963, or less than 1c. per lamp shift.

These figures are obtained from daily reports, which are made out in duplicate by the man in charge of the lamp station. One copy is delivered to the mine foreman and the other to the company supplying the lamps, the Mannesmann Light Co. of America. The reports from the lamp foreman are on file and can be inspected by anyone.

It will be noted that the figures given include not merely what are known as spare parts and repairs, but sulphuric acid and celluloid paste also. Thus all possible material charges are included, though of course it will be observed that the cost of current, amortization, interest and labor of lampman are not figured.

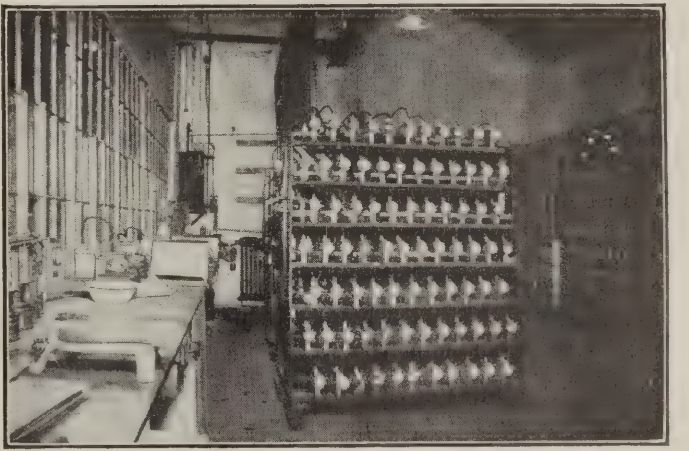
Bulbs and Cables Are Chief Repair Items

It is noticeable that the cost of electric bulbs and cable are the two principal items in the list. Schedule 6A of the United States Bureau of Mines requires that the average life of lamp bulbs shall be not less than 300 hr. for primary and acid storage batteries and not less than 200 hr. for storage batteries using an alkaline solution. Not more than 5 per cent. of the bulbs examined shall give less than 250 hr. life with acid batteries, nor less than 170 hr. life with batteries having an alkaline electrolyte.

If the number of working days in the month is taken at 25 and the number of shift hours at 12, there would be 300 hr. during which the lamps would be in use in any month. Under such circumstances a bulb of 300-hr. capacity would have to be renewed every month, or 12 times in a year. If the price of each bulb is 36c., the cost per annum would be $4.32 per lamp per year. This maintenance would be far too heavy, as it covers the cost of bulbs only.

Over 600 Hr. of Burning per Bulb

At Crow's Nest the total number of approved bulbs received up to Sept. 18, 1915, was 995. Some of these of course were mounted in new lamps and others were placed in stock. On Sept. 18 there were 157 bulbs in reserve. Thus there were 838 bulbs broken, consumed or in use. The miners had broken 218 bulbs in service. It seems conservative to rate half of these as burned-out bulbs. The bulbs were destroyed by the mishandling of the miners, but not being new they would not have burned as long as bulbs from stock, even if they had not been injured. The loss from negligence can therefore be calculated as being equivalent to 109 bulbs.



LAMP RACKS AND TENDING TABLES AT CROW'S NEST

This can be deducted from the loss as previously obtained, leaving 729 bulbs destroyed by burning out. The same assumption, that the bulbs when unbroken have still half their life unexpired, may be applied to the bulbs in the lamps. There are 250 of these. It will be assumed that their life is equivalent to that of 125 bulbs fresh from stock. These bulbs can be deducted from the number already obtained and the bulbs actually consumed will be 604.

The number of lamp shifts of these 604 bulbs is 34,419. Each shift is taken at 11 hr., giving 378,609 lamp hours, or 627 burning hours per bulb, or 57 shifts of 11 hr., instead of the minimum average as required by the bureau for an acid battery, namely, 300 hr.

Assuming the number of shifts in a year to be 300, then 5.26 bulbs will be needed per year, which at 36c. would entail an expenditure of $1.89. Where the Mannesmann Light Co. maintains its lamps at so much per shift it stipulates that the operating corporation shall charge its miners with the net amount of all material destroyed through the carelessness of these employees. It is fully justified in assuming therefore that the estimates of lamps broken by miners is not in any way excessive.

Cable Breakages May Be Further Reduced

The cable used is marked as 5 ft. long. As a matter of fact it need only be 4½ ft. The additional 6 in. is added for conservative estimation. The cable is the one part of the lamp still furnishing a small problem to the manufacturers, and efforts are being made to solve it in a more satisfactory degree.

This is indeed the weak point in electric cap lamps; but the lamp firm to which we have referred has introduced at Crow's Nest a cable attachment which seems to remove this trouble, and about 50 per cent. less breakage has been experienced with the new cable equipment than with that on which the figures quoted are based. As soon as the practical tests now under way have been conducted for a sufficiently long period of time more information will be published.

MATERIAL DESTROYED BY MINERS AT CROW'S NEST MINE FROM MAR. 22 TO SEPT. 18, 1915

Period	Lamp Bodies	Lenses	Bulbs	Safety Devices	Lamp Holders
Mar. 22 to Apr. 30	1	5	50	1	1
During May	3	4	52	1	..
During June	..	3	45	..	..
During July	.	1	34	..	..
During August	1	6	23	1	..
Sept. 1 to Sept. 18	1	1	14	..	1
	6	20	218	3	2

According to observations made, a lamp cable is bent on the miner's back about 7,000 times during the length of a single shift. It is easy to understand therefore to what a severe service it is subjected. It is not so much the kind and quality of the cable which is in question. The important matter is the manner in which the cable is attached to the lamp and battery casing. The tests mentioned are being made from this point of view.

Lamp-Tending Charge Less Than 2c.

It is necessary to consider not only cost of material but the labor and amortization charges. The experience of the Mannesmann Light Co. has been that one man can handle at least 150 electric safety cap lamps and give perfect satisfaction. Thus 300 lamps could be tended by one lamp master and his assistant. If these men are paid $3 and $2 a day respectively, and 25 days are figured to a month, the monthly payroll will be $125. If they work to capacity—that is, charge and clean 300 lamps for each of the 25 shifts—each lamp-shift labor charge will be 1.66c., or about 1¾c.

All Costs but Those for Current Total Less Than 5c. a Lamp Shift

In figuring the battery maintenance charges no consideration has been given to battery renewals, because in the six months during which the lamps have been installed at the Crow's Nest mine the batteries have not needed any repairs. But the time will come when they will, so it is well to be safe and to double the repair bill arbitrarily, making that item 2c. Adding the labor charge to this, the cost of operating is 3.7c. per lamp shift.

BATTERIES RECEIVING RENEWING CHARGE

The custom in most American coal mines is to charge the miner at least 5c. for the use of a safety lamp during one shift. Taking 5c. as the charge, the balance left for the operator would be 1.3c., and this would have to cover amortization and interest on invested capital. A small lamp plant of 300 lamps running 250 shifts per year would give a total of 90,000 lamp shifts, which at 1.3c. would provide $975 for amortization and interest.

Such a plant for the Manlite lamps, including the lights themselves, would cost about $2,750. An amortization charge of 30 per cent. and 6 per cent. interest would amount to $962.50. So it will readily be seen that the electric cap lamp not only gives a good light and assures safety from gas and other causes, but also is at 5c. per lamp shift by no means an unsatisfactory investment. To the advantages of cap lamps already mentioned may be added those of cleanliness, lightness and general availability.

Self-Acting Ventilation Door

By J. F. K. Brown*

SYNOPSIS—A type of door is here described which is opened by the car in the opposite direction to that in which the car is moving. It closes under the influence of gravity and the air current.

Conditions sometimes arise in connection with the problems of ventilation in collieries where the use of a self-acting ventilation door would be of material service. The following description may therefore prove helpful.

Doors of this type are in daily operation in the Hamilton Palace colliery of the Bent Colliery Co., situated in the Lanarkshire coalfield of Scotland. The ventilation of the Nos. 1 and 2 mines is rather peculiarly arranged, in that while the No. 1 mine is the return air mine, No. 1 shaft is the downcast, the reverse being the case with No. 2. This makes it necessary to have every road leading from the bottoms of Nos. 1 and 2 "doored" off, since otherwise the air would short-circuit from the one shaft to the other without getting near the workings. Furthermore, the doors have to be so constructed as to perform their duty thoroughly, as the two shafts are situated at one end of the leasehold and the workings extend for 2 mi. from the shaft, with no other air outlet. The course of the air in the mines is down No. 1 shaft and through special air courses to the main roads leading from the bottom of No. 2 shaft (the doors preventing the return of the air direct to No. 2), thence through the workings of the No. 2 mine, up to the No. 1 seam above, through No. 1 workings and back along the main roads almost to No. 1 bottom, there being again diverted by doors and directed to the No. 2 shaft and the fan.

This arrangement creates a pressure inward in the No. 2 shaft bottom and outward in the No. 1 shaft bottom. As coal travels in and empty cars out from each shaft, it follows that some of the doors have to be opened by cars traveling in the same direction as the pressure exerected on the door. In other words, the doors have to be opened against the air pressure before the cars can pass through them.

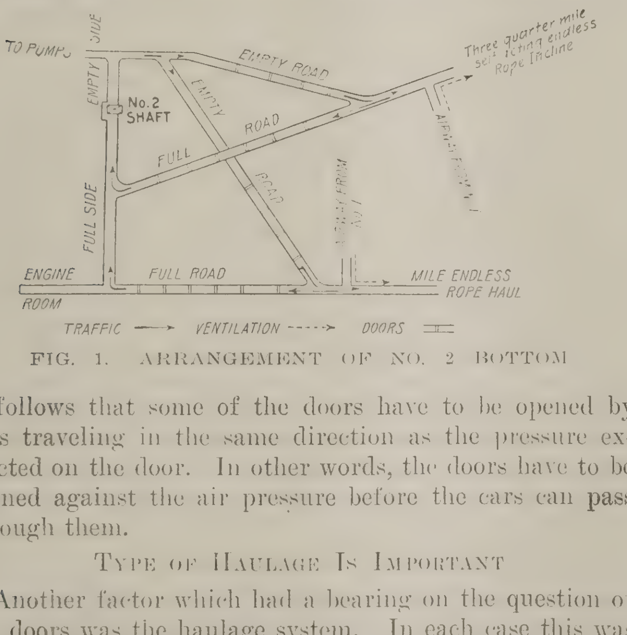

FIG. 1. ARRANGEMENT OF NO. 2 BOTTOM

Type of Haulage Is Important

Another factor which had a bearing on the question of the doors was the haulage system. In each case this was of the endless-rope type, and thus a slow-moving but steady stream of cars passed through the doors coming at fixed intervals. The cars are spaced at 40-ft. intervals on the rope and the doors at a distance apart either greater or less than 40 ft., depending on the condition of the roof. Such an arrangement of spacing provides against the possibility of all the doors in any one road being opened at one time and so short-circuiting the air.

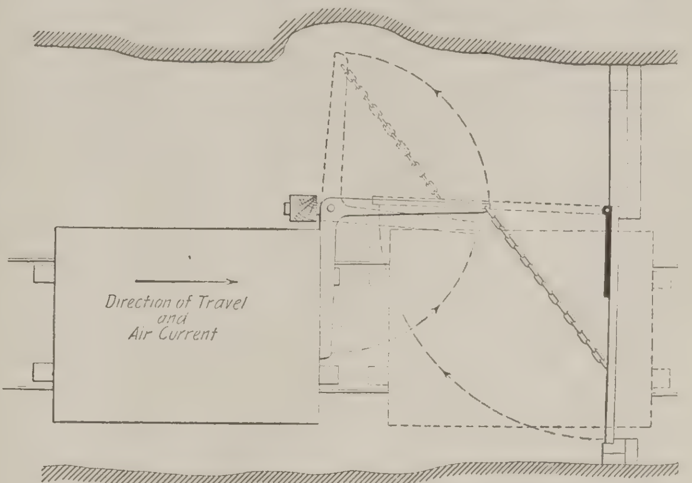

FIG. 2. ARRANGEMENT OF DOOR AND DOOR-OPENING DEVICE

Fig. 1 shows the layout of the No. 2 bottom, the position of the doors, direction of the traffic and the direction of the air current. One of the haulages feeding the No. 2 shaft is a ¾-mi. self-acting endless rope, the other being a power-driven endless rope. The two combined pass daily through the doors on both roads a total of approximately 900 tons of coal—1,400 cars. About the same tonnage goes to the No. 1 bottom.

The actual arrangement of each door is clearly seen in Fig. 2. It consists simply of an ordinary swing-door, to which is attached a home-made device by means of which the door is opened by the advancing car before passing through. The door is opened by a flat-iron bell-crank, to one end of which a short piece of chain is attached, which is connected to the door at a point about three-quarters the width of the door from the swing or hinge side. The other arm of the bell-crank is free and acts as the operating lever. An upright post placed just clear of the passing cars has a pin fixed in it, to which the bell-crank is hung at such a height from the floor as to catch the cars fairly in the middle. When the door is shut, the chain attaching the lever to the door is drawn almost tight, which causes the other arm to assume a position roughly at right angles across the track. On the approaching car coming in contact with the lever it first tightens the chain and then, as the pressure due to the haul rope increases, the door is "jerked" open and swung clear of the track. The relative position of doors, lever, post and cars is so arranged that, in opening, the door swings into the space formed by the two arms of the bell-crank, and thus the operating arm coming between the car and the door serves as a guide, holding the door back while the cars pass through. Both the post to which the lever is attached and the door posts are set at such an angle from the perpendicular—leaning toward the track—that just as soon as the car passes, the operating lever begins to swing toward the center of the roadway, bringing the door with it, aided by the "set" of the door itself. Then the air pressure catches the door and shuts it tight.

---

*Mining engineer, 247 Esplanade, Sydney, N. S.

THESE DOORS ARE EASILY INSTALLED

A door of this design has the advantage of being exceedingly plain and is simple in construction and easily repaired. It can be successfully operated on any mechanical haulage road where the rate of travel is low, but is useless on high-speed "trip" systems. With the constant banging to and fro it may be thought that these doors would quickly get out of order; but if strongly built in the first place and properly cared for by the trackmen they will give long service, even though the installation is a heavy-traffic proposition.

When such doors are erected on a road used as a traveling way as well as a haulage road, caution must be observed when passing through them. When going with the traffic, never pass immediately in front of a car, but always behind it; while if going against the traffic, always wait at each door till a car passes, then slip inside before it closes, and watch the lever inside as it comes back. The "kick" of the lever, coming just about at the height of the knee, and the sudden alarming swing of the door itself have been responsible for careless men sustaining broken legs and broken heads.

This fact shows that this type of door does not open slowly and gently. On the contrary, the process is extremely rapid and abrupt. At the moment of touching the lever, the car, running easily on the rope, seems actually to stop, but as the rope travels on, the pressure exerted by the car on the lever rises rapidly, until the door is flung against the lever, which draws it open.

⁂

Extracts from a Superintendent's Diary

Occasionally I take a day or two off and travel forth to see what my neighbors are doing, and how they are doing it.

When I was young at the superintendent's game I felt that every minute of my time belonged to my company and nothing could induce me to leave my work; as a result I soon got into a rut. Fortunately for all concerned, our manager took me in hand before it was too late and gave me a broader vision.

Such trips not only keep me out of the ruts, but do as much for the men under me. I find that if I am on the job constantly, certain subordinates depend too much upon my suggestions in making decisions and in time lose their initiative. Naturally, then, if I get into a rut they follow. If they are left to themselves now and then, however, the effect is almost magical. When I return I find that they have taken things into their own hands, which is exactly what they are paid to do, and the company gets the benefit of their experience, which it very much needs.

The receptions which I receive at the various camps differ considerably, and this uncertainty adds to the pleasure of each adventure. Some superintendents are willing and anxious to compare methods, cost sheets or any other phase of their activities, while others seem to think that their directors desire the strictest secrecy, and when one attempts to draw them into conversation they become as uncomfortable as if they were sitting on pins and needles.

Today I paid a visit to a camp presided over by a superintendent of the taciturn variety, and just because I happened to be in the right mood I kept him squirming most of the time.

During the past two years the coal-mining companies of this state have been trying to get together on some plan that would insure a more permanent and equitable system of taxation. A few companies (the company that owns the mine that I visited today being of the number) have refused to take part in the conferences because they have been able, by playing politics, to keep their assessment on a very low basis. Naturally they are afraid that a tax agitation might make matters worse for them instead of better.

I tried to draw that superintendent into a discussion upon the values of mineral lands in our state, but he dodged the questions that I put to him persistently and completely, and finally refused point-blank to be drawn into conversation at all. While he was dodging the questions I raised about values, etc., he kept trying to switch the conversation into other channels, and unconsciously he let slip a good deal of information that I was anxious to secure, which under other circumstances I would not have obtained.

Although men of his type are not common in the coal business, still I meet a great many mining superintendents who are so thoroughly selfish that they do not feel called upon to give to others the benefit of their experiences. If they tackle something new with disastrous results they keep the fact from their neighbors and leave them to find out for themselves.

Such men do not realize that in turning their backs upon their neighbors they also close their eyes to progress, and in time they must find themselves rolling along in a wide, deep rut that turns neither to the right nor to the left until it ends at a stone wall.

⁂

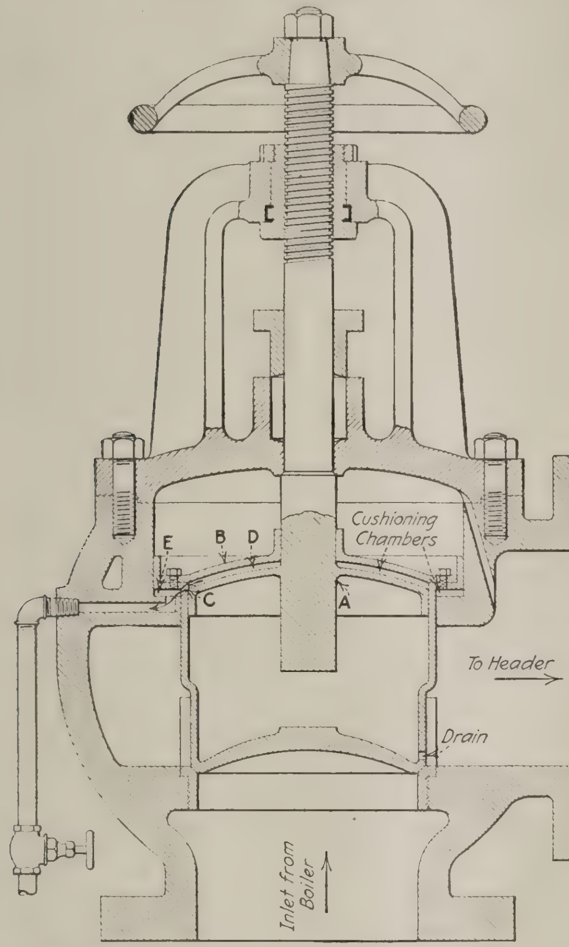
Improved Automatic Nonreturn Stop and Check Valve

The Golden-Anderson Valve Specialty Co., of Pittsburgh, Penn., has just placed on the market what is called its type B automatic cushion nonreturn valve, a cross-section of one variety of which is here shown.

It is well appreciated by steam-plant designers and operators that a stop or check valve should be placed in the discharge line from each boiler to the main steam header. This is to prevent backflow from the header to the boiler if the pressure in the boiler falls below that in the steam line. Such a valve is also useful when a boiler that has been out of service is being fired up and placed in operation, or when a pipe breaks, a tube bursts or a rupture of some other variety takes place in a boiler. In such an emergency a nonreturn valve in the steam line protects the entire plant, since the valve closes and will not permit the contents of the other boilers to escape through the rupture.

Furthermore, this type of valve placed immediately on the boiler nozzle or outlet will not permit the turning of steam into a cold boiler, and consequently acts as an additional protection for men working in it.

A double corliss dashpot method of cushioning is employed in this valve. This prevents hammering or pounding of the disk or plunger on its seat. There is only one moving part to the valve, the piston *B*, which is always in perfect alignment with the seat, regardless of the piston's position. When the steam pressure raises the valve *B*, the spaces *D* and *E* are instantly filled with steam, as well as the area about piston *B*, so that the valve is perfectly cushioned in opening and closing.



THE NEW VALVE SHOWING THE INTERNAL ARRANGEMENT AND THE SMALL VALVE FOR TESTING

These valves may be tested at any time desired without interfering with the operation of the plant. To prove that they are operative and would respond instantly in case of accident, the small valve in the steam line shown in the drawing may be opened. This valve, which may be placed at any convenient point, connects with chambers *E* and *D* and acts as a pilot valve, the opening of which closes the automatic valve. Closing the small hand valve reopens the nonreturn valve. This feature enables the attendant to determine at once whether the valve is in working order. It is not necessary for him to climb on top of the boiler to close or open the nonreturn valve by means of a handwheel.

These valves are of heavy construction and are correctly designed and properly finished. They are guaranteed not to chatter, hammer or stick, and to be positive, durable and economic. They are made in three general types—elbow, angle and globe—of cast iron, semisteel or cast-steel body and bonnet, with bronze, nickel bronze or monel-metal contact faces.

Pages from a Miner's Notebook: Toll of Goodfellowship

A young fellow was fired today. He came here several months ago, a promising sort of boy—he is scarcely twenty-four—and got a job helping on a machine. He was energetic and willing and for the first few weeks performed his work capably and to the satisfaction of the mine foreman. But he got in with the wrong crowd.

There is a bunch of young fellows here—machine runners and helpers and motormen, single men staying at the hotel—who find in the conviviality of the saloon their recreation. Some of them can afford to spend their money freely, and some of them have constitutions that can stand the work in spite of the drink-destroyed tissues of the body. This boy could do neither.

His work suffered. His place on the machine was taken by another man, a Slav, much to the disgust of the runner, who claimed he had rather have a "good fellow" for a helper than a "surly dago." But despite his objection he must realize that he is cutting more coal since the change. The boy was given a chance on the motor and for a time it looked like he would make good. But his first pay started him again on the "goodfellowship route," and in another 10 days he was taken off the motor and put to cleaning track. He was then a common laborer in an unresponsible position.

During the day, when all was activity about him, he stood up to his work, but a breakdown forced a number of men to the night shift, he among them. The first few nights passed all right; but his was not one of those constitutions which can stand a night's work after a day's carouse with other good fellows in the saloon, and in a few nights his work dropped off.

Last night he was found by the pitboss asleep. Nature will not stand abuse from even the princes of goodfellowship. The tired nerves and muscles demanded a rest and took one.

He was given his time, and to put the crown on his reign of good fellowship it was found that his time check was not sufficient to meet his board bill. He explained his predicament to his friends in the saloon, but they only laughed. The manager of the saloon offered him enough to pay his fare to another camp.

He was a good fellow. He was also a man. He learned in that hour the price of goodfellowship, and like a man he went to his boarding house, explained the situation to the motherly old lady with whom he boarded, offering to send her the money due her as soon as he obtained employment—almost cried when she told him that would do—and a few moments ago disappeared over the hill with his little bundle of pit clothes on a stick over his shoulder—walking, walking with eyes straight ahead toward the nearest camp 12 mi. away.

As I passed the office I heard the superintendent at the telephone asking the superintendent of that nearest camp to give the boy a job if there was any possible chance. "I believe he'll keep off the primrose path from now on if he is given a chance," said the superintendent just before he hung up the receiver.

Dangerous Wiring in Mines

By H. J. Johnson*

I have read excellent articles at different times on safe methods of mining, but I have not seen much about mine wiring. Under certain conditions, which I shall try to explain, electricity is dangerous in mines, especially where gas is encountered in considerable quantities.

To make my position clear, I will start at the bottom. First, what is electricity? Any textbook on this subject will say in effect: "We do not know what electricity is; we only know the effects due to it and the laws which it follows." The law of water flowing through a pipe is analogous to that of a current of electricity flowing along a wire.

Take for illustration a tank filled with water, located on the top of a mountain, with pipes leading from it to dwelling houses in the valley. If we set a bucket under a spigot in one of these houses and turn the spigot on, the water flows with considerable force and soon fills the bucket. Now, suppose we place an obstruction in the pipe between the tank and houses, and then turn the spigot as we did before. The water will flow slowly and the bucket will be long in filling, due to the resistance offered to the flow of the water in the pipe.

Now, consider the flow of an electric current along long lines of trolley and machine wire in mines. It takes pressure or voltage to force the current along these wires. Ohm's law states that it takes 1 volt to force a current of 1 amp. through a resistance of 1 ohm.

Let us see how a great number of mines are wired today. We connect a feeder cable to a circuit-breaker in the power plant and set this breaker to carry the entire load of the mine, consisting of haulage motors, coal-mining machines, pumps, etc. We then connect this feeder to the trolley wire at the mine entrance and run this trolley wire for a mile or more underground, connecting to it machine wires, pump wires, etc. Some of these conductors are small and have a high resistance. Furthermore, track-bonding is none too good in mines.

Suppose one of these machine wires should fall and cause a short-circuit. The resistance of the wires, combined with bad track bonding, would cause the voltage to drop so low that it would not allow enough current to flow back and trip the circuit-breaker at the power plant. I have seen coal-machine cables short-circuited and catch fire, and the machine helper compelled to run down to the heading and pull his cable off the heading wire. Had this room contained dangerous gas there would probably have occurred an explosion.

I have seen a cable burn completely while coiled on its reel. The current was cut off at the power plant, due to a breakdown, and the runner, learning that it would be off for several hours, went home, leaving his cable connected to the heading wire. When the current was turned on again, this cable short-circuited from some cause and burned together with the wooden frame of the reel.

This mishap was the result of having a high resistance line and bad bonding on the return rail. The voltage was reduced so low that it could not force enough current back to the power plant to trip the circuit-breaker. If there had been gas in the mine it might have been blown up and no one would have known the cause.

The remedy for such conditions is to have a magnetic, low-voltage switch installed on each machine and pump line, so as to protect that particular circuit. The use of open faceplate starting boxes for pumps and mining machines, as well as the employment of open motors in gaseous mines, should be avoided, since a spark from either may cause an explosion.

While we may not have an explosion from these causes, the unusual happens sometimes and proves disastrous. An example of such an occurrence was the New York subway accident of a few months ago, in which as the result of the short-circuiting of a cable about two hundred persons were injured.

Car-Operated Mine Door

By M. M. Haley*

This door is composed of two distinct parts or shutters which stand with ends exactly opposite each other when in a closed position. When opened by either train or

Ballads of a Coal Miner--VII

Written Expressly for Coal Age · **The Explosion** · *By* Berton Braley

FORTY *dead—an' mebbe more,*
Though the special rescue corps
Fought in fumes that burn an' choke—
Fought in gases an' in smoke,
Fought with all their strength an' breath
In a losin' fight with Death.

Forty dead: Good men an' true
On the job they had to do,
Killed 'way down there in the murk
As they done their daily work.

They was soldiers, sent to fight
Nature, an' to bring to light
Coal that moves the world along—
Soldiers brave an' soldiers strong,
Soldiers that to death was hurled
In the service of the world.

It was fate that they should die? Well, I sort of wonder why.
You kin talk to me all day, but when you git through I'll say,
"Forty dead: Good, sturdy men," an'—I'll ask you "Why?" again.

man the shutters take on a parallel position extending in the same direction as that in which the force is applied. The door is in the entry through which the electric locomotives travel to and from the parting. Regarding the speed of the train when passing through I believe 5 mi. per hour would be safe.

When a car bumper or locomotive strikes the buffer block *b* near the bottom of the door, the shutters open, at the same time pulling on the closing cords *c* on one side and slacking off on the other side.

The 16-lb. steel rails *r* are spiked in the middle on their sides to the joint post *j*, while a small turnbuckle connects either end (Fig. 2) to the bell-cranks *a*, from the other arms of which the cords *c* extend to the shutters. The ends of the spring rails rest on the stop blocks *l*; this insures a constant and steady tension on the shutters.

The armor plate *m* is placed at the proper elevation to strike the bolts and irons on the car bed and thus protect the door.

Fig. 3 shows how the space for the trolley wire is taken care of at *x*; while in this figure *c* indicates I-bolts for the pull rope connections. The bell-crank post *v* and the hinge post *j* are spaced and tied at the top by the stringers *k*. Brattice boards *w* (Fig. 3) may be placed on 2x4 in. studding on the outside and be made flush with the hinge post *j*. The shutters are made of 1 in. boards nailed at right angles, while the hinges *z* are made of ½x2½-in. iron and 7x¾-in. I-bolts with ¾-in. pins.

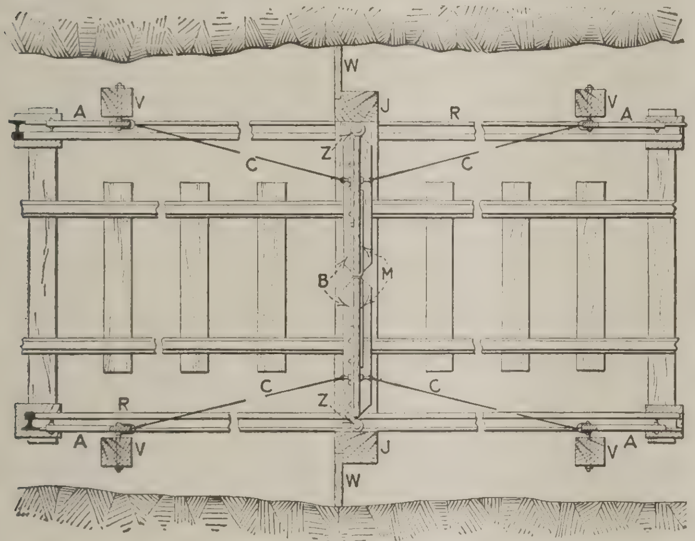

FIG. 1

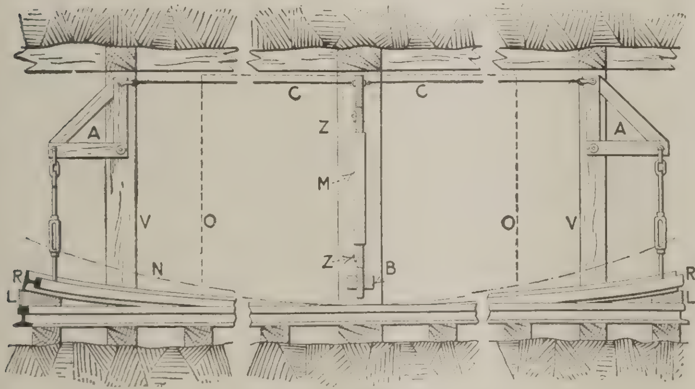

FIG 2

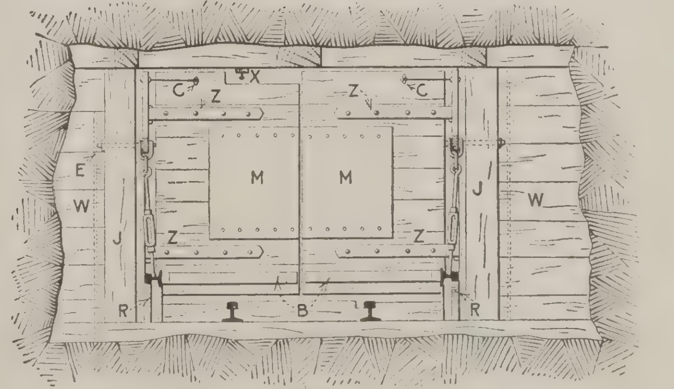

FIG 3

FIGS. 1, 2 AND 3. SHOWING ARRANGEMENT OF DOORS, CABLES, POSTS, SPRING-RAILS, ETC.

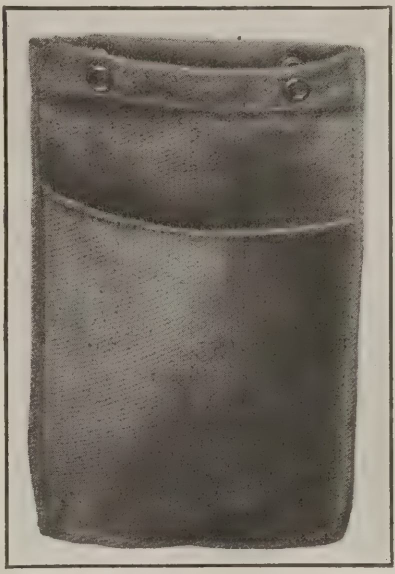
All openings around the door can be closed with tarred brattice cloth, with its edges nailed at dotted lines *e*, (Fig. 3). The arc *n* (Fig. 2) shows the position of the spring rail *r* when the shutters are opened full width, while the dotted lines *o* indicate the edges of the shutters when in this position.

This door is cheaply constructed and can be put together by any mechanic who can drive a nail. The necessary material also can be easily secured around any coal mine.

⁂

Bags for Dynamite and Fuse

Wallace McKeehan, safety inspector of the Copper Queen Consolidated Mining Co. and a leading member of the American Mine Safety Association, with the approval of the central safety committee of the company, recently designed the bag here illustrated for the carrying of powder and fuse. The sack is made of heavy jute and is sewn with flax thread, so that it is exceptionally durable. From 50 to 70 sticks of dynamite can be carried in the bag proper, the fuse being placed in the outside pocket. Large brass eyelets are fastened into the top of the sack for convenience in handling and carrying. It was noted by the management of the Copper Queen mines that all dynamite when handled in quantities of less than a box was carried in any way which would suit the convenience of the miner, it generally being tied together with a piece of fuse. Capped fuse was carried in the miner's hand or wrapped around his hat or thrust loosely in his shirt front. All these methods were exceedingly dangerous, and since the bag has been introduced these bad practices have ceased. The sack is made by the Bemis Bros. Bag Co., St. Louis, Mo., and sells for 35c. in 100-bag lots. The size of the bags is 15x22 in. outside measurement.



BAG FOR EXPLOSIVES

The Labor Situation

SYNOPSIS—Anthracite operators fear that they cannot transfer any large rise in wages and charges from producer to consumer because of competition of bituminous coal and coke. In the Hocking Valley district the miners are beginning to realize that their agreement of July 3, 1914, will have to be obeyed. John D. Rockefeller, Jr., visits his miners and has a good time, but lady politicians and the organization are yet likely to spoil his trip. He declares for the open shop.

The anthracite operators do not feel that they are masters of the situation and doubt very much whether they will be able to make the necessary increased charges to the consumer if they should accede in full or in any large degree to the demands of the miners. It is certain that of late years bituminous coal has been proving an important rival in the market, because the power houses have learned how to use it without making sufficient smoke to draw down official reprobation. In fact it has generally been noted that New York City air has not the clarity it once had because of the extensive change from hard to soft coal.

Of What Value is a Hard-Coal Operator's Fiat?

One of the anthracite operating heads has been interviewed by the Wilkes-Barre "Times Leader," and while he is apparently willing to concede that an increase of wage is indicated by the increased cost of living he is strongly against such wage advances as the miners demand. He declares that the price of anthracite is not determinable, as some think, by the fiat of the seller, because byproduct coke has weakened the market. He says:

"Coke has become the great competitor of anthracite. By the Solvay process it is not only possible to market coke, but the ovenmen can break it down, crush it and then press it into prepared sizes similar to those in which anthracite is delivered to the market.

For example, in the city of Rochester alone the sale of hard coal has declined 30 per cent. in the last three years. In Chicago, Cincinnati, and other cities, formerly heavy users of anthracite, that fuel is being rapidly displaced by coke. In those commercial centers bituminous coal is used for gas, and the coke, which is one of the byproducts, is marketed for a low price. Our company has lost sales in New York State amounting to thousands of dollars because coke has been substituted.

"In Syracuse or Rochester the cost of anthracite is about $6.75. These coke people have gone to users of our product offering coke for $5.50 a ton. They also guarantee that it will show as great or greater efficiency as fuel, far less ash than anthracite and no smoke. They establish a personal service, much as the automobile manufacturers have done. When a man buys their coke they give him a booklet of instructions telling him how to burn it. Then the agents call later and note the efficiency obtained. If too much has been burned, steps are taken to correct the fault. This supervision of the purchase continues until such time as the former buyer and user of anthracite is convinced that the substitute is as efficient as coal. With vastly cheaper cost there is only one answer: We don't sell him any more anthracite."

The operating head then goes on to state that the opposition to the Coal Tax Law was based on the fact that the anthracite producer felt that he had lost his grip on the market and could not continue to sell his product if the cost of it were unduly increased.

Hocking Valley Operators Hold Miners to Their Promise

To remove any misapprehension as to the standing of the Hocking Valley operators it would be well to quote in full the clause in the agreement inserted by them when the contract was made on July 3, 1914. This clause was given full assent by the miners and is binding on them morally and has as much legal force as any contract can have which is made with an unincorporated association. The clause to which reference has been made is: "The operators in accepting the miners' proposition of this date do so with the understanding, and upon the representation of the United Mine Workers of America, that the scale of rates and the conditions are to be made to apply to all subdistricts of the state."

Even union officials concede that in order to induce the eastern Ohio operators to agree to the scale rates imposed on all operators in Ohio, concessions in the "conditions" under which the mines were conducted were made to the eastern Ohio operators.

The miners in the Hocking Valley are beginning to realize that they must concede these "conditions" to the operators, and a meeting of subdistrict No. 1 of the United Mine Workers of America was called to meet at Athens on Monday, Sept. 27, by Sanford Snyder, president, and Conrad Wein, secretary-treasurer of the subdistrict.

This meeting was called to discuss the demands of the Sunday Creek Coal Co. It is said that the members of the union are urging their officials to make the concessions demanded. The miners in the Hocking Valley and their families are much impoverished, and ways and means of relieving the destitution will also be discussed. There are approximately 8,000 miners in the subdistrict.

The Ohio Utilities Commission has postponed its hearings on the coal-freight rates. They were to be resumed Oct. 5, but upon the application of the railroads they have been postponed until Oct. 12. In the meantime the experts engaged by the commission are continuing the work of examining the books and documents of the Hocking Valley Ry. The books of the Toledo & Ohio Central Ry. will also be examined.

Miners Are Siding with Operators in West Virginia Just as They Did Recently in Ohio

The increase in freight rates proposed in West Virginia is making much stir throughout that state. The labor unions are strongly opposing it. Local Union No. 2925 at Coal Fork, W. Va., has passed resolutions against the increased rates. Thomas Haggerty, executive board member of the United Mine Workers of America, openly denounces the increase. In fact the union in West Virginia is solid with the operators of that state in condemning the change in railroad rates which has been made to please the union and operators in the State of Ohio.

Mr. Haggerty's remarks are interesting and would have an immense validity were it the duty of the United States Government to see that the miners in any one part of the country could compete with those everywhere else. His argument could be fortified by taking the freight rates to the States of Washington or Colorado, and he could then prove that the miners of West Virginia would have to work for nothing or less than nothing in order to enter the Western market.

He says: "If the new railroad rate is put into effect the Kanawha and New River fields will be forced to close down altogether, but the Fairmont, Guyan, Big Sandy and northeastern Kentucky fields might be able to pull through because of their low production cost. None of the last-named sections have been organized and the men are compelled to work for a mere pittance. If the railroads achieve their purpose we never will be able to unionize those fields, because the production cost will be so great it would be an economic impossibility to get a wage increase.

"In the Kanawha field the limit already has been reached. The operators here now have to carry at least a 4c. net differential to compete in the Western market. If anything was added to that they would have to suspend operation. The cost of undercutting and loading coal in the Pittsburgh bed of Ohio is 47c. per ton. Here the same cost is only 32½c., and adding the 25c. differential gives a total charge of 57½c., leaving a net differential of 10½c. in favor of Ohio. In No. 5 seam the undercutting and loading cost is 27c. per ton, to which must be added the 25c. freight differential now in force. This makes No. 5 coal cost 52c.; while that in Ohio is only 47c. No. 2 gas coal is mined and loaded for 26c. per ton, and when burdened with the freight differential costs 51c. So even in this case also there is already a differential of 4c. in favor of Ohio.

Miners Want the Operators to Combine to Raise Prices

Mr. Haggerty announced further that the international executive board of the United Mine Workers of America, at its annual meeting in Indianapolis, appointed a committee composed of John T. White, Frank Hayes and William Green, president, vice-president and secretary-treasurer respectively of the union, to appear with the representatives of the operators before Congress next winter to secure an amendment to the Sherman law, by which the operators may be allowed to combine and ask for a price for coal which would guarantee better wages to their workmen.

An attempt is being made to show that the railroads in Ohio will lose in business more than they will gain by the increased rate, but they will console themselves by remembering that it will not hurt them as much as would a 15c. drop in the freight rates in Ohio, which appears to be the alternative. In all probability the increase in West Virginia will stave off the decrease in Ohio, as the railroads purposed when they asked for an increased rate.

There is a threat to bring Ohio to terms by putting a heavy tax on West Virginia gas. This would be only another gift to the Ohio coal producers and another blow to the West Virginia operators and population. An embargo or an export tax is always an unfortunate form of revenge.

Speaking at the Rotary Club in Zanesville, T. A. McIntire, a wholesale coal dealer, said that Columbus is using 70 per cent. of outstate coal, Newark 43 per cent., Cincinnati 92 per cent., Dayton 78 per cent. and Cleveland and Toledo 82 per cent. In 1911 75 per cent. of the coal hauled by the Pennsylvania R.R. was Ohio coal. Now less than 25 per cent. is from that state. In that same year 43 per cent. of the coal carried by the Baltimore & Ohio R.R. was from Ohio, and now 98 per cent. of the coal comes from other states. Ohio was third in coal production in 1911 and now is fifth.

The Mound City Coal Co. at Moundsville, W. Va., has been idle since Sept. 15, being apparently unable to pay its men for lack of funds. The men have engaged J. Howard Holt as counsel to bring proceedings in bankruptcy.

Order of Court Permits Miners to Pay Check-Off to Anyone

An order of the court in the case of Thomas Cairns, president of District No. 17, against the Boomer Coal and Coke Co., has been entered upon agreement of all counsel. It provides that the check-off be paid to W. L. Wehrle, who is appointed a special receiver for the court. It further orders that any miners who may have heretofore authorized the Boomer company to check off money from their pay for the use of the union, may by written request withdraw that authorization for any union dues which may be, or which now are, collectible. Moreover, it gives the miners the right to have future collections for the check-off paid to themselves, or to such persons as they may severally designate. This right can be secured by an employee on written application to the Boomer Coal and Coke Co.

Apparently the miners in District No. 30 have won everything but their rights to what they have already paid. They are free to subsidize any organization they please from the present date onward. .

In Iowa a coal miner whose leg was broken and back injured is trying to have 300 times his average working-day wage taken as the basis for his compensation. Senator John T. Clarkson, of Albia, is representing him. H. H. Stipp, the attorney for the coal company, is urging that, as the mines do not work through the whole year, a fifty-second part of the whole yearly wage should be the basis for figuring the monthly compensation. Richards, the plaintiff, worked only 224 days last year.

Mr. Rockefeller Declares in Favor of the Open Shop

As stated in last week's issue of "Coal Age," John D. Rockefeller, Jr., visited his employees in Colorado, and on Sept. 22 reached the village of Sopris, where he interviewed the children in the model school. At that same town Mr. Rockefeller inspected a number of disreputable houses built on the Colorado Fuel and Iron Co.'s ground by foreign miners. These the company purposes to buy and tear down, but the officials expect there will be some trouble, as the owners like to keep possession of their sad quarters, where the ground rent rarely exceeds a dollar a year.

At the same time the company feels that the presence of these unfit dwellings is discreditable to them and not to the advantage of their men, and they are determined to oust the tenants and replace the hovels with decent dwellings. After a visit to Morley and Starkville, the party returned to Trinidad and the trip to the mining camps was complete.

Everywhere he went Mr. Rockefeller was well received, the only displeasing event being an attempt on the part of a negro to talk him to death. On the 24th Mr. Rockefeller was at Pueblo going through the big mill and later he went through the company's hospital at Minnequa with Dr. R. W. Corwin, the white-bearded chief surgeon.

But the furies are following Mr. Rockefeller. The president and secretary of the Women's Justice League of Denver have met him and want him to meet the union officials. Mr. Rockefeller declares he is willing to meet anyone, but he has declared strongly for the "open shop." W. L. Mackenzie King, who is accompanying Mr. Rockefeller, has stated that the company is willing to meet its employees and arrange the terms of employment. He has declared that no discrimination would be made against the United Mine Workers, but he insists that the company will not recognize the union.

Ventilating in Rescue and Other Work

In *Coal Age* of Feb. 10, 1912, was published an illustration of an Austrian device for approaching mine fires—a collapsible air duct which could be strung from the roof and by which the foul air of combustion could be drawn away.

Of course given a slow fire and strong draft such as should be obtained by a small fan, an air duct of this type could be laid on the floor and would give satisfaction. Such a duct can be made of the "Flexoid" tubing manufactured by the Bemis Bros. Bag Co. The tube is made of heavy canvas reinforced with a composition which is forced into and becomes part of the texture of the goods. The usual sizes are 10, 12, 16 and 24 in. in diameter and from 100 to 200 ft. in length.

One man can carry a 100-ft. section on his shoulder. He can unload it wherever needed and then rapidly unroll it. It could be used not only in cases of fire fighting but also in rescue work. The recent tunnel driving at Archbald, Penn., through a rockfall to bring out four entombed men would have been more rapidly and healthfully performed had some such return been provided.

In many places it is necessary to drive ahead of return airways using air boxes, and they are often extended without any suitable means of securing ventilation. These tubes provide a speedy way of coursing the air, and one which can be readily dismantled for firing and renewed as soon as the blast has been fired.

The tubing is so air-tight that it has been used for temporary water diversion in bridge and culvert work. It is also furnished flat in large sheets for covering newly placed concrete. When the turbine is made to pass a sharp angle a few wood hoops will enable the pipe to be kept wide open, but on narrow turns the draft if reaching 3 in. of water gage will fully provide for this necessity. It is said that air can be delivered with a gage of 3 in. a distance of 1,600 ft. away from the blower, and the large sizes of pipe are delivering 10,000 cu.ft. of air.

Like many other devices used in the mines, Flexoid was first developed for use on the surface. Thomas Connor & Sons, of Greensburg, Penn., were constructing the Mill Creek sewer and the firm took up the matter with the Bemis Bros. Bag Co., of St. Louis, Mo., and the flexible conduit was the outcome. The cost of the duct is only about half that of galvanized-iron pipe, and being smooth and slick inside, air travels readily along it.

If the duct is crushed by a fall of rock or coal it will readily correct the deformation as soon as the weight is removed. A metal conduit will not do this. Moreover, a Flexoid conduit can be patched with needle and thread, whereas the repair of a severely dinged metal air duct is injured beyond any such renovation. Even if a metal duct can be straightened, the work takes some time.

Air ducts like these can also be used in shaft sinking. The need for temporary air conduits in many places has long been apparent, but as the methods provided are so cumbersome the tendency has been to put up with bad air, its risks and unhealthfulness rather than submit to the inconveniences involved in temporary provision for air coursing. The use of the Flexoid duct may hereafter make unnecessary our present masterful practice of watchfully waiting on nature.

Do Safety Methods Succeed?

Increasing the number of men in a mine introduces a new risk, and for this reason there are occasional doubters as to whether the many safety inspectors will prove the value of their services. The late Fred C. Keighley used to tell one of his own unfortunate experiences in promoting safety. He was afraid his headings were too narrow and that some driver or workman would be pinched in the roadways, though they were by no means as constricted as might be found elsewhere. He had the work of widening almost done when the roof fell while one man was taking a side cut in a heading, and the very fact of securing safety added to the toll of victims.

It is therefore refreshing to hear about the successful campaign of the Susquehanna Coal Co., as related last Saturday by General Manager R. A. Quin at the Edgewood Park Meet of the Susquehanna and the Lytle concerns. The companies have 200 rescuemen drilled in the use of breathing apparatus, 325 first-aid men, not including those who after training have been advanced to higher position; 50 safety inspectors employed by the company to provide for the protection of their men and 475 persons employed as foremen and assistant foremen and in like positions, whose duties while partly economic are first and foremost to seek safety.

Roughly there are 1,000 men employed to save lives and 13,000 men to be protected. Mr. Quin declared that as a result of the renewed effort to guard their men from danger the fatal accidents in the first eight months in 1915 were only 17, against 32 in the previous year. He regarded it, as indeed all must, as a full recompense for the time and money expended.

It will be seen that there are 50 men out of the 1,000 whose sole work is safety. The lowered death rate is probably almost wholly their work, as the first-aid and rescuemen and the foremen of all kinds were as numerous a year ago as now. A saving of the lives of 15 employees by adding 50 men to the force is a considerable achievement, and it results largely from the fact that the men are as keen for safety as the company. The spirit has permeated through the collieries.

Morris Williams, the president, drew attention to the fact that safety-first, first-aid and workmen's compensation were achievements of the last ten years. The movements would have been declared chimerical a decade ago. He himself could recall the day when a man had his leg broken in a working place next to his own. The unfortunate miner was carried to his home by men who deemed themselves considerate. His bones grated on one another and his groans were frightful to hear. He was lowered down the breast and then loaded into a car, without any care. All sorts of mishandling were perpetrated by his well-meaning friends. It is different today, and the saving in life, in pain and in loss to the family and to humanity has been large.

As he said, the compensation movement is not less important. "Something which is the workman's right and always was his right," Morris Williams declared it, adding that it was "nothing but common justice." The future indeed looks bright. The spirit of the Susquehanna employees seems to assure us that none of the dreaded effects of compensation will be felt. Their willingness to do their part in safety-first and first-aid is a warrent that they will see that no man is compensated who does not need it.

⁂

Is Our Conception of Mine Discipline Changing?

Some years ago a rather prominent student of sociology, speaking of a certain class of American citizens, said: "In their pulpits much is said of truth, honesty and virtue, but they really have no adequate conception of the meaning of these words."

When a coal man turns from the pressing questions of cost, efficiency and mining methods long enough to dwell upon the refinements of mining you hear more or less about "discipline." Probably no other word has been brought more into requisition in the discussions of remedial measures for all mining troubles, especially mine accidents. The lack of discipline, to judge from the remarks we hear, is the source of almost all our woes.

In actual practice you will find men advocating treatment of the miner varying all the way from serving him his breakfast in bed to "beating his head off with a pick handle." We often hear it stated that we are not able to get the "old-time" discipline. Many sighs are wasted for the fleshpots of those glorious days when the whip cracked and every fellow jumped. We are all about ready to admit that there has been a rather rapid breaking down of the thing we used to conceive as discipline.

It is a pathetic spectacle to see our old men of iron, with a few faithful old employees around them, striving to beat back to the standards of the early days. They probably feel that with the coöperation of their neighbors the tide might still be turned back. Perhaps. But their neighbors are newcomers, who think they have read the signs of the times correctly—the times when concession, compromise and defeat are reckoned with and the half loaf is not spurned.

With our National Industrial Commission disagreeing, and our former Secretary of State declaring that old systems of force have passed, those who employ men are frequently inclined to take stock of their individual fitness to survive. A man who has not physical courage is apt to vote for a system in which the minimum of that quality is required; but physical courage is still the mainspring back of all successful discipline, and always has been.

However, there is another quality—perhaps rarer in its combination with "nerve"—for which the present-day disciplinarian of mining men needs to search himself diligently; that is the willingness to risk a misinterpretation of his reservations pending the adjustments to the standards which the great public seems to be demanding. True, the only way you can prove that you will fight is to fight, yet there is some merit in being willing to withhold the proof. It cannot be denied that there is a general leaning toward the old "fight-at-the-drop-of-the-hat" conception of a successful disciplinarian; hence, because not much of that is done now there is a general feeling that we have no discipline.

If the old-time discipline is gone, what has become of the "punch" that went into the make-up of the old-time disciplinarian? One theory is that it has been "cast out" of the bosses by repression and has "entered into" the men. Anyway, anything like discipline according to old standards seems to require a higher order of nerve than ever before—a nerve that is able to get results while withholding the ocular proof of its existence.

While making inquiry after the "punch" that seems to have departed from the old order of things, how about the word "obey"? Perhaps if the conception of the meaning of mine discipline is changing, it is due more to the breaking down of the one vital element of discipline—obedience. The word has even been taken out of the marriage contract, and has become entirely bookish. We scarcely hear it any more, unless at a church service.

Is there any analogy between the industrial war that has been going on for some years and the European uprising against "militarism?" Is the leaning of labor toward the Allies any indication of this analogy? The old guard among the coal operators may resent their conception of discipline as being termed "militarism," but the press in some localities is even calling it "feudalism." Now the men who are trying to "meet the situation" find themselves wondering just what intermediate position they are to take in order to get that much-coveted condition spoken of as mine discipline.

The Department of Mines in one state, in its annual report and over the signature of its chief, says: "Strict discipline, vigorously enforced by the mine officials, would reduce the number of accidents at least one-half." Some time afterward a deputy inspector was examining a mine in company with the superintendent. A miner was discovered shooting off the solid in violation of law and was not prosecuted. At another mine the inspector made a report to his chief, stating that more than the legal number of men were being taken up on a hoist. The general manager, seeing the report before it was sent in, was indignant and addressed the deputy inspector as follows:

"All my employees have been instructed in the law in regard to the number permitted on a trip. This law has been incorporated in my mining rules and posted at the top and bottom of the plane. My superintendents and myself have something more to do than sit and count the number of men who get on the trip each morning. If you have observed any violation, your duty is clear, make the arrest, or modify your report."

No arrest was made. Probably in this instance it could be shown that both inspector and manager took extreme positions.

A third instance, however, shows a little plainer why mine discipline may be undergoing a change. Another state inspector was making his rounds in a mine when a shot was fired that contained about double the charge that was permissible. He was "horrified" and said: "That man should be discharged." The superintendent promptly discharged him. A few days later the inspector made a special trip to urge the man's reinstatement.

As most of us understand it, the objection to militarism is not its efficiency but the tendency to make it paramount. However, it seems that anything like discipline must partake of the qualities of militarism—that is, authority and obedience. Hence, the question arises, Is there not a tendency to eliminate authority and obedience from discipline; and in any conception of discipline without these vital elements, has discipline itself not been wholly lost?

Continuing the analogy, has not the conception of coöperation had much to do with the breaking down of the old standards? Why does not discipline mean the same thing when applied to an army of industrial units as it is supposed to mean when applied to soldiers, namely, the recognition of authority and obedience? There seems to be a double opposition to militarism—the legitimate objection to an efficient soldiery dominating civil affairs and the tendency to oppose the elements themselves that make for military efficiency. Coöperation is certainly a concomitant of the other virtues of great orderly movements, but with the passing of the elements of discipline, coöperation, when applied to mining, often has come to mean the elimination of the old-time discipline and the substitution of a system whereby those in authority, or supposed to be, first ascertain whether an order will be acceptable to the men and whether permission is granted to issue the order.

But the question propounded in the beginning was meant to bring out the point as to whether those who have so much to say about discipline are hypocritical, or have they really some new conception of discipline, as a product of concession, compromise and yielding, with the authority, the obedience and the "punch" left out. I think we can look squarely at the proposition without too much repining. When we advocate mine discipline, do we mean the old thing or something else? Did the writer of "I Didn't Raise My Boy to Be a Soldier" write against the domination of a military class or voice a protest against learning too much discipline? And is the popularity wholly one of war issues, or could it mean "I Didn't Raise My Boy to Recognize Superior Officers"?

It would be a beautiful sight in going through a mine to see drivers and slatemen and miners, all rushing to help put on a derailed car (or possibly more beautiful to see the track in such shape that a car would not get off). What you are more apt to see is the whole heading tied up and a dayman hunting for the fellow whose job it is to replace cars. This man, when found, perhaps waits for a mule to haul a jack, which, but for the division of labor necessary to "coöperation" might be carried.

Still following the extremist's idea of coöperation, the mine foreman goes into a room where there is some bad slate. "Hello, John, you've got some bad slate here. I'd have brought a prop with me, but I left it with Joe." Joe having filled his car, drops in to see how John is getting along. "L'mme set it while you finish your car from the other side. There's one right back here." "I'll hold it for you," says the mine boss.

The mourner after the old-time discipline, reporting a similar occurrence, will state that it would actually happen about like this: "Here, are you trying to commit suicide? Put a post there" (marking the place). John, without looking up, answers sullenly: "There ain't been no posts here for a week." Mine foreman: "There are a dozen only a step back; you better set one." John (still shoveling): "Too short." Mine foreman (measuring): "Here are several just right. Don't wait till that falls on you." A half hour later the driver reports an accident in John's room. The foreman hurries in and finds Joe "coöperating" in getting a ton of slate off John's neck.

As is usually the case the truth lies between the two extremes indicated. The discipline which is going to obtain in the future, as a result of the changes now taking place, probably lies somewhere between a military conciseness and the coöperation of brotherly love.

Mine managers of the old school will never again see the old-time discipline, and the advocate of a coöperation without any "punch" may have to wait a while. In the meanwhile "nerve," "ginger," "pep" and "punch" are as valuable as ever, and every man who welcomes "denatured" discipline because it coincides with his own temperament is apt to command an article which will go a long way toward further changing the standard.

The pessimist may feel that the decline is tending toward anarchy, but the chances are that mine discipline never was quite what we remember it as having been, and if there is a world movement in which authority and obedience breaks down, it will cover more than one lifetime. Perhaps it is better to conduct a "masterly retreat" than to stand against overwhelming odds, but as between the last stand of the old guard and the inglorious rout of those offering an easy victory to anarchy, the choice should not be difficult.

Philadelphia & Reading Meet

SYNOPSIS—The "Reading" meet is a historical event, for the work of that corporation in first aid led all others in the United States. Drilling exercises are becoming popular.

The Philadelphia & Reading Coal and Iron Co. held its eleventh annual competitive drill at Lakeside Park, East Mahanoy Junction, near Tamaqua, Penn., on Saturday, Sept. 18. Emphasis may well be laid upon the ordinal adjective "eleventh," for no other mining company in the United States can lay claim to so long a period of first-aid activity as can the "Reading." The Pennsylvania Coal Co. and the Hillside Coal and Iron Co. are close competitors, but they did not hold their first meet till a year later. So the recent competition at Valley View of those two anthracite companies in the Luzerne field was only the tenth annual meet.

It is customary to say when attending an event of this kind that the work is better than ever every year. However, those who have followed the work of the teams at Lakeside Park realize that the Philadelphia and Reading miners early set such a fast pace that it is hard if not impossible to beat it.

Here of all meets is the best place to go if one would see model roller bandaging. This has been true for many years. This year some new developments have taken place, but they are not in the direction of new technique. The litter drill has been raised to an important feature, and setting-up exercises and military drills, while not performed under company direction, are being introduced with the approval of everyone.

The field used to be rectangular, but this year was made round, and the new shape had its advantages. In the center was a marquee, in which the records were kept, and a roped-off pathway led from this tent to the outer circle of the contest ground. In this way perfect order was maintained, which was the more necessary as the teams in the grounds were changed after every group of events.

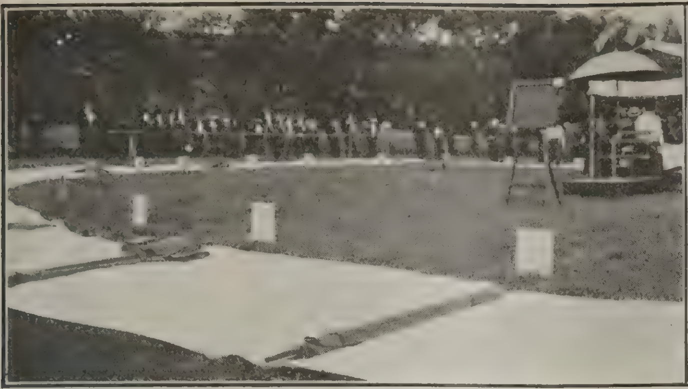
SOME OF THE NOTABLES PRESENT



THE FIELD WAS METHODICALLY ARRANGED SO AS TO PROVIDE THE UTMOST DISPATCH

THE MEN OF EACH DIVISION PERFORMED THE SAME EVENT IN ELIMINATION TRIALS

In one event the victim was supposed to be burned on the head, face, chest, arm and hand—a terribly severe case, one would imagine. However, the men with one accord sat the patient up when bandaging him, as if there was nothing to dread from shock. This is mentioned particularly because there are many meets where the dressing, in such a posture, of a patient so frightfully burned would be penalized heavily.

The officials of the American Red Cross and the American Mine Safety Association urge that a man whose heart action has been weakened by such severe burns should be laid at full length, so that his heart will be subjected to less strain. Those who take a contrary view state that a victim, if at all conscious, is always anxious to sit up and will struggle to do so, and if he does his heart action will be even more seriously affected. Moreover, the bandages are more readily adjusted on a sitting man.

Fracture of the spine was treated by some of the teams without the care which is generally exercised in such work. One corps was even observed with the patient partly doubled up prior to splinting. Still it must not be thought that lack of care was in any sense frequent. In most cases the teams were as careful to do the work in the right way as to secure a perfect result for the judges to view.

The various districts each drew a problem from among ten presented. This problem was then submitted to all the corps in the district. In order to save time, three districts held their competitions simultaneously. The winning corps in each district then competed in the litter drill, which took place after dinner, the evolutions being: Form corps; procure litter; open litter; close litter; proceed to patient, double time; place patient on litter, examine for and dress one injury; transport patient to ambulance and place in the vehicle; return to place of formation; dismiss. Time allowance, 12 min. At the completion of this problem the corps executed such other movements with the litter as they saw fit, an additional time limit of 5 min. being accorded.

Addresses were made by W. J. Richards, president of the Philadelphia and Reading Coal and Iron Co., and by Governor Oakley C. Curtis of Maine. The blue ribbon and pennants were awarded to the Brookside colliery team by Mrs. E. T. Stotesbury. Pine Knot, which was second, was beribboned by Miss Richards, and Wadesville,

A DRESSING FOR A FRACTURE OF THE SKULL AND INJURY TO THE EYE

SOME OF THE TEAMS HAD AN EXTREMELY NATTY AND PLEASING APPEARANCE which was third, by Miss Smith. The other seven corps which led their districts were North Franklin, Suffolk Inside, Alaska, West Shenandoah, Mahanoy City Inside, Draper Outside and Bast City.

Exhibition Drills Introduced for First Time

After the speeches and presentations some setting-up exercises were performed and also some drills. The miners in the "lower region" work mostly in high coal, and of course being in hard coal do no undermining. They are therefore not disposed to stoop or carry themselves like bituminous miners who undercut coal in low seams.

There are few miners therefore who need setting up exercises and drill less than these Reading employees. Still drill is a good exercise for anyone and the practice of it will undoubtedly add to the excellent bearing of the Reading first-aid men. The public judges a man by his outward appearance and nothing will make it revise its present unfair estimate of miners so much as squads of men with a military bearing such as the Reading bids fair soon to have.

Rescue and First-Aid Work in Southwestern Illinois.

Special Correspondence

SYNOPSIS—First aid and mine rescue form the leading events at the Pinckneyville, Ill., fair. The one-man event is an open contest, many of the individuals taking part in it representing only themselves, as is customary in athletic sports.

The first mine-explosion demonstration and the first-aid contest ever held in connection with the mines of southwestern Illinois were staged Wednesday, Sept. 22, at the fair grounds in Pinckneyville, Perry County. It was one of the attractions of the Perry County Fair.

This arrangement was made possible through the efforts of Thomas Jeremiah, one of the directors of the fair association and also a member of the Illinois Mine-Rescue Station Commission. He is one of the operator representatives in that body. The medals given as prizes were provided jointly by the Illinois Mine-Rescue Station Commission and the Perry County Fair Association.

DEMONSTRATION OF A GAS EXPLOSION IN A MINE

An imitation mine gallery, with five rooms leading from it, was constructed of timber and tar paper, the whole structure being 45 ft. long, 18 ft. wide and about 7 ft. high. To form this representation of a mine 20 rolls of tar paper were nailed to thin wooden strips. Another illustration shows the entrance to the gallery and the team from the Benton, Ill., Rescue Station wearing the oxygen-breathing apparatus and entering the mine. The door seen at the left of the illustration leads into a testing room, which was filled at the time of the demonstration with a dense smoke, and in this atmosphere the oxygen apparatus was tested before the men entered the mine. As a dense yellow smoke poured out of the door when opened it was evident to the watching crowd that before a person could enter the room some form of breathing apparatus was necessary.

Before the main demonstration an exhibit was made of what was supposed to represented the old-fashioned way of handling an injured person. The victim was trundled along in a jolting wheelbarrow to his manifest discomfort. This demonstration supplied the comic element that the public nowadays seems to demand even in connection with the most serious situations.

The mine demonstration began with the entrance of the day shift into the mine, instructions being given by the manager to each man as he entered. Another realistic touch was an altercation between the men in regard to the work to be done and the method of doing it.

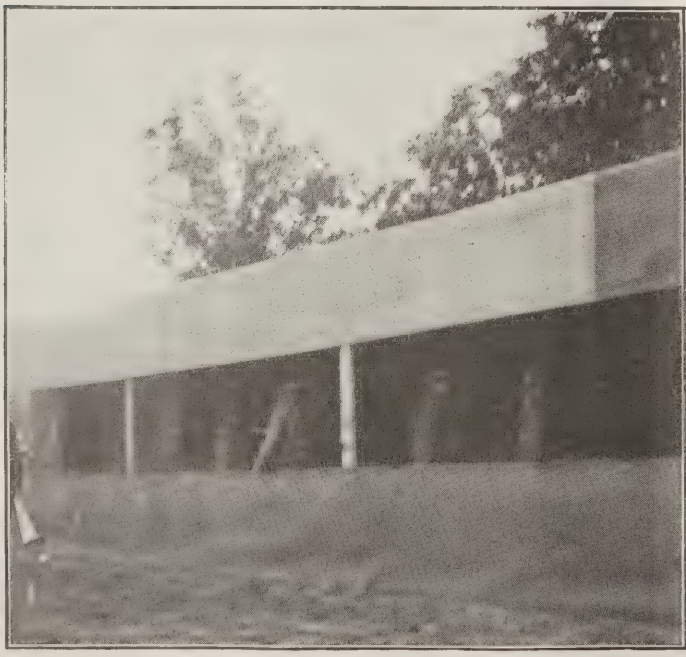
Soon after the party had entered an explosion was heard in the last room and word came to the manager still at the mine entrance that men had been injured by a gas explosion. He at once telephoned for assistance to the Illinois Mine-Rescue Station at Benton and in a few minutes an automobile dashed up bringing the Benton rescue team and supplies. An ambulance also soon followed.

The team quickly put on the oxygen apparatus and after testing it in the smoke room took its position along the life line and entered the mine, which by that time was filled with a dense smoke. Soon one supposedly injured man was brought out, followed closely by another, and both were placed in the ambulance and hurried to the hospital.

CONTESTS FOR TEAMS AND INDIVIDUALS

There were two parts to the first-aid contest—first, the team event, in which six teams competed, and then a one-man event, in which not more than two from each team were entered. In the latter individuals were also permitted to compete if not connected with any of the teams entering the former contest.

The problem given in the team contest was: Compound fracture of the left thigh; a wound 3 in. long in calf of right leg; a cut on the outer surface of the right forearm, with



AN IMITATION MINE FOR RESCUE DEMONSTRATION

MEN ENTERING THE MINE-RESCUE GALLERY

FULL-TEAM CONTEST

INDIVIDUAL EVENT

profuse bleeding. Treat and carry patient on an improvised stretcher a distance of 25 yd.

Ten minutes were allowed for the work. The competing teams were: Big Creek Coal Co., St. David; Wilson Richer mine, Pinckneyville; Mining Bureau of Inspection, Peoria; Producers Coal Co., West Frankfort; Majestic Coal Co. Du Quoin; Big Muddy Coal and Iron Co., Herrin, and Gillespie Independent First-Aid Association, Gillespie. The judges were Dr. G. F. Mead, of Pinckneyville; Dr. Byford Webb, of West Frankfort, and Dr. W. Daggert, of DuQuoin. The team from the Producers Coal Co., West Frankfort, won first place and the corps from DuQuoin and Herrin tied for second position. The problem given to break the tie was the treatment of a crushed pelvis. The Herrin team was awarded second prize and the DuQuoin team third.

In the one-man event there were so many contestants that it was necessary to take them in two divisions. All had the same problem, but, while the first division was contesting, the others were sent to a distant part of the grounds, so that they might not profit by observation of the methods of the first group. The problem given was:

Man has been struck by a fall of slate and his left ear has been torn off, a contused wound is found over his right eye, his scalp is lacerated and there is a wound 4 in. long on the right side of his head.

The time allowed for the event was 10 min. So close was the contest that three received the same mark for first place. To decide the event these three were given the problem: Thumb and index finger of right hand have been cut off, severe bright-red arterial bleeding resulting. Treat.

The winners of the event were: First, Burnett and Yuill, of Herrin; second, Nolte and Dunning, of DuQuoin, and third, Avoskee and Campbell, of Pinckneyville.

The local arrangements for the meet were made by James Torral, superintendent of the Benton Rescue Station, and Charles Swan, assistant in charge of the DuQuoin substation of the Illinois Mine-Rescue Service. The announcer of events was G. T. Powell, United States Bureau of Mines, Evansville, Ind., and the recorder was H. I. Smith, mining engineer, United States Bureau of Mines, Urbana, Ill.

The interest taken in the event by the miners, operators and citizens of Perry and adjoining counties showed gratifying appreciation of the first-aid movement.

⁂

A Disorderly Workshop contributes to the number of accidents. Do not leave waste around which may catch fire, or leave material lying on the floor on which people may stumble. Safe places should be provided for the storage of all supplies.

COMING MEETINGS

Fourth Annual Mine Safety Demonstration of the Ellsworth Collieries Co. will be held Oct. 12 at Ellsworth, Penn.

National Safety Council will hold its fourth annual safety council at the Bellevue-Stratford Hotel, Philadelphia, Penn., Oct. 19-21, 1915. Secretary, W. H. Cameron, Chicago, Ill.

Engineers Society of Northeastern Pennsylvania will hold a special meeting at its rooms, 415 North Washington Ave., Scranton, Penn., on Thursday, Oct. 28, 1915, at 8 p.m. The object of the meeting is to take corporate action on the proposed issue of $15,000 4-per cent. 10-year bonds, for the purpose of refunding the outstanding floating indebtedness of the society and furnishing money for its general purposes. T. F. McKenna is the secretary.

First Annual State-Wide First-Aid Meet will be held at Bicknell, Ind., Oct. 30, 1915, under the auspices of the local unions of the United Mine Workers of America and the operators of Knox County, the Bureau of Mines and the American Mine Safety Association. William Bogle, Bicknell, Ind., is the secretary.

United Mine Workers of America will hold its annual convention in St. Louis, Mo., beginning Jan. 17 and continuing for three weeks. William Green, secretary-treasurer, 1102-1109 Merchants National Bank Bldg., Indianapolis, Ind.

⁂

Next Week

The Oct. 9 issue of *Coal Age* will contain a number of safety and sociological articles that were crowded out of this special issue. We will also publish next week the first installment of a valuable article covering "Motor Haulage and Side Tracks in Coal Mines." No foreman, superintendent or manager can afford to miss this article. Other articles will deal with "Coal-Storage Plants," "Car-Supply Outlook," "Coal Mining by Longwall System," "Repairing Broken Tapes," "Accidents to Boilers at Coal Mines," "Trees in the Life of a Coal-Mining Community" and descriptions of the various first-aid meets held in the different coal districts.

Discussion by Readers

Explosibility of Coal Dust

Letter No. 1—I have been watching with great interest the discussions on the prevention of mine explosions and have wondered that some of the correspondents had not referred to the editorial published in *Coal Age,* Aug. 21, p. 303, entitled "Explosibility of Coal Dust." The editorial treats the question of why one coal dust is more easily ignitable than another. This is a most interesting inquiry, which is receiving the closest attention at the hands of some investigators who are trying to discover the probable cause of this difference in coal. Their method is to examine under the microscope thin slices of coal, in the hopes of finding important physical differences that would lead to a solution of the problem.

The editorial, however, deals wholly with the water content of the coal and refers suggestively to the report of David J. Price and Harold H. Brown, of the Millers' Committee of Buffalo. This report, which is entitled "The Explosibility of Grain Dust," seems to indicate that the corn dust, having the higher percentage of moisture, was ignited more readily than that with a lower percentage of moisture. That is to say, as the percentage of moisture increased, the temperature of ignition of the dust was lower. It is interesting to note that this corroborates the experiments of Prof. H. B. Dixon, which he performed some years ago when investigating the rate of explosions in gases. Professor Dixon at that time proved that 5 per cent. of moisture present, in the form of steam, in an explosive mixture of gas and air gave the highest velocity and the greatest pressure in explosions. Some correspondence had with Professor Dixon at that time, if my memory serves me, did not throw any additional light on this important matter.

Now, I believe that there is, in all probability, some difference between the effects produced by hydroscopic water when present in the coal and that produced by dampness or moisture accumulated on the face of the coal as the result of spraying, which is the common practice in many mines. I believe that most persons who have studied the matter will agree with the statement at the close of the editorial, to the effect that "though moisture probably is a protection, it is not an unquestionable guarantee of safety."

In this connection I was much interested in the article entitled "Scientific Humidification," by J. I. Lyle, *Coal Age,* Sept. 4, p. 378. In his summary at the close of the article, however, Mr. Lyle fails to state what weight of water vapor he considers should be present in the air to obtain the desired effect.

Considering this subject from a practical standpoint, there is no doubt but that the dust floating in the mine air may be greatly reduced with advantage by the use of sprays located at certain distances apart in the airways. Also, the method often adopted of spraying the cars of coal before they are hauled out of the mine should prove efficacious in reducing the accumulation of dust on the haulage roads and its suspension in the air current traveling in the mine. It is generally admitted that the humidification of mine air to the point of saturation is not desirable in the mine, as such a degree of saturation is not conducive to the health of the mine workers.

Taking all these facts into consideration, one is led to conclude that the humidification of the mine ventilating current does not increase the safety of the mine, except as it prevents the absorption of moisture to that extent from the mine workings, rendering them dry and dusty. On the other hand, the hydroscopic water in the coal assists its disintegration, and it may be reasonably inferred that coals low in hydroscopic moisture will not be as readily held in suspension as dust in the air current, and the mining of such coal might therefore be accomplished under safer and more sanitary conditions.

JAMES ASHWORTH,
Mining Engineer.

Vancouver, B. C., Canada.

Preventing Mine Explosions

Letter No. 9—As the winter season again approaches, the question of the best means of preventing mine explosions becomes of increasing importance. On this account I want to draw attention to the method adopted by the Powhatan Coal and Coke Co., at Powhatan, W. Va. It would seem from the results obtained that the form of humidifier installed at this mine has solved the dust question and made it possible to keep the mine in a safe condition at all times, as far as the dust is concerned.

When once understood, the method is exceedingly simple. By means of a radiator consisting of a system of steam pipes placed on the intake air current the air is heated to a temperature higher than the temperature of the natural strata in the workings. In the use of this apparatus steam is injected into the air after the latter is heated by passing over the pipes. The heated air is able to carry a larger amount of moisture than would otherwise be possible, and while in this condition absorbs the steam as it issues from the ends of the pipes. No more steam is permitted to escape from the pipes than the air current will absorb. This is important in order to avoid the formation of fog in the entry beyond.

As the warm moist air comes in contact with the cooler walls of the mine a portion of its moisture is condensed, and the air flows through the workings in a saturated condition, which prevents the further absorption of moisture from the mine workings and the drying out of the mine. It is well known that an air current of 100,000 cu.ft. per min., when fully saturated at a temperature of 0 deg. F., will carry slightly less than a gallon of water as absorbed moisture, and each rise of 20 deg. approximately doubles the carrying capacity of the air. [At an average mine temperature of 62 deg. F. the capacity of air for carrying moisture is 12 gal. per 100,000 cu.ft. per minute.]

Inasmuch as most coals contain less than 15 per cent. of moisture—and, I believe, it has been shown that an explosion due to the ignition of dust floating in mine air is possible when less than when 30 per cent. of moisture is present—it would seem that every practicable means should be employed for maintaining a high percentage of moisture in mines in order to reduce the possibility of an explosion from this cause to the lowest possible limit. In the humidification of the intake current passing into a mine it is evident that this must be effected at a temperature, as I have mentioned, higher than that of the natural strata in the mine.

The humidifier that I am about to describe has been installed and is in successful use not only in the mines of the Powhatan Coal and Coke Co., at Powhatan, but also in those of the Lynchburg Coal and Coke Co., at Kyle, and the Eureka Coal and Coke Co., at Eckman—all in this state. It is not claimed that this arrangement is new, having been installed in these mines for a number of years. At the time of installation the tests made by Walter Proctor, a mechanical engineer of Norfolk, showed satisfactory results in respect to maintaining a high percentage of humidity in the mine. More recently I have made tests that confirm these results as well as the monthly reports sent to my office by the company during the last two years.

The humidifier consists essentially of a series of 3-in. pipe lines arranged 20 in. center to center in the intake airway. The pipes are connected at the outby end with a steam main by means of cross-pipes, elbows and tees. There are over 40 of these pipes in the humidifier, which is 70 ft. in length, making a total of 3,000 lin.ft. of 3-in. pipe. They occupy the entire cross-section of the airway. The inby end of each pipe is fitted with a small nozzle spray, which distributes the steam as it issues from the pipe into the air. The water resulting from the condensation of the steam is conducted by a concrete drain to a sump prepared to receive it. Also, the condensation in the pipe line drains to a trap, from which it flows into the sump, which is drained by a small pump located in the intake airway outby from the humidifier.

Briefly described, my test at the Powhatan mine, Jan. 20, 1915, gave the following results: 8:25 a.m., intake airway, 103,000 cu.ft. per min.; relative humidity, 82 per cent.; 8:56 a.m., main entry, last breakthrough, 18,200 cu.ft. per min.; relative humidity, 95 per cent.; distance traveled by the air, 7,560 ft.; width of entry, 8½ ft.; 9:45 a.m., room 41, last breakthrough, 16,900 cu.ft. per min.; relative humidity, 95 per cent.; distance of this room from radiator, 6,000 ft.

Out of 28 similar tests made in this mine, four tests showed a relative humidity of 100 per cent.; one test, 97 per cent.; fifteen tests, 96 per cent.; six tests, 93 per cent.; and two tests, 89 per cent. The average relative humidity in these tests was 95.5 per cent. These figures speak for themselves as to the effectiveness of the humidifier installed at this mine, since the outside atmosphere at the time of making the test showed a relative humidity of only 41 per cent. The humidity on the return airway of this mine at times reached 100 per cent.

In closing, permit me to draw attention again to the basic principle that must be considered in the design of any successful humidifier for mine use. The failure of so many forms of apparatus installed for this purpose is due to the fact that they do not take this principle into account. I refer to the relative carrying capacity of the air current at different temperatures. It must be remembered that when the outside temperature is low, as in winter, the air entering the mine may be fully saturated, but as the temperature rises, owing to the heat of the mine, its capacity to absorb moisture is rapidly increased, being practically doubled for each 20 deg. of rise in temperature, and as a result the air passing through the mine is quite dry, although carrying the same weight of moisture in the air current. I think a full discussion of this subject is important at this time and believe that a general law governing the essential points, which I have stated, would be effective in reducing the number of dust explosions in mines.

LAWSON BLENKINSOPP,
Mine Inspector, 13th District.

Egyptian State Ry. Specifications

Referring to the editorial on the Egyptian State Ry.'s contract, *Coal Age,* Aug. 28, p. 344, permit me to offer the following comments:

As to the strike clause, cancellation can be made only after actual suspension of shipments. It requires the delivery of the entire tonnage, but allows an extension of time for deliveries.

Purchases in the open market on account of failure to deliver are not left to the "judgment of the buyer" but are only allowed under failure to deliver as per contract.

You say that the ash specification is not so exacting as the volatile requirement. Now, the latter is about 35 per cent. and not more than 40 per cent. of volatile combustible matter, while the ash requirement is about 6 per cent., both being on dry coal. I submit that 6 per cent. ash is a much more exacting requirement than the 35 to 40 per cent. volatile, even though 2 per cent. more is allowed before penalty begins.

Your criticism of the loading dispatch is not quite warranted, in my opinion. The contract says that the time allowed for loading commences from the time the vessels are ready to load. Even at Hampton Roads ships are sometimes ready to load days before loading actually begins, this being due to congestion of ships and delays to the coal at the piers. There is sometimes a shortage of coal, which delays loading even after it has been started.

The record time of loading at Hampton Roads, which you give, began when the ship had tied up at the pier, with hatches open; she might have been ready to load and out in the stream for two or three days. It is true of course that we can load ships faster than they can abroad, but their fastest loading is fairly good, being 4,000 tons in 3 hr. 40 min., 2,652 tons in 2 hr., 2,100 tons in 1 hr. 57 min.

You say that "with freights at $11 to $12 to Mediterranean ports the deposit required is excessive." Freights are not at any such figure now and have not been for some time. The present rates are about $9.28. The deposits required may seem excessive to us, but Egypt is a long way from the source of supply and the costs are high. The successful bidder on the Panama R.R. contract must put up a bond of not over $30,000.

Under the contract provisions you state: "It seems unlikely that American shippers will be enthusiastic about this particular business in Egypt." Inasmuch as there were 159 bidders on this contract, many of them United States shippers, it would seem that while possibly not enthusiastic, the American shippers were quite willing.

And finally you advance the opinion: "In future years . . . it may be that conditions will be modified and that American shippers will be successful competitors for such contracts." You do not seem to be aware that United States shippers have had a share of this particular contract for the last three years and have been awarded 60,000 tons of the business for this year, 90,000 tons going to Monmouthshire coals, the balance (of 360,000) not awarded as yet.

Longwall vs. Room-and-Pillar Mining

Letter No. 4—In his letter No. 3, *Coal Age*, Sept. 11, p. 432, R. J. Brown cites a particular case of longwall mining adopted in a Northumberland mine, and adds, "The method proved an absolute failure." He should have given the particulars in regard to this mine so that we could judge correctly the cause of the failure. It is just these particulars that we all want to know whenever it is possible to obtain them.

Mr. Brown must bear in mind that there are more methods than one in longwall mining, and the cause of failure may have been the use of a method that was not adapted to the conditions existing in the seam. Perhaps when it was discovered that it was not a success, the operators hesitated to change their plan, fearing a like result would reward their efforts. I do not wish to reflect on the competency of the mine officials in that case, but only to emphasize the fact that the adoption of another method might have been rewarded with success.

To illustrate this point, permit me to cite an instance in my own experience. It occurred in a mine in West Yorkshire, England. An attempt was made, first, to work the mine on a longwall board-face, but it was found when the working faces were developed that the roof could not be supported by props, even by using cap-pieces a foot wide on top of the props. The operators were not discouraged, however, and at once adopted the plan of using split posts, which the men were required to set 4 ft. apart along the entire face of the coal. They soon found that this plan required too much deadwork. In their own words, the company was paying too much "consideration money" for the moving of dirt. The slate and shale roof would fall right up to the face, between the timbers. This was not only a menace to the workmen but produced much dirty coal.

After studying the matter, another plan was tried, which proved successful. A change was made from the "board-face" to the "end-on" method of driving. In other words, the longwall face was advanced on the ends or butts of the coal. This gave a greater support to the frail roof, although the miner was obliged to shear the coal at each roadway and mine or break it across the face until he reached the boundary of his working place. To explain more fully, this change from the "board-face" plan to the "end-on" method was necessitated because the first foot of the roof shale or slate was too friable to be supported when the coal was worked on the face.

I freely allow that the longwall method of mining cannot be applied under all conditions; but, under conditions favorable to its use, I maintain it is a superior method of mining than that of the room-and-pillar system. It does not appear to me that Mr. Brown will dispute this claim that the longwall method of mining, under favorable conditions, will give a lower cost of production and a more uniform output of coal, provided it is well managed by competent men.

We frequently see it stated that the longwall method has proved a failure in most American mines. It is more than probable that these failures have been caused by lack of judgment on the part of the officials in charge. There is one thing we must consider, and that is that many of these seams, owing to their thickness, require the building of good, substantial packwalls, for which suitable material must be selected. If this work is not well done, the result is a failure. The building of the packs is of far greater importance in the working of a seam 5 or 6 ft. thick on the longwall plan than when adopting the same method for the working of a 13- to 18-in. seam of coal.

In closing, I would ask in reference to the list of explosions given by Mr. Brown as having occurred in longwall mines, Are these as numerous as the explosions that occur in room-and-pillar mines? Explosions, in the latter case, occur with great frequency in newly opened mines, while the explosions in longwall mines have been largely due to the habit of gobbing the inferior coal in those districts. One could hardly expect that a mine that has been worked 50 years under such a practice could be immune from explosion. Another cause of trouble is the fact that the timbers are often left in the waste. These should all be taken out in longwall work, so that the roof can settle uniformly on the waste.

John Oldroyd.

Fairmont, W. Va.

Prohibition and Welfare Work

Letter No. 4—I do not want to be understood as criticizing F. S. Johnson's good letter No. 3, *Coal Age*, Aug. 28, p. 350, but would like to give my own views concerning one remark he makes, which is as follows: "At times I have been inclined to thing that there is a certain amount of coddling indulgence permitted in our welfare work among the foreign-speaking miners."

The foreign-speaking miners form a large majority of the mine workers in the West Virginia coalfields. In my experience they do not want to be "coddled" any more than does the American miner, although I may say that we can all stand a certain amount of coddling at times. But when judging the foreign-speaking miner we must consider his circumstances. We must remember that this class of mine workers comes largely from countries where strong drink is to be found in almost every public place, and was sold, before the war, with scarcely any restriction. Indeed, in those countries strong drink is the leading feature wherever people are gathered for a good time, and these foreigners coming to our shorees naturally follow their long-formed habits and inclinations. They enjoy themselves most when there is plenty of booze at hand.

We recognize this as a bad habit and one that is opposed to the best training and efficiency of the worker; but as has been stated previously, "If you would put an end to a habit of any kind in men, women or children you must give them something in place of it." Few have the power to break away from a bad habit without something is afforded to divert their thoughts into a different channel.

Mr. Johnson has referred to the different diversions furnished by the Y. M. C. A. in their work in many mining towns. These consist chiefly of reading-rooms and classes, with the added attraction of bowling, billiards, ball and tennis grounds, swimming pools, etc. We must admit that these are not so numerous at the present time, although I agree we are headed in the right direction regarding them. Now, we must not forget that most of these diversions are purely American sports and games, and naturally do not appeal to the foreigner. Again, we are too prone to regard foreigners as a class by themselves, and are not giving them an even chance to learn and become interested in our games. In our contact with these people we should forget nationality and encourage them to join with us in the enjoyment of the attractions and diversions offered. Are we doing this?

While speaking of the Y. M. C. A. diversions, first-aid teams, prize gardens and other uplifting agencies, I am reminded forcibly of the reference made to the power of music, in "Extracts from a Superintendent's Diary," *Coal Age*, Aug. 28, p. 337. This superintendent tells us of the universal appeal that music possesses, its all-pervading power and charm and the deep motion it is able to arouse in the human breast. That short article is worth the reading to anyone. In describing the effect of a song, he states: "Old grudges seemed to be forgotten, neighborhood quarrels seemed to have lost their meaning and distinctions of birth and salary meant nothing at all to the crowd while under the spell of the music." The crowd to which he refers was composed of the men, women and children of the camp, and the singing was that of a young lady visitor possessed of a "magnificent voice."

In closing, permit me to mention another reference made by George N. Lantz, Aug. 21, p. 309, who suggests: "Every community should have its local band or officer, while choral clubs and good quartettes always provide a source of profitable entertainment." In my own experience good musicians are plentiful in all mining camps, and these can be organized at little expense to give free concerts and provide good singing in places where the miners could bring their families for an evening's enjoyment. The Welsh and Germans long ago realized the value and power of music in their mining towns, and if we gave this matter the attention it deserves we would be surprised at the amount of such talent existing in our mining towns and ready at all times when asked to give their best efforts for the common good.

C. J. FUETTER.

Study Course in Coal Mining

By J. T. BEARD

The Coal Age Pocket Book

The Circumference—The circumference of a circle is divided arbitrarily into 360 deg., which probably originated as corresponding closely to the number of days in a year, or the ratio of the number of revolutions of the earth on its axis to a single cycle in its orbit. The number 360 is also a convenient number for subdivision.

The Quadrant—The quadrant is a fourth of a circle. Two diameters perpendicular to each other divide the circle into four quadrants, each containing a right angle and subtending an arc of 90 deg. in the circumference of the circle.

Radius, Chord and Tangent—A **chord** of a circle is perpendicular to the radius passing through its middle point.

A **tangent** is perpendicular to the radius at its point of tangency to the circle.

The **chord of an arc** of a circle is a mean proportional between the diameter of the circle and the rise of twice that arc.

The **half-chord** of a circle divides the diameter to which it is perpendicular into two parts or segments and is a mean proportional between them.

To Find the Center of a Circle—Draw two chords making a suitable angle with each other. Bisect each of these chords with a perpendicular. The center of the circle is determined by the intersection of the two perpendiculars.

Inscribed Angles—An angle is inscribed in a circle when its apex lies in the circumference and the lines forming the angle are chords, or one of the lines may be the diameter of the circle. Thus, in Fig. 2, on the preceding page, the angle ABC is inscribed in the circle whose center is O. Likewise, in Fig. 1, the angle BAC is an inscribed angle; also, the angle ABC and ACB.

An angle inscribed in a circle is measured by one-half of the subtending arc, and is therefore equal to one-half of the corresponding central angle, which is measured by the same arc. Thus, in Fig. 2, the inscribed angle ABC is exactly one-half of the central angle AOC, each being subtended by the same arc AC.

Any angle inscribed in a semicircle, as the angle ABC in Fig. 1, is a right angle, being measured by one-half of the semicircumference ADC or ½ of 180 deg. = 90 deg.

Inscribed Polygons—A polygon is inscribed in a circle when all of its angles are inscribed angles and its sides are chords of the circle. Since the perimeter of a regular polygon of a given number of sides is proportional to the radius of its circumscribing circle, and its area to the square of that radius, the side and area of regular polygons can be expressed as multiples of the circumscribing radius and its square respectively as given below:

No. of Sides	Subtending Angle	Length of Side	Area of Polygon
3	120°	1.732 R	1.299 R^2
4	90°	1.414 R	2.000 R^2
5	72°	1.176 R	2..378 R^2
6	60°	1.000 R	2.598 R^2
8	45°	0.765 R	2.828 R^2
10	36°	0.618 R	2.939 R^2
12	30°	0.518 R	3.000 R^2

The Coal Age Pocket Book

PRACTICAL PROBLEMS

Given the Chord and Rise of a Circular Arc—

1. To find the Radius: Divide the square of half the chord by the rise, and to the quotient add the rise and divide the sum by two; or, expressed as a formula,

Radius of arc, $$r = \tfrac{1}{2}\left(\frac{c^2}{4\,h} + h\right) \qquad (1)$$

2. To Fnd the Length of the Arc: The best method is to apply the principle of subchords, by first finding the rise of the arc for each successive subchord, in turn, using the formula,

Rise of subchord, $$h_1 = r\,(1 - \sqrt{1 - h/2\,r}) \qquad (2)$$

until a rise is found (h_n) that gives practically the same value as before for the total length of arc as calculated by the formula

Length of arc, $$l = 2\,n\,\sqrt{h_n\,(2\,r - h_n)} \qquad (3)$$

3. To Find the Area of the Sector Subtended by the Arc: Multiply the length of the arc by one-half the radius; thus,

Area of sector, $$A = \frac{l\,r}{2} \qquad (4)$$

4. To Find the Area of the Segment: From the area of the sector subtract the area of the triangle formed by the chord and the two radii drawn to its extremities, as expressed by the formula

Area of segment, $$A = \tfrac{1}{2}\,[l\,r - c\,(r - h)] \qquad (5)$$

Given the Chord and Radius of a Circular Arc—

1. To Find the Rise:Subtract the square of the half-chord from the square of the radius; extract the square root of the remainder and take the root thus found from the radius; or, expressed as a formula,

Rise of arc, $$h = r - \sqrt{r^2 - (c/2)^2} \qquad (6)$$

2. To Find the Length of the Arc: First find the rise of the arc by means of Formula 6; then follow the method described above, applying Formulas 2 and 3.

3. The areas of the sector and segment are then found as previously explained.

Given the Rise and Radius of a Circular Arc—

1. To Find the Chord: Subtract the rise of the arc from twice its radius; multiply the remainder by the rise; extract the square root of the quotient and multiply by 2, as expressed by the formula

Chord of arc, $$c = 2\,\sqrt{h\,(2\,r - h)} \qquad (7)$$

2. To Find the Length of the Arc: Apply Formulas 2 and 3, as previously explained.

3. The areas of the sector and segment are found as before.

Note—The above formulas, 1-7, give the closest approximation possible in the solution of circular arcs, sectors and segments, without the use of trigonometric functions.

Inquiries of General Interest

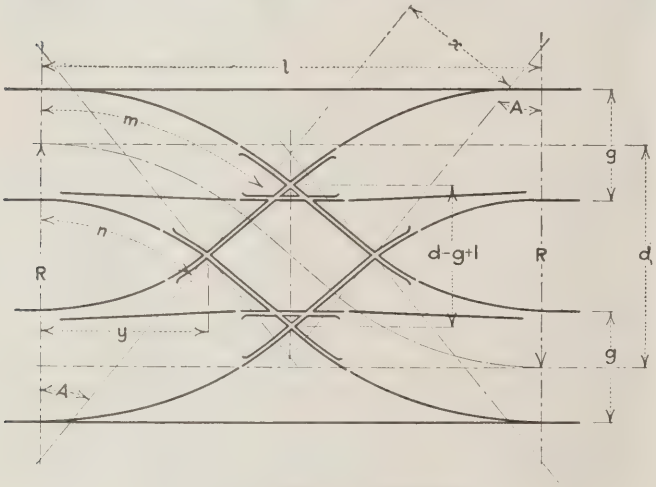
Calculating Diamond Crossover for Shaft Bottom

We want to put in a diamond crossover at the bottom of our shaft, and I would like to ask if it is possible to put in such a crossover with four frogs. There are two parallel tracks, each having a gage of 42 in., and the distance between the inner rails of these tracks is also 42 in. I would very much appreciate a sketch showing how this can be done and the position of the frogs and giving the other dimensions necessary to lay out the crossover.

ALVIS P. MERCER.

Martwick, Ky.

The only dimensions given in this case are the gage of the track ($g = 3.5$ ft.) and the distance between track centers, which is twice the gage, or $d = 2 \times 3.5 = 7$ ft. In order that such a crossover can be operated successfully, it is necessary that the two frogs on the straight rails of the two tracks shall be constructed, as shown in the accompanying figure, with a small triangle of solid iron in the center of the frog. The purpose of this is to sufficiently separate the three points where the gage lines of the three rails cross each other. It will be sufficient if the gage lines of the two switch rails cross each other 6 in. inside of the gage line of the straight rail. This will make the distance measured straight across the rails, between the two points where the gage lines of the switch rails cross each other, $d - g + 1$, as indicated in the figure. All the dimensions in the following calculation are made to gage lines.



A DIAMOND CROSSOVER

The first step in the solution is to find the angle A, which subtends the curved rail of each of these switches. This angle is found by substituting the values for d and g in the formula

$$Cos\ A = \frac{g}{d - g + 1} \times \frac{3.5}{7 - 3.5 + 1} = \frac{3.5}{4.5} = 0.7778+$$

Hence, $A = 38°\ 57'$.

The second step in the solution is to assume a convenient radius, say in this case $R = 10$ ft., and calculate therefrom the entire length of the crossover, from point of switch to point of switch, which is marked l in the figure. This distance is found by applying the principles of trigonometry, which gives the formula

$$l = 2\ R\ sin\ A + \frac{d - 2\ R\ (1 - cos\ A)}{tan\ A}$$

Then, substituting the known values in this formula, gives for the total length of the crossover

$$l = 2 \times 10 \times 0.6286 + \frac{7 - 2 \times 10\ (1 - 0.7778)}{0.8083}$$

$$= 15.73\ ft.$$

Since the angle of curvature of each of the switch rails is 38° 57′ and the radius of the outer rail in each switch is $r_1 = R + \frac{1}{2}g = 10 + \frac{1}{2}(3.5) = 11.75$ ft., the length of the outer curved rail, indicated by m in the figure, is

$$m = \frac{38°\ 57'}{180°}\pi r_1 = \frac{38.95}{180}(3.1416 \times 11.75) = say\ 8\ ft.$$

The radius of the inner curved rail is $r_2 = 10 - \frac{1}{2}(3.5) = 8.25$ ft., and the length of this inner rail, indicated by n in the figure, is therefore

$$n = \frac{38.95}{180}(3.1416 \times 8.25) = 5.6\ ft.$$

The length of straight rail in the switches, indicated by x in the figure, is found by substituting the known values in the formula

$$x = \frac{l - 2\ R\ sin\ A}{cos\ A} = \frac{15.73 - 2 \times 10 \times 0.6286}{0.7778}$$

$$= 4.06\ ft.$$

The two frogs in the loaded and empty tracks respectively are located midway between the switches, or at a distance of $\frac{1}{2}l$ from either switch. It now remains to calculate the distance of the two frog-points lying between the tracks, or the distance marked y in the figure. This distance is measured on the line midway between and parallel to the two tracks, from the line joining the switches to the point of frog. This distance is calculated by substituting the known values in the formula

$$y = \sqrt{r_2\ (d - g) - \tfrac{1}{4}\ (d - g)^2}$$

Since the radius of the inner curved rail (r_2) is 8.25 ft., the frog distance at each end of the switch is

$$y = \sqrt{8.25\ (7 - 3.5) - \tfrac{1}{4}\ (7 - 3.5)^2} = 5.08\ ft.$$

It is possible to lengthen out this crossover by adopting a longer radius than $R = 10$ ft. The angle of curvature (A), however, remains constant, for the same values of distance between track centers (d) and track gage (g), as appears from the formula given for finding this angle. For example, for a radius $R = 15$, the length of this crossover would be $l = 19.27$ ft. It is also possible to have the crossover rails cross each other outside of the track rails instead of arranging to have them cross within these rails, as in the foregoing figure.

Examination Questions

Tennessee Examination for Mine Foremen, Etc.

(Continued from Last Issue)

Ques.—A certain entry generates more or less marsh gas in many of its working places, sometimes in considerable quantities. This entry is worked with naked lights and kept reasonably clear of gas by means of a good ventilating current, which is carried well into the faces by frequent breakthroughs and the use of line brattices where necessary. A foreman, while making his rounds during the day and starting up this entry, finds the main door standing open and all the air short-circuited from the entry. He does not know how long the door has been open or what the conditions are at the face, except that a small number of men are working that day in this entry. Explain what he should do under these circumstances, giving reasons. How would you criticize the management of this mine?

Ans.—Since the foreman does not know how long the door has been standing open, or the quantity of gas that may have accumulated in the workings in the meantime, it would be dangerous for him to close the door and thus reëstablish the current in the entry. This would at once drive any gas that may have accumulated in certain places onto the open lights of the miners at work. It may be assumed that the miners have not experienced any serious trouble as yet owing to the door being opened. The foreman should therefore proceed with caution up the entry, leaving the door standing open. He should carry a safety lamp or, not having this, he should extinguish his own light and proceed in darkness. (All mine officials should carry a small flashlight for such emergencies as this.) If possible, he should leave someone to guard the entrance until his return. Having reached the men at work, the only safe method to adopt would be to order all lamps extinguished and withdraw the men from the entry temporarily until the place can be examined for gas in the usual manner with a safety lamp and pronounced safe for work. After the men have been withdrawn from the entry and before the door is closed, all the men working on the return of that current should be notified and likewise withdrawn. The door should then be closed and every entrance to that section of the mine and the return airway carefully guarded.

The setting open of a door in a mine does not necessarily call for the criticism of the management, further than to say that all doors should be so hung that they will close automatically unless they are propped or held open. If the door was propped open so that it could not close, this would call for an investigation that would place the responsibility on the guilty party.

Ques.—A miner on going back to a hole that he supposed had failed is injured by the explosion. He is badly burned on the face and arms and has his right leg broken above the knee. The doctor is out of the camp and it is impossible to obtain medical assistance for several hours. You have a first-aid outfit at the mine as required by the mining law. Describe in detail what you would do for this man while waiting for the doctor.

Ans.—As quickly as possible bring a stretcher and first-aid outfit, including splints and bandages, to the place. In the meantime, avoiding any unnecessary movement, place the injured man in as comfortable a position as you can. Having put him on the stretcher and carried him to the nearest convenient place where there is good air, proceed to bind a long splint reaching from the foot to the armpit on the outside of the injured leg, together with a shorter splint reaching from the foot to the crotch on the inside of the leg. The binding strips should encircle the chest as well as the limb, in order to prevent unnecessary movements of the fractured bone.

Apply a thin paste made with water and baking soda, starch or flour to the burned surfaces. Vaseline, olive or castor oil, fresh lard or cream may be used to keep the air from contact with the burn. Cover the burned parts with a light bandage to exclude air and dust.

Ques.—In a small drift mine in which one of the openings for air is the drift, while the other is a shaft through the hill and connected with the air course, the top of the shaft is about 100 ft. above the level of the seam. (a) Relying on natural ventilation, tell how and why the air will circulate. (b) Will there be any difference in the direction of the air current at different times of the year, and if so, in what direction will the air travel in the winter and in the summer seasons respectively?

Ans.—In a drift mine the seam may be assumed to be practically level. The air in the mine airways is supporting two air columns of equal height, but of unequal temperature, during the greater portion of the year, in that portion of these columns corresponding to the depth of the shaft. The two air columns have equal temperatures above the level of the top of the shaft, and it is unnecessary to consider them above that level, as their pressures balance each other.

(a) The air column in the shaft, however, does not always balance the corresponding 100 ft. of atmospheric column at the drift mouth, because of the shaft temperature being generally higher or lower than that of the outside air and the weight of the shaft column therefore being usually less or greater than that of the outside air column. As a consequence the air in the mine airways moves from the point of higher pressure to that of lower pressure.

(b) Yes. In the winter season the outside temperature being lower than that of the mine, the outside air column 100 ft. high is heavier than the shaft column, and this excess in weight causes the unit of ventilating pressure that forces the air to move from the drift mouth toward and up the shaft. In the summer the reverse is true—the mine temperature being then lower than that of the outside air, the shaft column is the heavier of the two columns, and the air moves down the shaft and out the drift mouth.

Book Reviews

Resuscitation, Manual and Mechanical

REPORT OF THE COMMITTEE ON RESUSCITATION FROM MINE GASES—By W. B. Cannon, George W. Crile, Joseph Erlanger, Yandell Henderson and S. T. Meltzer. United States Bureau of Mines, Technical Paper 77. Paper cover; 5⅞x9⅛ in.; 33 pp.; 4 ill. Free on application.

Some time ago "Coal Age" urged the Bureau of Mines to have its researches into subjects indirectly related to mining made by specialists as competent as those engaged to investigate mining problems and said that engineers ought not be chosen when sociological appointments had to be filled. Whether the Bureau took the advice thus proffered or not cannot easily be determined, but in any event when it decided to investigate resuscitation it chose out a formidable body of recognized experts to make the inquiries and a report. Yet "Coal Age" cannot consider itself impressed by the result.

In fact, the bureau itself, while publishing the monograph in full, added a preface in which it somewhat openly ignored the resuscitation device recommended by one of the committee and urged the Schaefer system of artificial breathing, just as if the Meltzer apparatus were, for some reason, impracticable. It must be confessed that this report, while at times quite interesting, is on the whole of doubtful value and does not appear quite fair.

MERIT OF OCCASIONAL RIB BREAKING

One of the principal recommendations does, it is true, meet with almost universal approval. The authors of the report advocate the use of the Schaefer instead of the Silvester treatment, and the public is by this time fully in accord with that judgment. But one reason given for that verdict is ridiculous. One of the advantages claimed in the report for the prone pressure method over the Silvester is that there is little danger of injuring the liver or breaking the ribs if pressure be gradually, not roughly, applied. Whoever suggested that the Silvester method had that defect? Why, then, claim the Schaefer is superior because with care it may not have it?

The Schaefer treatment has been credited with that defect many times, but here the fault is urged as a surpassing merit. Dr. Lauffler has declared that the system of resuscitation could only injure a patient whose bones were severely tuberculosed. Let us not be misunderstood. Probably the Schaefer method is as harmless as the experts assert, but to suggest that it is to be preferred to the Silvester method because, with proper care, it will not do what the Silvester method never can do is a queer process of reasoning. Such an argument is akin to that of declaring that a felon is better than an honest man because, while the honest man never committed a crime, the felon only did it when severely tempted. But perhaps it is not well to find fault with those who agree with us on the main issues, even when the reasons for their agreement are a cause of much regret.

One good reason for preferring the Schaefer method is given in our issue of Aug. 30, 1913, in an editorial on "The Schaefer Method." This argument in behalf of prone pressure has been too generally overlooked. The Silvester method employs parts of the body which are more likely to be burned or broken in an accident and therefore, to use a medical phrase, "is seldom indicated." The Schaefer method involves parts which the first-aid man usually finds entirely uninjured. It is therefore usually to be preferred.

WHEN FIDO HAS A FAINT DON'T GET A PULMOTOR

The part of the report which has caused no little excitement is that relating to the pulmotor, and it is probably proved that this insufflating device is ill-fitted for the resuscitation of chloroformed pussycats and anaesthetized and curarized lap dogs. A better system of supplying these animals with air in apnoea appears to have been devised long ago. It is to be hoped that all mine managers will remember this when Fido has a faint and will refrain from sending for a pulmotor.

It is interesting to note that, according to the report, the pulmotor more or less proves inadequate when used on animals. But Dr. Meltzer has found that another insufflation apparatus which had proved successful on dogs, cats, rabbits and monkeys failed to work on men, doubtless, however, not for the same reason as makes the pulmotor less valuable for small animals than for human beings. But that modifications are needed in the one case makes it only fair to admit that they may be required in the other.

Dr. Meltzer and his associates will doubtless assent to this, but as they do not make it plain it is well to assert it. Everyone knows that experimentation on one mammal is not a sure guide to the way in which another mammal will react to like treatment. It is frequently indicative, of course, and valuable, but it is by no means conclusive.

The committee seems to show unjustifiable bias in dealing with the pulmotor. The layman will hardly sympathize with the feeling of the profession so clearly manifested in the statement, "The pulmotor has received wide publicity in the daily press," and again, "Its loudest sponsors are the newspapers." The medical man has trained himself to feel as if by instinct that what the public praises is by that sign anathema. The reason for the doctors failing to praise the pulmotor, though many have approved it, is the same which restrains the technical press in general. The pulmotor is a proprietary article, and therefore anything written in its favor sounds like an advertisement. Moreover the doctors do not like to praise what doctors do not invent or introduce.

The report attempts to show that neither in Germany nor in the United States has the pulmotor been given much attention by the medical press and profession. It quotes several cases in which the pulmotor has been said to do good work, and then inquires either whether the persons really needed any help or not and whether some other means might not have done as well. To show how grossly unfair the insinuations are, one will be quoted.

IS THERE ANY CONCEIVABLE WAY BY WHICH A SKEPTIC CAN BE CONVINCED?

"Dr. Rossiter, company surgeon, Swissvale, Penn., reports a case of 'gassing' Dec. 28, 1912: The patient was unconscious, had no pulse, no signs of respiration, very feeble heart and loss of all reflexes. Before I arrived the hospital attendant performed artificial respiration in connection with the inhaling device of the pulmotor. I continued this treatment after my arrival for about one-half hour, at the end of which time there was very little change in the patient. I then switched over the pulmotor and adjusted it without pulling out the tongue or pressing on the larynx. In the course of a few minutes the patient started to fight and wanted to sit up."

The patient had been given manual artificial respiration by a hospital attendant, the doctor had continued the treatment for a half hour, and in addition he had permitted the patient to inhale oxygen and all the work done had just enabled the patient to keep life in his body. What does the committee say?

"In this case manual artificial respiration combined with oxygen continued the respiratory function for much longer than the critical period and the pulmotor was not necessary."

If then the victim of an explosion in your mine can be kept hovering between life and death by the expert use of manual movements and inhalation of oxygen, do not use a pulmotor—for he might get up and walk, and some foolish man in your employ might credit the pulmotor with doing the work. But the argument is so weak "Coal Age" may be excused if it quotes another gem—this time about some Bureau of Mines' cases:

"In the eighth case (Burgess) the pulmotor was first applied 30 min. after the victim had been removed from the gas atmosphere. No statement is made as to what was done for him in the interim. In the ninth case (Enzian) Dr. McGuire, of Wilkes-Barre, 'endeavored for two hours to revive her by artificial respiration. Failing in this a pulmotor was brought a distance of 8 miles. Under the manipulation of G. T. Holdaman the patient was revived in two or three hours.' Cases 8 and 9, in which the victims lived a long time before the application of the pulmotor (half an hour and two hours), do not present convincing evidence."

According to this method of proof a remedy which appeared to break up a chronic disease would be subject to more doubt than one which seemed to cure a passing ailment. And one which cures a passing ailment is not a cure because the ailment would cure itself in any event. Hence all remedies are vain.

We remember a much-discussed story about a woman who had an "issue of blood" for many years and had wasted her substance in going from doctor to doctor. She was healed by a miracle. We have often heard this event discussed. Some have denied the cure was miraculous; some have said it was psycho-physiologic; others have imagined some occult technique of which the record reports nothing. But had our five wise inquisitors been asked, we presume they would have said that the woman had lived so long it is likely she would have continued to live to a ripe old age, and in fact she was bound to get suddenly well at the precise moment when the alleged miracle occurred.

IS THE PULMOTOR TOO AUTOMATIC IN ACTION?

Three complaints are made against the pulmotor. One is its automatic activity taken in connection with the ease by which inspiration is turned in expiration. This can be corrected by the hand if necessary as the investigators admit. In fact, the insufflator recommended will not work in any other way. The objection is most obvious in the lower animals where the resistances are greater. The committee acknowledges that there may be differences between lower animals and men saying, "In lower animals, certainly, the blast often meets obstacles in passing from the larynx into the alveoli, and the inspiratory pressure of the automatic pulmotor is in many cases insufficient to overcome them."

A second complaint is that it effects expiration by suction. Reliance is largely placed on experiments with lower animals to prove that such suction is dangerous to lungs, bronchi and alveoli, and as we have said, such evidence is at least questionable. However, the committee quotes the experience of Dr. Morris Fishbein, who reported " a case in which a patient had been poisoned with carbon monoxide and was subjected to the action of the pulmotor for several hours. After nearly five days of unconsciousness the patient died. At the autopsy hemorrhage into the lungs and visceral pleura were found, together with subpleural emphysema (dilated areas) of the right lung, and the question was raised whether these pathological conditions did not result from the use of the pulmotor."

DID IT INJURE LUNGS, BRONCHI AND ALVEOLI?

But perhaps it would be pardonable to quote Dr. Fishbein at some length, which the committee fails to do. Under the heading, "Anatomic Diagnosis," referring to the patient, who was a colored adult, he says the following conditions were found: "Hemorrhage into the lungs and visceral pleura, subpleural emphysema of the right lung (following the use of the pulmotor?) engorgement of the pial vessels, edema and petechial hemorrhages in the lining of the small bowel, petechial hemorrhages in the lining of the greater antrum of the stomach and in the lining of the duodenum distal to the ampulla of Vater, hyperemia of the kidneys, small hemorrhages and slight edema of the lining of the base of the bladder" and 15 other adverse conditions.

All the lesions above given have reference to escape or engorgement of blood or its purple mottlings of the surface except emphysema, which refers to the presence of gas in the serum. So it is clear that for some reason the whole blood of this negro was affected, whether by the action of the pulmotor, by the withdrawal of 12 oz. of blood followed by intravenous transfusion of saline solution by the drop method practically continuously for five days, or by reason of the changes which took place after the patient died. It is to be noted that the committee failed to mention the other methods of resuscitation which the doctors at the Cook County Hospital adopted and said nothing about the work of the undertaker.

The reader will note that the date of the autopsy was not given by Fishbein, so the committee appears not to have been in position to tell whether the hemorrhages and emphysema were not rather due to changes after death than to the unusually extended use of the pulmotor. But they passed over this possibility and over those sequent on intravenous transfusion, illuminating gas absorption and the care of the undertaker. Delafield and Prudden in their "Handbook of Pathological Anatomy and Histology" well say, "It is the novice in postmortem examinations who is particularly apt to mistake postmortem alteration for significant lesions."

EVIDENCES THAT HEMORRHAGES MAY BE DUE TO ILLUMINATING GAS

The bulletin quoted refers to Robert S. Combes' article, "Clinical Manifestations of Illuminating-Gas Poisoning," and states that he probably has had no experience with the pulmotor because he says, "Reports from all over the country relative to its efficiency have been received." Consequently his testimony based on 1000 cases of gas poisoning will be all the more acceptable. If he says certain conditions exist and he has not used the pulmotor, then the lesions are not the results of the use of that instrument. If on the other hand he has used it, his testimony in its favor is not to be discounted by the committee.

He says: "At postmortem examinations the organs are deeply injected (swollen with blood), especially the spleen. There may be scattered small hemorrhages and at times cerebral changes, particularly areas of softening in the lenticular nucleus, symmetrical in many cases." Under the "Sequels" of gas poisoning he lists cases of broncho-pneumonia. Is it possible that these instances are really cases of emphysema of the lungs?

Dr. McCombes also says, but the bulletin fails to quote him, that the prompt suction by the pulmotor of the carbon monoxide present in the residual air and that which is constantly eliminated from the blood materially aids resuscitation. He adds that the pulmotor has made the necessity for venesection and introduction of normal salt solution less frequent. As he is referring to gas poisoning he does not refer to the power of the pulmotor to remove water from the respiratory organs, a further quality in its favor.

After all, if the pulmotor is a device which can save life it is not to be condemned even if it is proved that after several hours of action on a patient hopelessly poisoned it produces both hemorrhage and emphysema. They are not such dreaded afflictions. Many a man near death has been saved at the cost of a leg or an arm. But there appears no reason to believe the action of the pulmotor is of the character suggested even when infants are subjected to its kindly ministration.

ARE NOT ALL INSUFFLATORS APT TO CHARGE AND DISCHARGE THE STOMACH?

There is left the third charge that the entrance of air into and the escape of air from the stomach may cause movements that simulate respiration, although no air enters or leaves the lungs. The same is true of the Meltzer insufflator when the belt and compress or the weights on the stomach are removed. It is probably an excellent practice to deflate the stomach in the use of a mechanical breathing apparatus.

Some points which the authors regard as minor are, however, true and ponderable. The pulmotor does not supply pure oxygen; it is heavy and expensive and may, though of this we are not sure, waste much oxygen. They might also add that the instrument is complicated and contains much rubber which may get out of condition. But the report seems unfair in its conclusions and should be revised. It advocates a form of insufflator which has apparently been praised by no one but the committee and has apparently never been used. Not even newspapers are its sponsors, and the Bureau of Mines even hesitated to give it its indorsement in the preface.

A First-Aid Manual

VEST-POCKET FIRST-AID BOOKLET. By Daniel E. Sable, M. D., Assistant Gynecologist to the South Side Hospital, Pittsburgh, Penn., and Police and Fire Surgeon, Department of Public Safety, Pittsburgh, Penn. 104 pp.; 3¼x5⅞ in.; 64 illustrations. National First-Aid Publishing Co., Nixon Building, Pittsburgh, Penn. Price, 50c.

This is a good little book, but not so lengthy as that published by the American Red Cross, and not so complete. It is much more handy than the Johnson & Johnson blue book, for it will slip into a vest-pocket without much violence. Its briefness is not in illustration but in comment, and the pictures tell their story better than a lot of text.

In his preface the author says he has avoided long words. He tells about an intelligent workman, tears furrowing his grimy face, who stood fumbling a bulky old-fashioned first-aid volume. "Why can't they use plain English?" he commented bitterly. Then the author adds: "That is exactly what I have attempted to do." Nevertheless, the reviewer was surprised to find on the first text page, despite the preface, some expressions he didn't know, to wit: asphyxia algida, asphyxia carbonica, and another expression no one ever saw before—asphyxia neonatarium (neonatorum, surely).

The doctors must be allowed their frailty, and this medico nearly all through the book certainly does avoid using long words and talks plain hard sense to the general public. In fact, it seems sometimes as if, like Uncle Dick, in one of Dickens' novels, he kept a page like page 7 on which to spread himself when the current of words caught him foul. He seems to be extremely practical despite his lapses, which are infrequent. But he wants us to use carron oil. It is alleged that Dr. Halberstadt is proud that the corks of the carron-oil bottles, which an ancient law compels him to keep, cannot be drawn and his belief in the mussiness and detestibleness of that offensive mixture is shared by almost the whole profession.

The little volume is handy and inexpensive and has been translated into German, Italian and Slavish.

Coal and Coke News

Harrisburg, Penn.

The counties included in each of the eight districts into which the state has been divided for the administration of the Workmen's Compensation Act have been announced by the Compensation Board.

The referees are to be appointed by Nov. 15 and two of them will be located in the Philadelphia district and two in the Pittsburgh district. One referee will be located in each of the other six interior districts.

Harrisburg, Reading, Scranton, Williamsport, Altoona and Erie are the headquarters for referees outside of the Philadelphia and Pittsburgh districts.

District No. 1 includes Philadelphia, Delaware, Chester, Montgomery and Bucks counties. The two referees of this district will have headquarters in Philadelphia.

District No. 2 includes Berks, Schuylkill, Lehigh, Northampton and Carbon counties. Headquarters of the referee to be at Reading.

District No. 3 includes Montour, Columbia, Luzerne, Monroe, Pike, Wayne, Lackawanna, Susquehanna and Wyoming counties. Headquarters of referee will be at Scranton.

District No. 4 includes Dauphin, Lebanon, Lancaster, York, Adams, Franklin, Cumberland and Perry counties. The headquarters of the referee will be at Harrisburg.

District No. 5 includes Tioga, Lycoming, Bradford, Sullivan, Union, Snyder, Centre, Clinton, Cameron, Potter and Northumberland counties. The headquarters of the referee will be at Williamsport.

District No. 6 includes Cambria, Blair, Huntingdon, Mifflin, Juniata, Fulton, Bedford and Somerset counties. The headquarters of the referee will be at Altoona.

District No. 7 includes Erie, Warren, McKean, Elk, Forest, Venango, Mercer and Crawford counties. The headquarters of the referee will be at Erie.

District No. 8 includes Lawrence, Butler, Clarion, Jefferson, Indiana, Armstrong, Westmoreland, Fayette, Greene, Washington, Beaver, and Allegheny counties. The headquarters of the two referees will be at Pittsburgh.

It is pointed out by members of the State Insurance Board that of all the methods of compensation liability insurance permitted employers in Pennsylvania, insurance in the state fund alone gives complete protection from personal liability and from the filing of liens on the employer's real property which may very probably hinder, if not prevent, its sale or its use as security for the borrowing of money.

Every other form of insurance leaves the employer personally liable, every agreement or award of compensation may be entered as a lien against his land and cannot be discharged until the whole compensation agreed upon, or awarded has been paid in full, which may not be for 8 or 10 years.

On the other hand, a subscriber to the state fund, by giving to the Department of Labor and Industry the same notice of an injury to an employee which he is now by law required to give relieves himself from all personal liability. The state fund immediately assumes all his obligations and no claims against him can become a lien or cloud on his property, real or personal.

In addition, the act creating the state fund makes a sufficient appropriation to pay all expenses. This, with the entire absence of agents' and brokers' commissions enables the state fund to give this complete protection practically at cost.

PENNSYLVANIA

Anthracite

Kingston—Judge Moser, of Sunbury has been assigned to hear arguments in the case of the Kingston Coal Co. against the Plymouth Coal Co., in which the former company claims the latter should keep its fans and pumps in operation in the Dodson colliery. The Dodson colliery has been abandoned and the Gaylord colliery of the Kingston Coal Co. is affected because an opening had been made in the barrier pillars.

Lansford—To further combat the progress of the fire that has for years been destroying coal, the Lehigh Coal & Navigation Co. is now engaged in laying a line of pipe to carry the great volume of water from the No. 8 tunnel and thus pour it into burning coal deposit.

Eleven miners employed in the Foster tunnel of the Lehigh Coal & Navigation Co., at Coaldale, were entombed shortly before noon, Sept. 27, by a sudden rush of water breaking through the roof from an abandoned working. Two of the 11 men were rescued alive and in good condition, Sept. 28, while officials of the company have hopes of getting out alive others of the men still imprisoned. While it is believed that none of these miners have been crushed under the fall, it is possible that some of them may have been drowned.

Jeddo—The Union Improvement Co., a corporation which leased coal tracts in Hazle and Foster Township to the G. B. Markle Coal Co., under certain mining conditions on a coal royalty basis has filed equity proceedings against the latter company and asks an accounting and a payment of royalties in excess of what has been offered. The leases were made in 1890 and extend for a period of 30 years. A clause in the leases provided an increased royalty for coal sizes larger than pea taken from the Mammoth and Wharton veins.

Shamokin—Recently a falling stack at the boiler-house of the Corbin colliery struck three men, instantly killing one and seriously injuring two others.

Bituminous

Connellsville—Production and shipments of Connellsville coke are about equal and stationary at 390,000 tons per week. It is stated that while there is no actual shortage of coke cars, there is no longer a surplus, and the railroads are requiring operators to move all cars on the tracks promptly.

Pittsburgh—It is estimated that the Pittsburgh district is short 15,000 men, and there is slight hope of making good this deficiency. Coal cars are in demand and some of the railroads have notified companies not to expect much above 60 per cent. of their normal supply. Traffic in coal continues to increase steadily.

Uniontown—Persistent reports here are to the effect that the W. J. Rainey Co. is to transfer its force of accountants and auditors from New York to the Uniontown offices and make the general offices of the interests in this city. It is reported on reliable authority that the Rainey company is negotiating for a tract in a recently opened residential section of the city on which it is proposed to erect 20 brick dwelling houses for these employees.

Recent advances in the price of coke have temporarily put an end to a movement on the part of prominent coke producers to bring before the Interstate Commerce Commission the conditions of this region as to rates on bituminous coal as compared with the Pittsburgh and Greensburg-Latrobe districts. Competition with these districts in the coal trade, according to the local operators, is impossible with the alleged discriminatory rates now in force. The movement was well defined a few weeks ago when a committee of three appointed at a meeting of merchant coke operators conferred with Philadelphia officials of the Pennsylvania R.R. The meeting came to naught and the coke men considered taking their complaint to the Commission but recent advances in the price of coke have caused the coal trade proposition to be temporarily abandoned. Quiet influences are still at work to center the sentiment of the coke operators in order that a concerted appeal may be made at some future time.

Star Junction—Twenty-one ovens have been fired at the Murphy plant of the Echard Coal & Coke Co. and more will be fired by the end of the next week.

WEST VIRGINIA

Mullins—It is the current belief that the Virginian railroad will soon extend passenger service from Mullins to Elmore, a distance of about 15 mi. This new branch extends through a rich coal section.

Fairmont—More than 40,000 copies of the mining law of West Virginia, as amended by the last Legislature, have been received by the secretary of the Central West Virginia Coal Operators' Association for distribution among the miners employed by the coal companies operating in the central part of the state. The pamphlets are printed in seven languages, English, Russian, Hungarian, Polish, Italian, German and Slavonian.

The mining plant of the Four States Coal and Coke Co., which has been closed since the first of August, will be started at once, and within 10 days 500 miners will be working. The continued improvement in the coal business is the reason for resuming operations. The plant has been in the hands of a receiver for some time, but it is assured now that it can be operated at a profit.

Charleston—A class of 170 miners recently took the examination for mine foremen and fire bosses. It is said that this is the finest class of miners ever examined, and that the majority of the men showed the necessary qualifications for the position to which they aspire.

Holden—Mine safety car No. 8 of the U. S. Bureau of Mines will arrive at Holden, Oct. 2, for the purpose of giving demonstrations in mine rescue and first-aid work. The car will remain here until Oct. 14, during which period lectures will be given relating to rescue work. From here the car will go to Omar, W. Va., to remain until Oct. 27, after which it will proceed to Ethel, W. Va., remaining there until Nov. 9.

KENTUCKY

Middlesboro—The next quarterly meeting of the Southern Appalachian Coal Operators' Association will be held in this city on Oct. 22, this being the first time in the history of the organization that a meeting has been held outside of Knoxville. The reason for the change is that it is hoped more operators will attend, Middlesboro being nearer the center of the territory.

In addition to a car shortage which is affecting the operations in this territory it is stated that a labor shortage, to be charged in part to restriction of foreign immigration during the last year or more, will be noted before the winter is over.

Whitesburg—It is stated here that the mines of the Elk Horn Mining Corporation at Hemphill on Yount's Fork will resume in full shortly, giving employment to from 200 to 300 men. These mines have been idle since last November, although the company's plants in Fleming and Haymond have been running full time for several months turning out a large output.

Some coal operators of the eastern Kentucky field complain of a car shortage along the Louisville & Nashville R.R. which is affecting, somewhat, the mining activity, although operators insist that business is fairly good. Prospects look encouraging also for the business in the future, and the railroads promise to remedy the car shortage.

OHIO

Columbus—Statistics are being compiled by the Ohio Industrial Commission showing the average yearly earnings of coal miners in the state. This work is being carried on by Fred C. Croxton, chief statistician who is compiling figures on all of the employees of the state.

ILLINOIS

Millstadt—The Lippert Bros. Coal Co., recently organized, has opened a mine half a mile southeast of Millstadt. The shaft is 40 ft. deep. The Buxton & Miller Coal Co. has reopened an old drift mine one mile south of Edgemont, which will be known as the Buxton mine.

Belleville—The International Coal Co. has electrified its mine by installing a fan motor and electric mining machines and a substation containing one 150-kw. 250-volt 525-ampere generator, driven by a 220-hp. motor, power for which is furnished by the Southern Light & Power Co. The Superior Coal Co. has installed electric motor haulage consisting of one 8-ton mine motor, a 75-kw. 250-volt 525-ampere generator, driven by a 150-hp. motor, power for which is furnished by the Suburban Railroad Co.

The fifth annual report of Thomas C. Wright, inspector of mines for St. Clair County, shows that there are 69 mines in the county, against 71 last year, and that of these 17 are not being operated, against 15 last year. The total output for the year ending June 30, 1915, was 3,017,820, against 4,117,002 last year. Of the 52 mines in operation 36 were shipping and 16 were local operations. Five men were killed in mine accidents in the county during the year and 36 were so badly injured as to be disabled 30 days or more. The company which hoisted the most coal from one mine was the St. Louis & O'Fallon Coal Co., with a total output of 643,615 tons. The Consolidated Coal Co. hoisted 468.730 tons from one mine The Taylor Coal Co. hoisted 295,319 tons from two mines, the Southern Coal, Coke & Mining Co., 144,386 tons from one mine and the Suburban Coal & Mining Co. 127,780 tons from one mine.

Harrisburg—Reduction of the salaries of superintendents, assistant superintendents and bosses at the O'Gara mine No. 9 came near precipitating a strike of those functionaries recently. These men however finally decided to accept the reduced salaries and keep their jobs.

Springfield—It has been found advisable to postpone the examination for the office of chief clerk of the mining board until Nov. 6 in order that wider publicity might be given and a greater number of applications secured.

IOWA

Des Moines—James Finney, coal miner, who lost an eye in a mine accident at Bussey, Ia., has informed the Iowa Industrial Commission that he will claim compensation for complete disability under the workmen's compensation act. Finney had but one good eye when he went to work for the coal company. The question to be submitted to arbitration is whether the employer can be compelled to pay a workman for total disability when he loses his second eye.

The Keystone mine, operated by the Keystone Coal Co., has resumed operations after a shut down of 4 days to correct conditions complained of by the mine inspectors.

Centerville—An examination for mine foreman and hoisting engineers will be held at Centerville on Oct. 5 and 6. Candidates for these certificates will be required to answer satisfactorily 12 written and 8 oral questions.

NORTH DAKOTA

Wilton—The mine of the Washburne Lignite Coal Co. is busy as orders from all over the state have been received in considerable abundance, and shipping is at the rate of between 25 and 30 cars per day. Since the new coal rate has gone into effect, the local plant has been obliged to put on more men in order to supply the trade. With prospects of an early fall and severe winter, this mine is preparing for the biggest year in its history.

COLORADO

Trinidad—Naturalization schools for adult coal-mine workers will be organized at a conference to be called here October 11. Mary C. C. Bradford, state superintendent of public instruction, the superintendents of schools in Huerfano and Las Animas counties and the sociological department of the Colorado Fuel & Iron Co. will then convene and visit the leading southern Colorado coal camps with the object of deciding the best means of accomplishing desired results.

PERSONALS

F. L. Garrison, sales agent of the Pittsburgh-Westmoreland Coal Co. at Buffalo, N. Y., has resigned his position to go into other business.

E. J. Conroy, formerly sales agent for Castner, Curran & Bullitt, has been appointed resident manager for C. C. Corey, at Grand Rapids, Mich.

William Jay Turner was on Sept. 25 appointed general counsel of the Lehigh Coal and Navigation Co., in the place of Samuel Dickson, deceased.

James B. Mahon and D. D. Hull were recently elected directors of the Virginia Coal & Coke Co. to succeed B. P. Learned, and Henry K. McHarg.

Wm. J. Turner has been elected general solicitor for the Lehigh Coal & Navigation Co., filling the position made vacant by the death of the late Samuel Dickson.

S. D. Forbes, in recent years sales manager of the New England Coal & Coke Co., is now manager of sales for S. P. Burton & Co., Boston, New England representatives of the Crozer-Pocahontas Company.

F. F. Morris recently returned from the German office of the Draeger Oxygen Apparatus Co. to Pittsburgh, and is prepared to proceed with the manufacture of helmets and other oxygen apparatus in this country.

F. R. Wadleigh sailed from New York on Sept. 29 for the purpose of investigating coal markets in France, Spain and Italy in particular, and is not expected to return until December. Mr. Wadleigh is representing some large American coal interests.

W. E. Hardy, for the past 11 years connected with the Diamond Rubber Co. and the B. F. Goodrich Co., being lately in charge of the sales department of the mechanical rubber-goods division, has been appointed sales manager for the Boston Belting Co., of Boston, Mass.

Secretary B. F. Nigh, of the Michigan-Ohio-Indiana Coal Association, reports quite an increase in the membership of the association since the annual convention held at Cedar Point in June. In the last 60 days more than 40 new members have been added to the rolls. In the same period the association has collected more than $800 freight claims against railroads for its members.

John Harding, identified with the Connellsville coke industry for a number of years has assumed the superintendency of the Garwood plant of the Aetna Connellsville Coal & Coke Co. He succeeds C. L. Patterson. Mr. Harding's home is in Uniontown, Penn., where he has successively been employed by the H. C. Frick Coke Co. and several independent concerns. He was lately in business for himself.

Clarence J. Hicks, formerly with the International Harvester Co. and for many years prominent in Y. M. C. A. work, has been appointed executive assistant to J. F. Welborn, president of the Colorado Fuel & Iron Co. Mr. Hicks in addition to his general duties as full assistant to Mr. Welborn, will have charge of the social service and general betterment work which the company has lately instituted.

John S. Johnson, for a number of years outside superintendent for the Lehigh Coal & Navigation Co., has been appointed inspector of construction work for the Hudson Coal Co. Mr. Johnson, whose duties will be the superintending of repairs to breakers and construction of all descriptions around them, will work under the direction of Eli T. Conner, chief consulting engineer of the Hudson Coal Company.

Vice-President Charles O'Neill, of District No. 2 bituminous field, of the United Mine Workers of America, recently stated that this district was 10,000 miners short of the usual working forces as a result of the European war and the demand for men in steel and allied industries. Thousands of men have gone to Europe to join the armies of their respective countries. With only a normal demand for coal this winter, it is stated, there will be a decided labor famine.

INDUSTRIAL NEWS

Buffalo, N. Y.—The John K. Kerr, Inc., Coal Co., lately organized, has opened an office at 39 Erie St. Mr. Kerr is president and general manager.

Muskogee, Okla.—The Oklahoma Consolidated Coal Co. has been incorporated with a capital stock of $500,000. The incorporators are R. T. Price, E. A. Jennings, and E R .Jones, all of Muskogee.

Terre Haute, Ind.—The Interstate Mining Co. has been incorporated here, with $5,000 capital stock, to do a mining business. The directors are F. G. Fisbeck, I. H. Woolley and George H. Richards.

Powhatan, W. Va.—It is announced by the management of the Powhatan Coal & Coke Co., of Powhatan, W. Va., that the company will construct a tipple at a cost of $45,000 to replace the one which burned recently.

Denver, Colo.—Rumors that the James J. Hill interests were negotiating for the Rockefeller holdings in the Colorado Fuel & Iron Co. have been denied. Hill personally refused to discuss the matter but his secretary denied the entire report.

Huntington, W. Va.—The Chesapeake & Ohio R.R., it is believed, will load more coal in 25 days in September than it did in 26 in August. Several circumstances combine to make coal prospects brighter than they have been before in many years.

Lex, W. Va.—The Rocky Branch Pocahontas Coal Co. was recently organized with a capital of $5,000. The incorporators are H. J. Brooke, Edythe Brooke, and J. A. Thorn, of Welch, W. Va., and Archibald Shimmin, and D. R. Hopkins, of Bluefield, W. Va.

Hartshorne, Okla.—The McAlester Colliery Co. of Hartshorne has just been incorporated with a capital stock of $50,000. Incorporators are: S. L. Moreley, Oklahoma City; H. P. Rivers and W. J. Hulsey, of Hartshorne. The company will operate mines near McAlester.

Grafton, W. Va.—It is stated that the labor question is rapidly growing more and more serious in this region. It is stated by some authorities that the coal business in West Virginia cannot be materially increased at present owing to the fact that no more laborers can be secured.

Crewe, Va.—The Wilson-Berger Coal Co. has been incorporated with a maximum capital stock of $350,000, and a minimum of $50,000. The incorporators are C. E. Wilson, president, Crewe, Va.; William H. Mann, and W. H. Mann, Jr., of Richmond, Va.; P. C. Berger, of Chatteroy, W. Va.

Baltimore, Md.—At a recent meeting of the board of directors of the Baltimore & Ohio R.R., authority was voted for the construction of a coal pier at the Curtis Bay terminal at Baltimore. This will have an estimated capacity of 10,000,000 tons per year, and will cost approximately $1,500,000.

Clarksburg, W. Va.—The Central Fairmont Coal Co. recently closed a yearly contract with a railroad for the latter's entire requirements of coal, and is now employing about 100 additional miners. This firm has also purchased additional live stock for the purpose of meeting the increased production.

Charleston, W. Va.—The Island Creek Coal Co., a corporation of the State of Maine, was recently admitted to do business in the State of West Virginia. The capital stock is $250,000, while the assessed valuation of the property owned by the company in the state is over $2,300,000, most of which lies in Logan Copnty.

Carterville, Ill.—William E. Trautmann of East St. Louis, receiver for the Carterville Coal Co., Carterville, Ill., has filed a petition with the United States District Court for permission to sell the mines of the company. The mines, under ordinary conditions, are estimated to be worth $150,000. The indebtedness of the company is $85,000.

Louisville, Ky.—Articles of incorporation have been filed here by the Nashville Mining Co. with a capital of $11,000 and a debt limit fixed at $25,000. The company proposes to operate mines and leases, hold, buy and sell coal, clay and other mineral lands. G. W. Hardin, B. H. Farnsley and Clarence Dallam are the incorporators.

Huntington, W. Va.—Default having been made on the payment of bonds of the Branchland Coal Co., issued in 1907, the Equitable Trust Co. of New York, has advertised the property situated in Logan County for sale on Wednesday, Oct. 20. The bonds are for $150,000, while the estimated value of the property is between $250,000 and $300,000.

Pottsville, Penn.—The Eastern Pennsylvania Coal Co., of Middleport, Schuylkill County, has been finally adjudged by the U. S. District Court at Philadelphia as an involuntary bankrupt. The company was formed to operate an abandoned working near here, but the enterprise did not meet with success, as it was found too costly to mine the coal.

Huntington, W. Va.—A 60-mile extension of the Virginian R.R. is now in process of construction. This railroad will run from Mullen through Pineville, Winden, Baileysville, and along the Guyan Valley through Gilbert in Mingo County to Mann in Logan County. All the rights of way have been secured, and forces are engaged in grading preparatory to the laying of rails.

Baltimore, Md.—Announcement was recently made here to the effect that the Alabama Co., the successor to the old Alabama Consolidated Coal & Iron Co., has just closed a deal for the sale of approximately 400 acres of its coal lands, located in the Birmingham district of Alabama. The price which the purchasers paid for the property was in the neighborhood of $80,000.

Whitesburg, Ky.—C. A. McIntyre, B. P. Young and others are negotiating for the purchase of a large tract of coal and timber land above here on the Louisville & Nashville R.R. in the Elkhorn coal field of Letcher County. In the event of the deal being completed work of development such as the opening of mines, grade work, the building of miners' houses, etc., will be started immediately.

Huntington, W. Va.—The Pond Fork Ry. Co. was recently incorporated with a capital stock of $26,000 for the purpose of constructing and operating a railroad from Madison, Boone County, up the Pond Fork of Coal River to the head waters of Pond Fork, a distance of about 25 miles. The incorporators are R. M. Baker, Herbert Fitzpatrick, J. A. Hagen, Jr., George Garred, and F. B. Enslow, of Huntington, W. Va.

Artemus, Ky.—The Jackson Coal Mining Co. has taken over the operations formerly conducted in the name of the Dean Coal Co., near Artemus. The main office of the new company is in Knoxville, Tenn., in charge of A. B. Day, of the Sanford-Day Iron Works, as president, and D. H. Jenkins, of the Proctor Coal Co., as secretary. The operations will be in charge of W. B. Kinder, superintendent, at Artemus.

Columbus, Ohio—The Ohio Coal Washing and By-Products Co. has been incorporated with a capital of $50,000 to erect and operate a coal washery at some location in the Hocking Valley. The location is to be fixed at a later date. The incorporators are William Job, E. E. Hazelton, E. E. Learned, Arthur F. Ayers and H. L. Sibley. The leader in the movement, William Job, is well known in coal circles in the Buckeye state.

Cincinnati, Ohio—The Kellioka Coal & Coke Co. has filed in the United States Circuit Court of Appeals its appeal asking the reversal of a judgment of the Federal Court in Kentucky, under which it was adjudged to be the holder of a fraudulent deed to several hundred acres of coal land in Harlan County, Ky., valued at $20,000. Z. B. Brock, the former owner of the land, claimed that he had been induced to part with title for an inadequate consideration.

Pineville, Ky.—The Creech Coal Co., with Robert Creech as president and general manager, capitalized at $200,000, has just been incorporated. The Banner Fork Coal Co., with W. J. Cunningham as president and L. P. Johnson as secretary and treasurer, has been incorporated with a capital of $100,000. Both of these companies contemplate operations on the recently extended branch of the Louisville & Nashville R.R. up Wallins Creek in Harlan County.

Louisville, Ky.—Bondholders of the Consolidated Coal Co., owning and operating mining properties in eastern Kentucky, are said virtually to have agreed to a proposition whereby they are to receive half the interest on their bonds during the next two years, with the understanding that the other half due them is to accumulate for payment at such times in the future as the company's finances will justify settlement in full. The company has outstanding a little less than $3,000,000 in bonds.

Philadelphia, Penn.—All the large shippers of coal in this territory have been notified by the various railroads of the car shortage which is becoming more serious as the season advances. Recently the Baltimore & Ohio began to place the operators in this district on the percentage basis, and the same company has issued a letter to all large shippers urging that they use care in making shipments and in addition to do all in their power to release cars at unloading points as promptly as possible.

Hickman, Ill.—The Nashville, Chattanooga & St. Louis R.R. Co. has announced that it will not take advantage of a ruling of the Interstate Commerce Commission allowing it to charge $1.50 per ton on all coal delivered to Hickman. The rate announced is $1.35. The old rate was $1.20. An attempt was made by the company to put the $1.50 rate into effect, but appeals were made to the Commission and the matter was held up for several months. The railroad company finally announced the $1.35 rate.

Charleston, W. Va.—The Kanawha Coal Shippers' Association is contemplating arrangements designed to meet the situation which will arise in case the proposed increase of 15c. in the rate from West Virginia coal fields to Western points is adopted. The plan as tentatively settled upon provides for the establishment of big storage and distribution centers at Marietta, Portsmouth and Cincinnati, Ohio, Huntington and Pt. Pleasant, W. Va., and Evansville, Ind., to which coal will be sent by river from various West Virginia river points at which loading plants will be erected.

Philadelphia, Penn.—Nothing has stirred the coal operators in the West Virginia fields recently as has the request of the four trunk-line roads in the state applying to the Interstate Commerce Commission for permission to advance the rates on bituminous coal 15c. per ton. As a consequence of this action by the railroads the prominent producing interests held a meeting in this city recently to map out a course of action to combat that of the railroads. The operators contend that to allow such an increase will badly cripple the coal business of the entire state, together with all other industrial enterprise closely allied with it.

Pittsburgh, Penn.—The Westinghouse Electric & Mfg. Co. has been awarded a number of prizes and medals at the Panama-Pacific International Exposition. Among these was a gold medal for the most complete and attractive installation in the palace of transportation. Gold medals were also received on a number of different classes of apparatus, among which are steam turbines, alternating- and direct-current generators, alternating- and direct-current railway motors, transformers, rectifiers, starting, lighting and ignition systems, switchboards and accessories, and mining locomotives. A grand prize was also received on a 4,000-hp., 650-volt, direct-current, double-unit Pennsylvania electric locomotive.

Philadelphia, Penn.—Contrary to opinion expressed at the time the railroads obtained a delay of two months before the enforcement of the new anthracite rates as ordered by the interstate commerce commission, it now appears likely that the companies will ask for a rehearing of the entire case. When the postponement to Dec. 1 was asked for it was stated that the delay was made to permit the railroads to check their tariffs in order to find any errors or discrepancies in the new rates. It is alleged that the companies will base their reason for a new trial on the fact that not a single member of the interstate commerce commission personally heard the testimony. In the beginning Commissioner Marble sat for two days, when he was taken ill and died. After that the testimony was completed by an examiner and the decision of the commission was founded on the information elicited by him.

Coal Trade Reviews

General Review

Cold snap stimulates the anthracite trade. Bituminous stiffer but not particularly active. Further advance in vessel rates checks exports. Car supply becoming the predominating feature at interior points.

Anthracite—The return of lower temperatures has precipitated a general buying movement and the new month has opened with anthracite fairly active. Orders are becoming urgent and indications point to a consistent improvement from now on. The frequent predicitions of the summer months, that consumers were failing to stock, have been fully sustained by the heavy buying developed by the first appearance of cold weather. In retail circles, however, there is still considerable competition, which continues to force some low prices in spite of the fact that wholesalers are showing a stiffening tendency as regards quotations. Steam sizes are particularly strong. The possibility of labor difficulties next April is also coming in for more consideration as the season advances, and it is noted that manufacturers are here and there laying by a few cars of coal of steam sizes against a possible future emergency.

Bituminous—The return of more seasonable weather has created a better feeling in bituminous and the market is appreciably stiffer, though not particularly active. It is noted that the railroads continue stocking operations and the larger manufacturers are being influenced to do likewise. Consumers are demanding close to the maximum tonnages on contracts, and occasional requests for urgent shipments are even being received. Buyers are showing a disposition to cover their requirements, but operators are not inclined to consider business ahead at the prevailing low figures. Some of the better grades are already practically out of the market and uncertainties in the car and labor supply are now definite factors in the situation.

Exports—Scarcity of vessels and a larger internal consumption have created a momentary relapse in the foreign business, but inquiry continues very persistent and there is every reason to anticipate a heavy demand through the balance of the season. The foreign trade is still largely predominated by the freight market, which has advanced still further, under the influence of a heavier demand for grain vessels. Tonnage is very scarce even at the new high level. Coastwise rates have not changed materially, but there is a notable absence of sailing vessels, most of the latter now being engaged in the off-shore business.

Lake Markets—The growing car scarcity is gradually looming up as the predominating feature in the coal markets. Nearly all districts are beginning to feel the pinch, and shippers are generally declining orders where special equipment of any kind is specified. Lake shipments are somewhat heavier than a month ago, but it is gradually developing that the closing period of navigation will not experience such a rush as was anticipated. The August shipments from the Upper Lake ports to interior points show a substantial increase over July, but the gross movement for the season to date is slightly behind last year, and there is only a little storage room available, this being held for some special grades.

Middle West—Noticeably cooler weather with frost in some localities has started coal moving into the consumers' bins, while dealers are giving greater consideration to their stocks, and the situation is generally active on the domestic grades. Buying is being resumed on a broad scale and there is little cheap coal offered. A definite car shortage at this time, some mines losing one and two days per week, is causing noticeable anxiety as to the outlook later when the winter trade gets under way. The railroads are still absorbing a heavy tonnage for stocking purposes, while there is a good movement of Illinois coals into the Northwest, all rail. Business in this direction is growing steadily and showing indications of a strong, persistent demand throughout the balance of the season.

A Year Ago—Domestic grades of anthracite in strong demand, but steam sizes are heavy. Bituminous still slowing down though prices are well maintained. Industrial demand suffering from generally adverse conditions.

BUSINESS OPINIONS

Iron Age—Signs of increasing home consumption are plainer as the steel trade enters the last quarter of the year. The upward trend of prices is, if anything, more marked, and inquiry for rolled steel for the first quarter of next year is broadening. The problem of the bar mills in making deliveries on home contracts, and at the same time meeting the demands for war steel, is growing more difficult. A Cleveland company closed this week with the Lackawanna Steel Co. for 35,000 tons of bars, deliveries extending over twenty months. New orders for shell steel are coming out constantly. Additional requirements for France that will come to the mills when the present French contracts are finished in February amount to 300,000 tons.

American Wool and Cotton Reporter—The wool market is still quiet, but has a firm undertone. The lifting of the British import on crossbreds, it is felt, will make the American market unsteady to a certain extent and may tend to lower the prices of medium wool, although the depressing influence will be only temporary. All indications point toward further advanced prices for wool. These will take place, it is thought, on each big buying movement.

Philadelphia News Bureau—The completion of the Anglo-French loan is the important feature of the moment. This settles a most difficult problem. The joint note offered is probably the strongest foreign note that could be offered. The victory of the allies in the western front has added strength to the loan. But besides the loan, the beginning of the heavy crop movement and the strong position of the banks help. Sterling exchange should gradually advance more to the normal and yet the import point of exchange will be much below the old-established basis. The tendency of sterling is bound to be downward because of the fact that our exports of merchandise is to be so largely in excess of our current imports.

Dun—Commercial enterprise responds to the stimulus of lower temperatures, which accelerate a broader distribution of fall wearing apparel and other merchandise. Industrial operations, notably in iron and steel and allied lines, continue apace and full employment of labor, in a number of instances at advanced wages, materially enhances the purchasing power of the people. Savings bank deposits, drawn down during the late period of depression, are again accumulating, and practically unlimited financial resources are available for facilitating the return of national prosperity.

Bradstreet—Trade currents are running more freely than heretofore; remaining obstacles to progress are passing; growth is of the cumulative type; sections somewhat pessimistic a while ago are now taking a brighter view of the future, and international political and financial matters apparently have assumed more pleasant aspects. Three forces loom large in the week's expansion—cold weather, higher prices for cotton and foreign orders for munitions of war.

Southern Lumberman—The steadily improving outlook which has been noted in the yellow pine market for the last four weeks or more has now begun to be converted into actual business, and prospects for greater improvement are better than at any time in months. Reports received this week from the producing territory of the South and from distributing markets of the Middle West are uniformly optimistic, and show more business done and at better prices than during any recent week. Actual fall trade has now begun in the hardwood market. This is shown by better demand from furniture manufacturers, by continued call from the railroads and car shops, and heavier buying by automobile and implement factories than has characterized the market for several weeks.

Marshall Field & Co.—Current wholesale distribution of dry goods has been more satisfactory than for some time past. Orders received daily have shown a material increase consistent with the more seasonable weather. The total number of buyers in the market this week was considerably more than a year ago. Collections have been good, and shipments of merchandise considerably ahead.

ATLANTIC SEABOARD

BOSTON

Slow improvement in Pocahontas and New River. Railroads stock up more than usual but no like move among manufacturers.. Water freights continue the same and anthracite is steady after a dull September.

Bituminous—Now that the weather is more seasonable there is a renewed optimism over fall trade in Pocahontas and New River. Progress, however, is very slow. Coal is in ample supply at all the Hampton Roads piers, but the slow movement of boats coastwise is partly responsible for the accumulations. Export inquiry is fairly constant and there is apparently every reason to count on an active demand from this quarter the balance of the season. A shortage of equipment on the coal roads is beginning to be talked in this territory but buyers here are seldom interested in such predictions until prices actually begin to move up.

Some of the New England railroads are stocking up to a greater extent than usual and this is expected later to influence some of the larger manufacturers to do the same. Receipts on contract are now only about normal, but if conditions are good it is expected they will increase as the month goes on.

Georges Creek is coming forward in about normal volume. The shippers are now fairly well caught up on contracts and have spot coal available in limited quantities on about the contract range of price.

Sales agents for the Pennsylvania grades are already canvassing with a view to next senson's business. In some cases prices are being named subject to advances in the mining scale and in tolls to tidewater. Should there be a greater advance in tolls on the railroads from West Virginia than from the Pennsylvania districts there would probably be a largely increased opening for the Pennsylvania grades.

Water Freights show no material change; 75@80c. is the prevailing rate on 2,500 tons upward, Hampton Roads to Boston, but there is still a dearth of sailing vessels. Most of the latter are still engaged in off-shore business.

Anthracite—September was a very disappointing month for retailers. As a result, the fall trade will be rushed the latter part of October and in November when dealers least need orders. As it happened, the warm spell coincided with the fog along the coast, and most of the companies are still reasonably well supplied with orders. At the same time there is no difficulty about securing any sizes the customer requires.

Bituminous quotations, f.o.b. loading ports at points designated, are about as follows per long ton:

	Philadelphia	New York	Baltimore	F.O.B. Mines
Clearfields	$2.15@2.65	$2.45@2.95	....	$0.90@1.40
Cambrias and Somersets	2.40@2.90	2.70@3.20	....	1.15@1.65
Georges Creek	2.92@3.02	3.22@3.32	$2.85@2.95	1.67@1.77

Pocahontas and New River prices on cars at Boston are $3.55@3.73, Providence,$3.50@3.68, and f.o.b. loading port at Hampton Roads, $2.80@2.85.

NEW YORK

Anthracite situation improves. Demand better and prices for individual coals stronger. Better feeling in soft-coal market. Car and labor situation serious. Contract holders taking full quotas.

Anthracite—The anthracite market shows improvement. Lower temperatures caused a better demand and independent operators are receiving higher prices than for some weeks past. Demand from the West continues brisk and consumers are being urged to stock up while transportation conditions continue favorable. The companies continue to store large quantities of all sizes, particularly the smaller buckwheat coals.

Individual coals are now within about twenty cents of the companies' circular. Nut coal seems to be the only one of the prepared sizes causing any trouble to shippers. Demand for pea and No. 1 buckwheat remains about the same. Nos. 2 and 3 are shorter. Considerable of these coals are being stored by the operators in anticipation of winter demands. The next week or ten days will, however, see a big change in the steam-coal situation, owing to the heat being turned on in the big office buildings.

The line trade shows much improvement. Demand from New England is notably better. Mine prices are as a rule a trifle stronger than at tidewater. Shippers complain of the scarcity of small cars and operators are beginning to feel the effects of labor shortage.

Current quotations at tidewater, per gross ton, f.o.b., are as follows:

	Lower Ports		Upper Ports	
	Circular	Individual	Circular	Individual
Broken	$5.05		$5.10	
Egg	5.30	$5.00@5.30	5.35	$5.10@5.35
Stove	5.30	5.00@5.30	5.35	5.10@5.35
Chestnut	5.55	5.00@5.55	5.60	5.10@5.60
Pea	3.50	3.25@3.50	3.55	3.50@3.55
Buckwheat	2.75	2.25@2.75	2.80	2.25@2.80
Rice	2.25	1.85@2.25	2.30	2.00@2.30
Barley	1.75	1.50@1.75	1.80	1.75@1.80

Bituminous—There is a better feeling in the bituminous situation. Demand is stronger and there has been a general advance of from five to ten cents on nearly all grades. Dealers are encouraged but look for still greater changes for the better.

The question of cars is becoming serious and operators are now feeling the scarcity of labor more than ever before. New contracts are being entered into with some hesitancy because of these conditions.

Mine prices for line trade are in some instances, much stronger than for tidewater shipments. Consumers are taking everything possible on their contracts and some large manufacturers are wiring for prompt shipments. The local docks have no accumulation and the harbor is comparatively free of demurrage coals.

Shipments of export coal are being restricted by a shortage of bottoms. The demand contines heavy but the inability to close contracts for vessels is causing shippers to hold off.

Quotations on various grades, per gross ton, f.o.b. Tidewater, are as follows:

	South Amboy	Port Reading	St. George	Mine Price
Georges Creek Big Vein	$3.20@3.30	$3.20@3.30	$3.20@3.30	$1.75@1.85
Georges Creek Tyson	2.95@3.00	2.95@3.00	2.95@3.00	1.40@1.45
Clearfield:				
Medium	2.65@2.80	2.55@2.65	....	1.10@1.25
Ordinary	2.55@2.60	2.55@2.60	....	1.00@1.10
Broad Top Mountain				1.10@1.45
Cambria County:				
South Forks	2.90@3.05	....	....	1.35@1.50
Nanty Glo	2.75@2.80	....	....	1.20@1.25
Barnesboro	2.65@2.70	....	....	1.10@1.15
Somerset County:				
Quemahoning	....	2.80@2.90	2.80@2.90	1.25@1.35
Medium	2.65@2.70	2.65@2.70	2.65@2.70	1.10@1.15
Latrobe	2.45@2.55	....	....	.90@1.00
Greensburg	2.75@2.80	....	....	1.10@1.15
Westmoreland	3.15@3.20	....	....	1.40@1.50
West Virginia Fairmont ¾		2.70@2.80	2.70@2.80	.90@1.10
Fairmont mine-run		2.60@2.70	2.60@2.70	.80@ .90
Steam		2.45@2.50	2.45@2.50	.90@ .95
Western Maryland		2.35@2.40	2.35@2.40	.85@ .90

PHILADELPHIA

Cold weather helps anthracite. Prices show indication of recovery, although cheap coal is still to be had. All steam sizes in fair demand, and some manufacturers begin to stock. Bituminous prices slightly higher. Export business quiet, but outlook is favorable.

Anthracite—The change in the weather has brought about the favorable conditions expected, but too late to prevent September being classed as a most unsatisfactory month. However, the closing days find orders coming into the operators at last. Retailers report that almost every order is urgent. This substantiates the contention that the cellars are practically empty and that the consumer would not buy until absolutely forced.

This week broken coal has been in strong demand and manufacturers who use this size are beginning to look to the future. Egg and stove are also in very fair demand and at good prices, while even chestnut shows indications of improvement. Of course this latter size is still quite low in price and the prospects are that it will not show any better figure so long as the circular price is so out of keeping with the other prepared sizes.

The steam sizes have very materially improved and seem to be in quite active demand as compared with last week. On special grades it has been impossible to fill the orders due partially to the fact that excessive flooding of the mines this summer resulted in a larger proportion than usual of the small sizes being used right at the colliery. The trade is also beginning to give more than passing attention to the suspension talk and have come to the conclusion that the demands of the miners are very liable to at least cause some unsettling of the business. For this reason a manufacturer here and there is putting a car or so of steam coal aside for an emergency.

While the prices on practically all sizes show a tendency to strengthen, that there is still cheap coal in the market, and it will take a month of real fall weather to eliminate it. Better prices are coming without a doubt, for even the individuals are now asking a higher figure for pea coal. At the present time $2 is the best price obtainable, although we note one instance where $2.25 has been obtained all summer for a special coal of this size.

The Western market for anthracite is now awake and has strengthened local conditions very materially.

That there is great faith in a good winter's business is demonstrated in a measure by the buildng of four large modern yards in the Germantown and Chestnut Hill section of the city. It has been many years since so much building activity has existed among coal dealers in one section of the city.

Quotations per gross ton, exclusive of the Pennsylvania state tax of 2½%, f.o.b. at mines and on vessels at the Port Richmond piers are:

	Line	Tide		Line	Tide
Broken	$3.50	$4.75	Pea	$2.50	$3.25
Egg	3.75	5.00	Buckwheat	1.25	2.25
Stove	4.00	5.00	Rice	.85	1.75
Chestnut	4.15	5.25	Barley	.50	1.50

Bituminous—Last week's gradual improvement continues, with the greatest demand being for the high volatile coals. The quiet recovery of the trade seems to be satisfactory to the shippers and the belief continues that we are on the verge of a good season and possibly an exceptional one. There has been some slight increase in prices and this gradual rise is expected to continue as the demand increases. Shippers are urging consumers to stock coal and in some instances their advice is being followed. No sales of large tonnage are reported, as operators are not inclined to commit themselves on large tonnages at prevailing prices, although tenders to this end are frequently made.

The prevailing prices for the week, per gross ton, are as follows:

Georges Creek Big Vein	$1.65@1.75	Fairmont gas, ¾	$1.20@1.30
South Fork Miller Vein	1.50@1.60	Fairmont gas, mine-run	1.05@1.15
Clearfield (ordinary)	1.10@1.20	Fairmont gas, slack	.70@ .80
Somerset (ordinary)	1.05@1.15	Fairmont lump, ordinary	.95@1.05
West Va. Freeport	.90@1.00	Fairmont mine-run	.85@ .90
		Fairmont slack	.60@ .70

BALTIMORE

Demand well sustained, car and labor shortage developing and prices slowly improving. Exports checked by lack of vessels.

Both labor and car supply grow more unsatisfactory and the price list is stiffening. Many mine interests are now complaining of a shortage of men. Operations are also restricted by the car shortage and orders are piling up. There is no longer any doubt that a decided stiffening to the market is under way.

The anthracite market is also improving. Nearly all dealers report an increasing demand now that cooler weather has set in. The demand so far centers largely on household sizes, and pea and nut coal are in especially good demand. An extremely busy fall is looked for as many householders who ordinarily have their supplies by this time failed to put in coal the past summer.

While there is now some little varience due to immediate necessities, prices per short ton to the trade at the mines and outside the Capes deliveries are:

	Mines	Balt.*	Fairmont	Mines	Balt.*
Geo. Crk. Big Vein	$1.75	$2.93	Ordinary mine run	$0.85	$2.28
Geo. Crk. Tyson	1.40	2.58	Ordinary ¾	.95	2.38
Clearfield	1.25	2.43@2.48	Ordinary slack	.65	2.08
South Fork	1.40	2.58	Low sulphur mine-run	1.10	2.53
Latrobe	.95	2.13	Low sulphur ¾	1.25	2.68
Somerset (best)	1.35	2.53	Low sulphur slack	.75	2.18
Somerset (good)	1.20	2.38			
Quemahoning	1.30	2.48@2.53			
Freeport	.85	2.03@2.08			
Miller Vein	1.10	2.28@2.33			

*F.O.B., outside Capes.

HAMPTON ROADS

Export shipments holding up well. Fair movement coastwise. Temporary accumulation at Tidewater.

Dumpings over the local piers have shown up well, especially to Italy and various South American countries, while the coastwise movement has been fair with cargoes to a large number of the New England ports and some shipments South.

The accumulation of coal on the railroad yards is perhaps somewhat in excess of normal and there may be some free coal. A number of the shippers, however, have a considerable quantity of vessel tonnage about due and with that now in port the beginning of the week will see a considerable reduction in the quantity now on hand. Prices are practically unchanged on the standard grades.

Railroad Tonnages—Dumpings over the local piers for the past five weeks compare as follows:

Railroad	Week Ending Aug. 28	Sept. 4	Sept. 11	Sept. 18	Sept. 27
Norfolk & Western	211,699	232,394	156,459	182,047	163,400
Chesapeake & Ohio	103,472	82,485	93,260	87,680	91,341
Virginian	82,131	72,302	70,855	59,597	79,176
Totals	397,302	387,182	320,574	329,336	333,917

OCEAN FREIGHTS

The freight market is stronger than a week ago, and steamers are in demand for grain at higher figures than recently paid. It is rumored that three steamers have been chartered for coals to the West Coast of Italy at $11.04, and but few steamers are offering, as the owners prefer grain at rates now obtainable, but occasionally there are boats willing to accept coal at less than market rates.

We quote freight rates on coal by steamer as follows:

To	Rate	To	Rate
Havana	$2.50@2.75	Bermuda	$3.00
Cardenas or Sagua	2.75@3.00	Vera Cruz	3 50@3.75
Cienfuegos	3.00@3.50	Tampico	3 50@3.75
Port au Spain, Trinidad	3.75	Rio	8.28@8.40
St. Lucia	3.50@3.75	Santos	8.40@8.64
St. Thomas	3.25@3.50	Montevideo	8.16
Barbados	3.75	Buenos Aires or La Plata	8.16@8.28
Kingston	2 75@3.25	Rosario	8.40
Curacao	3.25	West Coast of Italy	11.04
Santiago	2 75@3.25	Barcelona	10.32
Guantanamo	2.75@3.25	Valparaiso or Callao	7.25@ 7.50
Demerara	5.00@5.50	Marseilles	10.56

* Consignees paying dockage dues. ** Spanish dues for account. † Quotations on Plate coal by British steamers; neutral steamers are more difficult to obtain and the rates are always higher.

W. W. Battie & Co.'s Coal Trade Freight Report.

Note—Charters for Italy, France and Spain read: "Lay days to commence on steamer's arrival at or off port of discharge. 24c. per net register ton per day demurrage."

LAKE MARKETS

PITTSBURGH

Definite car shortages appearing. Operations no heavier. Cooler weather. Lake shipments scarcely improved. Free coal steady with contract market a shade easier.

It is stated that not a single mine was able to operate on the Pan Handle division last Saturday, on account of there being no cars. While few of the mines have had orders sufficient to operate six days in the week the lack of cars proved a decided inconvenience. On nearly all divisions the supply is now scant and coal shippers attribute the scarcity to a decrease in the supply much more than to an increase in the coal shipments. Mining operations in the Pittsburgh district as a whole are at between 65 and 70% of capacity.

Cooler weather has given a slight impetus to the retail coal demand but the trade is still relatively quiet in this quarter. The iron and steel industry continues to consume a maximum supply of coal and is certain to be a very heavy consumer throughout the winter. The line demand generally is fair, while railroad consumption has increased. Lake shipments, while somewhat heavier than a month ago are still comparatively light and the rush in coal shipments expected for the closing period of the season is hardly likely to be experienced. The ore trade is now under such pressure that many boats are going up the Lakes light, in order to get in an extra ore cargo or two during the balance of the shipping season.

Prices for free coal retain their recently acquired firmness, but on contract to Apr. 1 the market is if anything a shade easier again, though not as low as a couple months ago. We quote for prompt shipment: Slack, 50@60c.; nut and slack, 90@95c.; nut, 95c.@$1; mine-run, $1.05; ¾-in., $1.15; 1¼-in., $1.25. On contract to Apr. 1: Slack, 85@95c.; mine-run, $1.15; ¾-in., $1.25; 1¼-in., $1.35, per net ton at mine, Pittsburgh district.

BUFFALO

No activity in anthracite and none expected till the weather is colder. Bituminous improves as the hot weather subsides. Prices quite strong. Fall trade promises to be good.

Bituminous—All reports agree that conditions grow steadily better. The demand is increasing and the car shortage is already making the consumer a trifle anxious and with the crops just beginning to move this may be increased soon. Certain mines that have been running four or five days a week are now preparing to go on full-time schedules. The Eastern demand is much better than it was, but there is no particular improvement in Canada.

Quotations on best grades, f.o.b. Buffalo, are:

	Pittsburgh	Allegheny Valley	Pennsylvania Smokeless
Lump	$2.65	$2.45	$2.55
Three-quarter	2.50	2.25	....
Mine-run	2.40	2.15	2.30
Slack	2.05	2.00	2.30

Quotations and freight rates to points east of Rochester, N. Y., and Kingston, Ont., are per long ton and balance of this territory is on the short-ton basis.

Anthracite—There is very little stir anywhere yet, though the trade feels that it must be near. It is the general opinion that there is less in consumers' hands now than has been the case in a long time and there is some eagerness to get started. There has been rather more coal sold by the independent companies than usual, but they have not failed to cut the circular price if necessary to do business. Concessions in this territory rule from 10 to 25c. off the circular, some being reported sold at April prices.

Quotations, f.o.b. cars at Buffalo, or in trestle to retailers, is $5.60 for lump, $5.85 for egg and stove, $6.10 for chestnut and $4.30 for pea, with 25c. additional for delivery on board vessel, all per gross ton of 2,240 lb.

TORONTO, CAN.

Industrial demand light and trade continues quiet.

Trade is quiet and featureless with ample supplies on hand. Manufacturing in nearly all lines continues inactive with little indication of any improvement for some time, though hopes are entertained that the good harvest may bring about a revival. Prices per short ton for best grades remain unchanged as follows: Retail, anthracite, egg, stove and nut, $7.75; grate, $7.50; pea, $6.50; bituminous, steam, $5.25; screenings, $4.25 to $4.50; domestic lump, $6; cannel, $8. Wholesale, bituminous, f.o.b. cars at destination, three-quarter lump, $3.56; screenings, $3.

COLUMBUS

Warmer weather makes the coal trade quiet, especially in domestic lines. Prices are still well maintained and the tone of the market is good.

There is a lull in the demand for domestic grades, due to warmer weather and retailers are holding up shipments, while orders are a little harder to book. But the tone of the trade is still good and future prospects are believed to be bright. The present relapse is regarded as only temporary.

Domestic business slowed up especially under the pressure of higher temperatures. Dealers are not placing orders so promptly, and some have even requested that shipments be held up. The better weather has permitted farmers to look after their fall work and they are not hauling coal at present. Prices are firm at the levels which have prevailed for the past few weeks. Considerable Hocking lump is now being stocked.

The Lake trade is rather slow although a considerable tonnage is going to the Northwest via the Lakes. At the Toledo docks of the Hocking Valley a total of 70,000 tons was loaded the week ending Sept. 24, but a large part of this came from West Virginia. Chartering is going on and there will be considerable activity from now until the close of navigation.

Prices in Ohio fields are as follows in short tons, f.o.b. mines:

	Hocking	Pomeroy	Eastern Ohio	Kanawha
Re-screened lump	$1.50	$1.60		
Inch and a quarter	1.40	1.45	$1.30	$1.30
Three-quarter inch	1.25	1.35		1.25
Nut	1.15	1.25		1.15
Mine-run	1.05	1.10	1.00	1.05
Nut, pea and slack	.65	.65	.50	.60
Coarse slack	.55	.55	.40	.50

Mines have been working at about the following percentages of full capacity:

	Week Ended					Week Ended			
District	Sept. 4	Sept. 11	Sept. 18	Sept. 25	District	Sept. 4	Sept. 11	Sept. 18	Sept. 25
Hocking	45	40	45	50	Cambridge	40	44	45	45
Jackson	20	25	25	25	Massillon	40	40	45	45
Pomeroy	50	50	60	75	Eastern O.	60	60	70	75
Crooksville	35	35	40	40	Average	41	42	47	50

CLEVELAND

Slack prices noticeably stronger. Coarse coals generally unchanged.

Fine-coal prices are five to fifteen cents higher than a week ago. The market is exclusively supplied with Ohio coals with the exception of a few cars of Pennsylvania. The high prices asked by the Pennsylvania and the West Virginia operators are keeping those coals out of the market.

Supplies are not large and receipts are below the average of the last six weeks. There is very little call for most coarse coals except the domestic sizes, which are being bought a little more liberally. The domestic trade is not very brisk, and fluctuates with the weather.

The Lake trade is slowly improving. Up to Sept. 1 the Duluth grain shipments are fast reaching the high point of the season and Lake Superior coal docks are shipping accordingly. The Canadian trade is taking considerably more coal than it did. The Lake business will be better from now on until the middle of November.

Jobbers are paying the following prices per net ton, f.o.b. Cleveland:

	Pocahontas	Youghiogheny	Fairmont	Bergholz	Ohio No. 8
Lump	$3.70				
Lump, 6-in.				$2.30	
Lump, 1¼-in.		$2.30		2.10	$2.15
Lump, ¾-in.		2.20	$2.00	2.00	1.95@2.00
Egg	3.70			1.95	
Mine run	2.80	2.10	1.90	1.85	1.85
Slack		1.80	1.85	1.65	1.65@1.70

DETROIT

Slow but regular gains in steam coal. Weather adverse for domestic sizes. Anthracite distribution slow. Shipments by Lake route are less.

Bituminous—While the present situation in Detroit cannot be considered as strong, there is enough activity in steam coal to indicate a definite improvement. Sales are showing a slight increase in volume. The number of inquiries and orders, from towns in Michigan, outside Detroit, indicates a better condition. This together with the gradually broadening local market is maintaining prices. The problem of dealing with speculative shipments dumped in the local market by various operators, still exists, though in less vexatious form than a month ago. Few of the coal consumers are accumulating reserve stocks, despite the warning from shippers that car shortage and weather condition may seriously interfere with deliveries later.

Anthracite—Retail dealers are not coming forward with orders as rapidly as shippers had expected. This is attributed to a belated buying on the part of the consumers. There was considerable activity in distribution early this month but buyers now seem less eager. A slowing down in the Lake movement of both anthracite and bituminous is forecasted for the remainder of the navigation season. Practically all freighters are in commission, the demand in the grain and ore carrying trades is so great that a number of owners are sending their vessels on upbound trips, without cargoes.

TOLEDO

Steam coal fairly steady but other grades are dull and heavy. Closing of Sunday Creek mines causes a better feeling in the market.

There is some change for the better, especially in steam coal. Pocahontas is more plentiful than it was but the call is light and prices are inclined to show some weakening. There is some little demand for Pittsburgh No. 8, which for a time was practically a dead issue. The Ohio mines are generally quiet but some of the Hocking Valley operators are fairly well supplied with orders. The closing of the Sunday Creek mines in that territory has made a better demand for some of the independent mines. Considerable coal is coming in to the local docks, and an increased volume from Hocking territory, but the Lake movement generally is light as compared with other seasons.

Following are the price quotations, f.o.b. mine, per short ton:

	Pocahontas	West Virginia	Hocking	Pomeroy	Jackson	Kentucky	Massillon No. 8
Lump.......	$2.25	$1.40 @ $1.85	$1.50	$1.65	$2.50	$1.75	$1.35
Egg.........	2.25	1.00 @ 1.25	.....	.....	2.50	1.25	1.20
Mine run....	1.40	.85 @ 1.00	1.10	1.10	.....	.90@$1.10	1.10
Nut.........	.....	.90 @ 1.15	1.25	1.25	.....	.90@ 1.15	.....
Nut, pea and slack......	.....	....	.65	.65	.60	.40@ .60	.60@ .75

CINCINNATI

Warm weather slows down the domestic demand materially. Steam coal remains weak and in slow demand. Car supply is not good.

While it is rather early in the season for a weather market to be reported, it remains a fact that the unexpectedly warm weather of the past week exerted a marked influence. Price concessions are still reported. The car supply is short apparently, but there are still enough cars to forward more coal than the market can readily absorb. Industrial activity is limited to the iron, steel and machinery trades, and these are not sufficient to create an active market for screenings and run-of-mine.

LOUISVILLE

Warm weather and heavy shipments cause a relapse. Some car shortage and outlook in this respect rather ominous.

The recent warm weather, combined with the accumulations due to the heavy shipments of the latter part of August and the first part of September have flattened the market. Shipments have outstripped the demand and the market is long both on domestic and steam sizes, especially the latter. In the western Kentucky field the steam coals are particularly slow; it is reported that one operator is trying to give away 30 cars of screenings for the freight and that he is offering to sell this grade on contract up to Apr. 1 at 15c. a ton, f.o.b. the mines.

Prices, f.o.b. the mines, have ranged during the past week on the following basis per long ton: Block, from $1.60 to $2.25; egg, $1.20 to $2.40; nut and slack, 20 to 40c. and 50 to 65c.

COKE

CONNELLSVILLE

Negotiations continue on furnace coke contracts for first half. Prompt coke a shade firmer. Production and shipments approximately stationary.

Claire furnace in the Shenango Valley will blow in about Oct. 1, on coke contracted for a few weeks ago. Otherwise there is no definite increase in merchant coke consumption in sight. Two or three consumers who were not covered for the year on contract have lately bought for the remainder of the year at $2 and $2.25, and the principal business before the market is now the first half of the new year. On this position there is considerable negotiation but buyers and sellers are not getting together rapidly. Sliding scales have been much discussed but there remains a possibility that a regular movement may start on a flat price basis, perhaps on a basis between $2.25 and $2.50. The lower figure has already been bid but turned down by makers of high-grade coke. Prompt furnace coke continues in very light demand, but offerings are also light and the market seems a shade firmer. We quote: Prompt furnace, $1.65@1.75; contract furnace to Dec. 31, $2@2.25; prompt foundry, $2.30@2.60; contract foundry, $2.40@2.60, per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Sept. 18 at 382,467 tons, a decrease of 5,236 tons, and shipments at 390,290 tons, an increase of 1,428 tons.

Buffalo—The market grows stronger week by week, on account of the activity in the iron trade. The demand is everywhere good and the outlook is most encouraging. As the Lake season proceeds into its last quarter and ore movements sometimes slack off the call for tonnage increases. Prices are very firm on the basis of $4.30 for best 72-hr. Connellsville foundry, with $3.35 for stock coke.

Chicago—The coke situation from all points of view is in a better position now than it has been at any time in several years. The trend is still upward, and selling prices may soon be higher. The lively demand for steel products is resulting in heavily increased demand for furnace and foundry coke, while the retail trade for byproduct sizes has quickened. Gashouse demand is quiet. Quotations f.o.b. cars Chicago per net ton are as follows: Byproduct foundry, $4.90@5.10; byproduct domestic, $4.75; Connellsville, $4.85@5; Wise County, $4.75@5; gas coke, $3.85@4.

MIDDLE WESTERN

GENERAL REVIEW

Domestic buying brisk. Eastern coals easier. Car supply begins to tighten. Screenings weaker. Anthracite slow.

The weather became markedly cooler with frosts in some localities early this week, which has given renewed vigor to the market. Prices are generally steady although there are spots where they have been cut. Steam coals, particularly screenings, have shown weakness, declining as much as 40c. for the Southern Illinois product. Indiana screenings show more resistance. Car shortages are in evidence, and some Illinois mines have lost one or two days this week. Increased buying of domestic sizes 's in evidence and but little cheap coal is being offered. An increasing number of railroads are stocking up in order to take advantage of available equipment and to have the coal ready for any emergency.

Interior retailers have taken but little coal from the docks during the past week. Northwestern prices remain unchanged, but a goodly tonnage of Illinois coals has been moving toward that territory. Orders from dealers in Western states such as Iowa, Nebraska, Minnesota and the Dakotas are growing, and will show an increase from now on. They bought practically nothing last year, and have delayed purchases this year and the immense crops with good prices, assures an abnormal volume of orders. Contrary to the situation in other parts of the state, it is said that most of the retail dealers in northern Illinois are well stocked.

CHICAGO

Circulars more firmly maintained situation in Indiana notably firmer. Smokeless market mixed Kentucky and Hocking coals strong.. Anthracite slow opening up.

Franklin County operators are adhering strictly to the circular of $1.75 on lump, egg and No. 1 nut, while Williamson County shippers are averaging around $1.60 for these sizes. The over-production of steam coals in this section has caused a decline in screenings which have averaged 50c. per ton. Williamson County operations are behind orders, and are finding a very wide market for their coal. The higher priced steam sizes of Franklin County are heavy but Saline County screenings are stronger, and quite a tonnage has been sold here at from 60c. to 70c.

The situation in the Indiana field is much improved. Domestic demand has a better tone and quite a number of manufacturing plants will soon start operations again, which will insure a better call for steam coals. Some of the operators state that $1.70 to $1.75 will be a firm price on domestic lump from Nos. 6 and 4 mines during October. Third and Fifth Vein steam shipments have been of moderate volume while screenings have steadily brought from 60c. to 75c.

The smokeless situation is still a mixed one, and spot buying prices have been less than circular figures. On direct shipments from the mines the major producers are maintaining a price of $2.25 for genuine No. 3 vein lump and egg, but spot shipments of these grades have been sold as low as $1.85. The mine-run situation with the splint producers is in much better condition, although the splint demand generally is still quiescent. It is said the Lake movement is becoming heavier and generally more satisfactory.

Production at eastern Kentucky mines during the past several weeks has been heavier than during any previous year in the history of the state, and there is now a gradual improvement in prices and demand. Sporadic car shortages are already in evidence. Higher selling prices on all grades are confidently expected this month. L. & N. mines are reported sold up to capacity.

Very little anthracite coal has been ordered recently, due mainly to the mild weather. Indifference still rules among the dealers, and colder weather will be needed to put new life into the trade and induce stocking.

Quotations in the Chicago market are as follows:

	Williamson and Franklin Co.	Springfield	Sullivan	Clinton	Knox and Greene Cos.
Lump	$1.60@1.75	$1.50@1.65	$1.50@1.60	$1.35@1.50	$1.40@1.50

ST. LOUIS

Franklin County mines forced to decline lump orders. Lump coals from inner group heavy. Dealers delay buying.

The demand for the higher grades of lump, from the outer group of mines, is stronger, due to the filling of the cellars and the laying in of stocks by dealers in anticipation of a still better domestic demand. This has caused weakness in the finer grades for steam use. Lump from the inner group, on the other hand, is a drug on the market because the warm September weather has enabled the less prosperous element to hold off laying in their winter's supply. The operators, in anticipation of the usual run of September orders, shipped in heavily at the first of the month and loaded the tracks. Screenings show some activity and the minimum is 35c.

The following are mine prices per net ton:

	Staunton	Collinsville	Sparta	Standard
6-in. lump	$1.35@1.50	$1.20@1.35	$1.15@1.25	$1.15@1.20
3 x 6 egg	1.15@1.30	1.10@1.25	1.00@1.10	.90@1.00
2-in. lump		1.15@1.20	1.10@1.20	.95@1.00
No. 1 nut	....	....	....	.75@.85

DULUTH

Shipments of bituminous about normal. Anthracite movement lighter.

Shipments of bituminous coal are well up to the average for this season of the year, the demand from the elevators and the line companies operating throughout the Northwest being quite brisk. There is also a disposition on the part of the railways running out of the head of the lakes to increase their purchases. Shipments of all grades of coal for the month of August amounted to 18,075 cars, showing an increase over July of 5,220 cars, a healthy and a normal improvement. The total shipments made for the year ending Aug. 31 are 128,563 cars, as compared with 141,379 cars during the same period last year, or a decrease of 12,816 cars.

Quotations f.o.b. docks, per short ton, are as follows:

	Yough	Splint	Hocking	Smokeless	Elkhorn	Millers Creek
Lump	$3.40	$3.40	$3.40	$4.75	$3.75	$3.65
Dock-run	3.10	3.10	3.05	3.25	3.25	3.35
Stove or nut	3.40	3.40	3.40	4.75	3.65	3.65
Scgs	2.40	2.40	2.25	2.75	2.40	2.40

Very little business is being done in the anthracite trade, due to the very fine June-like weather. It being next to impossible to induce consumers in this section to stock up as long as it is not necessary to have a fire going. Dock companies quote f.o.b. cars their docks, per short ton as follows: Egg and stove $6.85, nut, $7.10, pea, $5.55; buckwheat, $4.

PRODUCTION AND TRANSPORTATION STATISTICS

VIRGINIAN RAILWAY

Shipments of coal over the Virginian Ry. for the month of July amounted to 381,853 net tons, as compared with 301,932 tons in June.

EXPORTS

Exports of domestic coal and coke from the United States, and bunker coal laden on vessels engaged in the foreign trade at the specified districts, during the month of July, 1915, were as follows:

Total	2,529,964	3,114,608	18,218,522	19,281,192

FOREIGN MARKETS

GREAT BRITAIN

Sept. 10—Business is generally quiet for prompt positions, but there is prospect of a more active demand. Quotations are approximately as follow:

Best Welsh steam	Nominal	Best Monmouthshires	$5.52@5.76
Best seconds	Nominal	Seconds	5.04@5.28
Seconds	$5.52@5.76	Best Cardiff smalls	4.20@4.44
Best dry coals	5.52@5.76	Cargo smalls	2.64@2.88

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport, both net, exclusive of wharfage.

Freights—Chartering is more active and with tonnage offering more freely, rates show some irregularity and are approximately as follow:

Gibraltar	$4.78	Naples	$6.96	St. Vincent	$4.32
Marseilles	6.47	Alexandria	7.20	Rio de Janeiro	5.28
Algiers	5.40	Port Said	7.20	Monte Video	5.04
Genoa	6.96	Las Palmas	4.08	Buenos Aires	5.28

Coal Contracts Pending

The purpose of this department is to diffuse accurate information of prospective purchases and prices with a view to affording equal opportunity to all, promoting market stability and inculcating sound business principles in the coal trade.

Recast

In the following table we give a list of all old contracts coming up for consideration during the ensuing week. The table gives our contract number, the name of the purchaser, city, tonnage and page on which the detail notice appeared.

No.	Purchaser	City	State	Tonnage	Page
1321	Marshall County	Plymouth	Ind.	280b	530
1436	Emmons Bd. of Com'rs.	Linton	N. D.	70b	490

a Indicates anthracite coal. b Indicates bituminous.

Supplemental Notes

Under this heading additional or supplemental information regarding old contracts appears, together with the page number of the original notice.

+No. 866—Cleveland, Ohio—Bids on this contract (Vol. 7, p. 1085), which provides for furnishing the fuel requirements of the local Water-Works Department, will be received until Oct. 14 instead of Sept. 15 as was originally announced. It is rumored that the old contract will be renewed if the same price can be obtained. Address City Purchasing Agent, Water-Works Dept., Cleveland, Ohio.

1047—Kansas City, Mo.—It is understood that William Volker & Co. have reconsidered their intention of contracting (pp. 116, 489). The firm has not placed any orders since July, and are not in the market at the present time. Address Purchasing Agent, William Volker & Co., Main and Second Sts., Kansas City, Mo.

1080—Kansas City, Mo.—The packing firm of Morris & Co. announce that they have decided to confine their fuel purchases involving from 750 to 1,200 tons per week (p. 117), to the open market. Address Purchasing Agent, Morris & Co., Kansas City, Mo.

1107—Kansas City, Mo.—The fuel requirements of the Densmore Hotel, involving approximately 300 tons of slack (p. 157), will be bought in the open market instead of contracted for as previously noted. Address Purchasing Agent, Densmore Hotel, 912 Locust St., Kansas City, Mo.

1178—Cumberland, Md.—The requirements on this contract (p. 243), which provides for furnishing the local Board of Education with its coal requirements, are approximately as follows: Cumberland schools, 500 tons; Mt. Savage school, 40 tons; Eckhart school, 250 tons; Midland and Ocean schools, 75 tons; Lonaconing schools, 187 tons; Barton school, 75 tons; Westonport and Luke schools, 140 tons. Bids were received until Sept. 29 and only Georges Creek Big Vein coal will be considered. Address Sept. John E. Edwards, Bd. of School Coms., No. 7 Union St., Cumberland, Md.

1313—Boston, Mass.—It is understood that the Boston & Maine R.R. has decided not to accept any of the tenders made on this contract (p. 867). The present contract has a considerable time to run yet, and it is probable that nothing further will be heard in regard to this contract until at least next year. Address B. S. Hinckley, Boston & Maine R.R., Boston, Mass.

1404—New Orleans, La.—This contract (p. 448), which provides for furnishing the New Orleans Cotton Exchange with its winter supply of coal, will involve approximately 100 tons. Address Secy. H. G. Hester, New Orleans Cotton Exchange, New Orleans, La.

1444—New Orleans, La.—The contract for supplying the American Brewing Co. (p. 490), does not expire until the end of December instead of at the present time as previously announced. Address Ed. G. Schleider, American Brewing Co., New Orleans, La.

New Business

+1480—Massillon, Ohio—The Board of Educaion at this place received bids until noon, Sept. 29, for furnishing and delivering coal as may be required during the coming school year. Bids were requested on Goshen and Massillon mine-run, lump and slack. Address Clk. William Fielberth, Bd. of Edu., Massillon, Ohio.

+1481—Mandan, N. D.—The Board of Education will receive bids until 8 p.m., Oct. 4, for furnishing approximately 200 tons of screened, deep-mined lignite coal to be delivered at the various school houses. All bids must be accompanied by certified checks for $25. Address Clk. J. H. Noakes, Bd. of Edu., Mandan, N. D.

1482—Louisville, Ky.—The contract for furnishing the Columbia Building with from 100 to 125 tons of coal per month expires during the current month. Address Mgr. Columbia Bldg., Fourth and Main St., Louisville, Ky.

+1483—Annandale, Minn.—Bids will be received by School District No. 71 for furnishing and delivering two carloads of Pocahontas coal as may be required during the ensuing year. Address Clk. N. C. Smith, School Dist. No. 71, Annandale, Minn.

+1484—Sunbury, Penn.—The County Controller will receive bids until 11 a.m., Oct. 4, for furnishing and delivering 250 tons of anthracite pea coal to the local Court House; 125 tons are to be delivered at once and the balance as required. All bids must be accompanied by a certified check for $200. Address Controller Aaron Baker, Court House, Sunbury, Penn.

+1485—Rock Falls, Ill.—The Rock Falls Electric Light Plant usually contracts for its annual fuel supply, involving approximately 1,800 tons of mine-run coal, about Nov. 1. The business is done on a competitive basis, and the customary price is about $2.20 per ton. Address Supt. O. M. Aarvig, Rock Falls Electric Light Plant, Rock Falls, Ill.

+1486—Cooperstown, N. D.—The Griggs County Commissioners will receive bids on Oct. 4 for furnishing and delivering to the local Court House 40 tons of anthracite stove coal, 20 tons of Hocking Valley and 20 tons of Pocahontas. Address County Audr. H. S. Rearick, Cooperstown, N. D.

1487—Canton, Ohio—The Carnahan Tin Plate Co. usually contracts for its annual fuel requirements, involving approximately 24,000 tons of mine-run coal, about Nov. 1. Deliveries are required at the rate of two cars per day. Address Secy. and Treas. Roy Carnahan, Carnahan Tin Plate Co., Canton, Ohio.

+1488—Eau Claire, Wis.—The Board of Education at this place received bids until 5 p.m., Sept. 27, for furnishing and delivering approximately 500 tons of West Virginia splint, Kentucky block, Pocahontas smokeless or anthracite pea coal to the local school buildings. Address Secy. Emma Schroeder, Eau Claire, Wis.

+1489—Trenton, N. J.—Bids were received until 10 a.m., Sept. 30, for furnishing the coal requirements at the State Home for Girls as may be required during the period beginning Nov. 1 of this year and ending Apr. 30 of next year. Address Supt. (Mrs.) E. V. H. Mansell, New Jersey State Home for Girls, Trenton, N. J.

+1490—Leetonia, Ohio—The Board of Public Affairs will receive bids until 7 p.m., Oct. 5, for furnishing and delivering mine-run, screened, nut and slack coal to the pumping station of the local water-works as may be required during the ensuing year. Address Clk. Jacob Kuegle, Bd. of Pub. Affairs, Leetonia, Ohio.

1491—Louisville, Ky.—The contract for furnishing the fuel supply of the Bradford Mills, a branch of the American Wool Co., expires on Nov. 1. The present contract is held by the James Coal Co. and involves about one car of nut and slack coal per week. Quotations should be made f.o.b. the Germantown switch. Address Purchasing Agent, Bradford Mills, Dandridge and Reutlinger Ave., Louisville, Ky.

+1492—Vintondale, Penn.—The School Board at this place received bids until Sept. 30 for furnishing and delivering coal to the local school buildings as may be required during the ensuing year. Address Secy. George S. Blewett, Vintondale, Penn.

+1493—Jacksonville, Fla.—The City Government will receive bids until 8 p.m., Oct. 4, for furnishing and delivering approximately 150 tons of the best anthracite egg coal and about 85 tons of bituminous for use at the city buildings, fire and police stations. Address Pur. Agt. R. N. Ellis, City Hall, Jacksonville, Fla.

+1494—Grand Forks, N. D.—The City Government will receive bids until 4 p.m., Oct. 4, for furnishing coal approximately as follows: 2,000 tons of Youghiogheny screenings, 100 tons of anthracite chestnut, 200 tons of Youghiogheny or Hocking lump, 100 tons anthracite stove or egg. All proposals must be accompanied by a certified check for $200. Address City Audr. W. H. Alexander, Grand Forks, N. D.

+1495—Ashtabula, Ohio—The Ashtabula County Commissioners will receive bids until 1 p.m., Oct. 5, for furnishing lump coal for the county buildings at Kingsville and Jefferson during the year beginning Oct. 15. Quotations should be on the basis of a net ton f.o.b. cars at Kingsville and Jefferson. Address Clk. B. E. Brainard, Board of County Comrs., Ashtabula, Ohio.

+1496—Virginia, Minn.—The City Government received sealed bids until 8 p.m., Sept. 28, for furnishing and delivering approximately 100 tons of either Pocahontas or anthracite buckwheat, egg, nut or stove coal. Address City Clk. Albert E. Bickford, Virginia City, Minn.

1497—Cleveland, Ohio—The City Government will receive bids until noon, Oct. 6, for furnishing coal for the Department of Public Utilities, Division of Water. All bids must be submitted on blank forms that may be obtained on application. Address Comr. of Purchases and Supplies A. R. Callow, 511 City Hall, Cleveland, Ohio.

1498—Louisville, Ky.—The contract for furnishing the Fall City Brewery with its fuel requirements, involving three or four carloads of nut and slack coal per week, will expire on Nov. 1. Deliveries are made by rail. Address Purchasing Agent, Fall City Brewery, 29th and Broadway, Louisville, Ky.

1499—New Orleans, La.—The Presbyterian Hospital at this place will contract some time during the current month for its annual fuel supply, involving approximately 700 tons. Address Purchasing Committee, Presbyterian Hospital, 719 Carondelet St., New Orleans, La.

+1500—Punxsutawney, Penn.—The Board of Education at this place will receive bids until Oct. 11 for furnishing mine-run coal as may be required. Address Secy. W. A. Sutter, Punxsutawney Bd. of Edu., Punxsutawney, Penn.

1501—New Orleans, La.—The Crescent Bed Co. is considering bids for furnishing approximately 200 tons of mine-run coal, the purchase to be negotiated from the mines. Address Pur. Agt. Peter Jung, Jr., Crescent Bed Co., Gravier and Broad St., New Orleans, La.

1502—Bismarck, N. D.—The State Board of Regents will receive bids until 2 p.m., Oct. 13, for furnishing coal to the various state institutions during the period until June 30, 1916. The tonnages required are: North Dakota Agricultural Colleeg, Fargo, 2,700 tons; State School of Science, Wahpeton, 700 tons; State Normal and Industrial School, Ellendale, 600 tons; State School of Forestry, Bottineau, N. D., 100 tons. The best quality steam coal is required and quotations should be f.o.b. railroad switch at the institution or the most convenient point thereto as will be designated. Bidders are required to specify the mines from which they propose to furnish coal, and also to give analysis. The successful bidder will be required to furnish a surety bond of not less than $1 per ton of coal contracted for. Bids will also be received for range coal in car lots at each of the points noted. Address Secy. Charles Brewer, State Bd. of Regents, Bismack, N. D.

1503—Covington, Ind.—The Fountain County Commissioners will receive bids until 2 p.m., Oct. 5, for furnishing coal as follows: For the County Farm, 200 tons; Courthouse, 100 tons; County Jail, 60 tons. The coal is all to be 4-in. screened lump and that for the Courthouse and Jail is to be delivered in the bins as required, all deliveries to be completed by Jan. 1, 1916. Bids are also requested for furnishing coal to the County Asylum and quotations on this business should be f.o.b. cars at Nebeker's station. Address Audr. Hyman W. Newlin, Fountain County, Covington, Ind.

1504—New Orleans, La.—The contract of the Swiss Steam Laundry at this place, involving approximately 600 tons of steam coal per annum, will expire on Nov. 1. Address Pres. L. P. Hakenjos, Swiss Steam Laundry, 1010 Gravier St., New Orleans, La.

+1505—Gilbert, Minn.—Bids were received until Sept. 27 for furnishing School District No. 18 with approximately 600 tons of Pocahontas mine-run and 200 tons of anthracite stove coal. Address Clerk, School Dist. No. 18, Gilbert, Minn.

+1506—Trenton, N. J.—Bids will be received by the New Jersey State Prison until 1 p.m., Oct. 13, for furnishing coal as required during the period from Nov. 1 of the current year to Mar. 31 of next year, at the following places: State Prison at Trenton, N. J.; State Road Camp No. 1 at Springfield, N. J.; State Road Camp No. 2 at Rocky Hill, N. J.; State Road Camp No. 3 at Elmer, N. J. All bids must be accompanied by a certified check. Address Fiscal Agt. J. P. McCormack, State Prison, Trenton, N. J.

1507—New Orleans, La.—The Dixie Laundry Co. of this place is requesting bids for furnishing its annual fuel requirements, involving approximately 100 tons of steam coal. Address Secy.-Treas. Max N. Kohler, Dixie Laundry Co., 1124 Tulane Ave., New Orleans, La.

+1508—Kansas City, Kan.—The City Government received bids until 9 a.m., Sept. 28, for furnishing approximately 400 tons of Cherokee lump coal. Address City Clerk, Kansas City, Kan.

1509—White Rock, S. D.—The County Commissioners will receive bids until noon, Oct. 5, for furnishing and delivering to the Court House 100 tons of Zenith screened steam coal, and also for furnishing, f.o.b. cars, 15 tons of anthracite coal for the county farm. Address County Audr. O. F. Lien, Bd. of County Comrs., White Rock, S. D.

1510—New Orleans, La.—The Louisiana Distilling Co. will receive bids for its fuel requirements at any time. Address Manager, Louisiana Distilling Co., 865 S. Peters St., New Orleans, La.

1511—Bedford, Ind.—The Lawrence County Commissioners will receive bids until Oct. 4 for furnishing and delivering approximately 100 tons of Black Creek coal to the poor farm. Address Audr. E. W. Edwards, County Comrs., Bedford, Ind.

1512—Portage, Penn.—The School Board at this place will receive bids until Oct. 2 for furnishing and delivering either Miller vein or C Prime vein coal as may be required during the coming school year. Address Secy. H. D. Border, School Bd., Portage, Penn.

1513—Virginia, Minn.—The Board of Education received bids until Sept. 27 for furnishing 1,000 tons of Youghiogheny screenings, 500 tons of buckwheat and 100 tons of stove coal. Address Secretary, Bd. of Edu., Virginia, Minn.

1514—New Orleans, La.—The Central Laundry Co. at this place consumes approximately 600 tons of coal per annum and is willing to consider making a contract. Address Purchasing Agent, Central Laundry Co., 1100 South Liberty St., New Orleans, La.

+1515—Saratoga Springs, N. Y.—The Commissioner of Accounts received bids until 3 p.m., Sept. 27, for furnishing approximately 200 tons of grate or egg coal, to be delivered at the City Hall. About 100 tons are to be delivered at once and the balance as required. Address Comr. of Accounts Michael J. Mulqueen, City Hall, Saratoga Springs, N. Y.

+1516—Philadelphia, Penn.—The Department of Supplies will receive bids until noon, Oct. 5, for furnishing coal on a deficiency contract until the end of the year, as follows: Queen Lane Pumping Station, 3,400 tons of anthracite buckwheat; Roxborough Auxiliary Pumping Station, 500 tons of anthracite buckwheat; Lardner's Point, 6,400 tons of bituminous; ice boats, 1,000 tons of bituminous. Address Dir. Herman Loeb, Dept. of Supplies, City Hall, Philadelphia, Penn.

1517—Sioux Falls, S. D.—Bids will be received until 2 p.m., Oct. 6 for furnishing and delivering 250 tons of bituminous and 50 tons of anthracite coal. Address Audr. H. H. Howe, Minneapolis County, Sioux Falls, S. D.

+1518—Minot, N. D.—Sealed bids will be received until 8 p.m., Oct. 4, for furnishing screened lignite lump coal to the Public Library. Address Secy. (Mrs.) A. L. Carr, Minot, N. D.

+1519—Hopkins, Minn.—Bids will be received by Hennepin County, until 11 a.m., Oct. 4, for furnishing 100 tons of Youghiogheny screened lump coal f.o.b. switch at Hennepin County farm. Address Audr., Hennepin County, Minneapolis, Minn.

1520—Akron, Ohio—Bids will be received until 11 a.m., Oct. 7, for furnishing Summit County with coal during the ensuing year. The coal is for use at the Court House, Jail and County Infirmary and quotations should be made f.o.b. Erie tracks at Court House and Northern Ohio tracks at Fairlawn. Address Clk. U. G. High, Summit County, Akron, Ohio.

1521—Ottawa, Ill.—Bids were received until 2 p.m., Oct. 1, for furnishing La Salle County with its coal requirements during the ensuing year. The successful bidder must furnish a bond for $2,000. Address Chm. E. P. Nitschelm, Ottawa, Ill.

Contracts Awarded

Note—Successful bidders are noted in **bold face** type.

No. 205—Norristown, Penn.—This contract (Vol. 7, pp. 400, 626, Vol. 8, p. 42), which provides for furnishing the local School Board with anthracite and bituminous coal, previous announcement of the anthracite award having already been made and the bituminous portion has also now been awarded to the **Knickerbocker Coal Co.,** of Philadelphia, at $3.15 per ton for 350 tons of coal delivered. Address Secy. Harry W. Akins, 717 DeKalb St., Norristown, Penn.

1044—Kansas City, Mo.—This contract (pp. 116, 446), which provides for furnishing the fuel requirements of the Sewell Paint and Glass Co., has been awarded to the **Mayer Coal Co.** on deep shaft nut coal. Address Purchasing Agent, Sewell Paint and Glass Co., Kansas City, Mo.

1066—Kansas City, Mo.—This contract (pp. 116, 489), which provides for furnishing the Gillpatrick Laundry Co. with about 100 cars slack coal per month, has been awarded to the **Beatty Coal Co.** on Paris slack at $3.75 per ton. There were no other bidders on this business. Address Purchasing Agent, Gillpatrick Laundry Co., Vine and 15th St., Kansas City, Mo.

+1157—Brookings, S. D.—This contract (p. 199), which provides for furnishing the city government with approximately 20,000 tons of coal, has been awarded to the **Brookings Lumber and Fuel Co.** at $4.60 per ton, delivered in the bins. Address County Audr. G. H. Stoddard, Brookings, S. D.

+1180—Columbia, Mo.—This contract (pp. 244, 446), which provides for furnishing the local Water and Light Department with approximately 8,000 tons of Nos. 3, 4 and 5 washed slack coal has been awarded to **Whittle & Hockaday** at $2.31 per ton. Address Clk. John S. Bicknell, Columbia, Mo.

1192—New Brunswick, N. J.—This contract (pp. 244, 489), which provides for furnishing the city pumping station with approximately 900 tons of bituminous coal to be delivered at Weston's Mills at the rate of 100 tons per month, has been awarded to **Daniel June** at $4 per ton. Address City Clk. E. J. McLaughlin, Dept. of Pub. Affairs, New Brunswick, N. J.

1224—Boston, Mass.—This contract (p. 245), which provides for furnishing the Massachusetts Training School with coal, has been awarded to the **Spring Coal Co.** on the following basis, quotations including cost of delivery at the schools: Lyman School for Boys at Westboro, 800 to 1,500 tons, at $4.13; Shirley Industrial School for Boys, 300 tons at $4.38; Lancaster Industrial School for Girls, 300 to 400 tons at $4.48. Address Executive Secy. F. Leslie Hayford, Massachusetts Training Schools, 274 Boylston St., Boston, Mass.

1251—Redfield, Iowa—This contract (p. 284), which provides for furnishing the Independent School District with approximately 100 tons of coal, has been awarded to **G. W. Armfield,** at $3.75 per ton for 6-in. screened coal. Patty & Bailey bid the same, and the Redfield Brick & Tile Co. bid $4 per ton. Address Clk. R. V. Seaman, Independent School Dist., Redfield, Iowa.

+1252—Minot, N. D.—This contract (pp. 284, 489), has been awarded as follows: **J. S. Wallace,** School No. 1, $3.85; **Oscar Simmonson,** School No. 2, $3.45; School No. 3, $3.20; School No. 4, $4. Address Clk. W. E. Gross, School Dist. No. 7, Minot, N. D.

1265—Hazleton, Penn.—This contract (p. 324), which provides for furnishing the local Board of Education with approximately 1,500 tons of pea and stove coal, has been awarded to the **Lehigh Valley Coal Co.,** at $2.75 for pea and $3.75 for stove, the hauling to be done at 32c. per ton. Other bids on this contract were too high as transportation to a convenient siding in Hazelton makes the cost excessive. Address Secy. D. T. Evans, Hazelton School Dist., Hazelton, Penn.

1272—West Point, Neb.—This contract (p. 324), which provides for furnishing and delivering 150 tons of coal for School District No. 1 at this place, has been awarded to **Weller Bros.,** at $4.85 per ton. Address Secy. J. C. Hansen, School Dist. No. 1, West Point, Neb.

+1299—Columbus, Ohio—This contract (p. 325), has been awarded to the **New York Coal Co.** at $1.25 per ton; this applies to that portion of the contract providing for furnishing 12.000 tons of nut, pea and slack coal to the Ohio Penitentiary at Columbus. Other bids on this business were: Elk Coal Co., $1.30; Ajax Block Coal Co., $1.33; the Seidenfeld-Hammon Coal Co., $1.35; the Jno. M. Taylor Coal Co., $1.25, and the Wm. J. Hamilton Coal and Coke Co., $1.25. The bids for the Cleveland State Hospital and the Columbus State Hospital, each involving approximately 10,000 tons, have also been received. Address Pur. Agt. R. V. Lyon, Ohio Bd. of Administration, Columbus, Ohio.

1337—Wilmington, Del.—This contract (p. 410), which provides for furnishing the Government Engineers with approximately 3,000 tons of bituminous coal, has been awarded to **Chas. Warner Co.,** of Wilmington. Address United States Engineer's Office, Old Federal Bldg., Wilmington, Del.

+1354—Buffalo, N. Y.—This contract (p. 411), which provides for furnishing the Buffalo State Hospital for the Insane with a six months' supply of coal estimated at from 12,000 to 16,000 tons, has been awarded to the **Frick Coal & Coke Co.** at $2.18 per short ton for slack coal f.o.b. the hospital. Address Purchasing Committee, State Hospital, Room 138, Capitol, Albany, N. Y.

+1370—Newark, N. J.—This contract (p. 446), which provides for furnishing the State Board of Education with approximately 250 tons of pea coal for the Normal School, has been awarded to the **S. Smith Coal Co.,** of Kearney, N. J., at $4.24 per gross ton. Paul Bros., of Newark, N. J., bid $4.40 per ton. Address Pres. Joseph S. Frelinghuysen, Dept. of Pub. Instruction, State House, Trenton, N. J.

+1409—Philadelphia, Penn.—This contract (p. 448), which provides for furnishing the Philadelphia County Prison with approximately 600 tons of white ash buckwheat coal to be delivered during October, November and December, has been awarded to the **Philadelphia & Reading Coal & Iron Co.** Address Philadelphia County Prison, 10th and Reed St., Philadelphia, Penn.

Contract Notes

Lucca, N. D.—The contract for supplying the local schools with coal has been awarded to the **Farmers Elevator Co.**

Neosha, Kan.—The contract for furnishing the local Board of Education with coal has been awarded to **P. Ratliff** at $3.60 per ton for Cherokee lump.

Conshohocken, Penn.—A contract for furnishing the local School Board with approximately 200 tons of pea coal has been awarded to **James Tracy & Son** at $4.30 per ton, delivered. Address Secretary, Bd. of Edu., Conshohocken, Penn.

Grosse Pointe, Mich.—The contract for furnishing the local schools with approximately 200 tons of egg and stove anthracite was awarded to **J. & T. Hurley,** of Detroit, at $6.95 per ton. Address Secy. Robert Trombly, Bd. of Edu., Grosse Pointe Village, Mich.

Coshocton, Ohio—The board of control has awarded the contract for the city water-works to **Edgar W. Frock,** on mine-run coal at $1.62½, delivered at the pumping station. The contracts calls for approximately 36 tons a week or 2,000 for the year.

Concordville, Penn.—The P. E. Sharpless Co., butter manufacturers, have entered into a contract for 4,000 tons of bituminous coal to be furnished by the Emmons Coal Mining Co., Philadelphia. Address Purchasing Agent P. E. Sharpless Co., Concordville, Penn.

Omaha, Neb.—The Municipal Water Plant at this place consumes about 50 tons of coal per day, which is bought as required and stored in a large coal pit. The Water Board does not call for competitive bids. Address Purchasing Agent, Water Board, City Hall, Omaha, Neb.

Cando, N. D.—The contract for furnishing the County Government with 150 tons of Hocking Valley coal has been awarded to the **Monarch Elevator Co.** at $6.13 per ton f.o.b. Cando. The contract for furnishing lignite coal was awarded to the **Pipe-Howe Lumber Co.** at $3.20. Address County Audr. F. F. Vaughan, Cando, N. D.

Hampton Roads, Va.—The contract for coaling the interned German cruiser "Kronprinz Wilhelm" (p. 412) provides for furnishing 992 tons of the best Pocahontas coal. The consideration is $2.99 per ton, delivered in lighters alongside and to be taken on board by the ship's crew. Address Paymaster Hassan, steamer "Kronprinz Wilhelm," Hampton Roads, Va.

St. Peter, Minn.—The County Commissioners at this place have awarded contracts as follows: **Nicollet Farmers' Exchange,** for furnishing the poor farm, $5.35 per ton, f.o.b. Nicollet, for screened splint; **Jensen & Lampert** for furnishing the Court House, $5.65 per ton for West Virginia splint screened lump; **Atlas Elevator Co.,** for furnishing the jail, $7 per ton for dock screened Pocahontas smokeless lump.

Norristown, Penn.—The State Hospital for Insane has closed a contract for 10,000 tons of bituminous coal with the **Irvona Coal & Coke Co.,** of Philadelphia, for the period ending Aug. 1, 1916. This institution formerly used anthracite pea and buckwheat, contracting for a supply every three months. After experimenting with bituminous coal for a year they have decided to continue its use. Address Steward Oscar L. Schwartz, Morristown, Penn.

COAL AGE

Vol. 8 NEW YORK, OCTOBER 9, 1915 No. 15

The Two Brothers

We are responsible for much of the progress of the world.

We it is who have made possible the finding of a North Pole, the digging of a Panama Canal, the wresting of electricity from nature, the invention of a telephone.

We have raised up a peasant and set him on the throne of a kingdom.

We make the difference between the slave groping in the mud and the sage who knows the planets intimately.

We pour out our gifts to all those who seek us.

Among our votaries are the old and the young, the rich and the poor, the great and the humble. And to all we give some of our gifts; to some we give all.

Those who labor in the dark caverns of the earth owe us a great debt.

We have sent our followers to carry the sustaining air to the innermost recesses of the mines; to fill the passages with a light as bright as day; to drive out the poisonous vapors and gases that lurk in secret places to destroy the lives of those who labor; to drain the waters from the mines or to convert them into spray to control the treacherous dust.

We have other and personal blessings to bestow. In our gift is gold—the evidence of success. We offer position and power.

We make happy homes that are greater than banks or battleships.

We give strong bodies and clear brains to make the earth an abode of happiness and peace.

We build up righteous communities. We overcome discontent. We banish disease.

We put our followers on a level with all men. We sharpen the sympathies that they may understand the humble. We quicken the intellects that they may take their proper place in the counsels of the great.

We promote health, happiness, faith.

We are brothers—we are called Education and Industry.

By GEO. N. LANTZ, *New Straitsville, Ohio*

Motor Haulage and Side Tracks--I

By George S. Brackett*

SYNOPSIS—In planning a new mine or extending an old one, the coal-haulage system requires careful consideration. This is the first of two articles on this subject. The treatment is not detailed, but rather a general view of the entire problem and a protest against the haphazard, hit-or-miss methods often employed in laying out a mine transportation system.

In planning the development of a mine, the initial consideration is the location of the opening and the laying out of the headings or roads by which the coal must be transported from the working face to the tipple. The next essential is provision for circulating air, which demands that there must be at least two headings. Subordinate to this, but nevertheless important, is the prospective projection of the headings throughout the entire coal area in order that they may reach and exhaust all the sections, points, knobs and windgaps. From the main face heading are broken the main butt headings. These in turn produce face headings and butt room headings, dividing the property into panels or batteries of rooms. It is here in the design of the development that the matter of motor haulage should be considered.

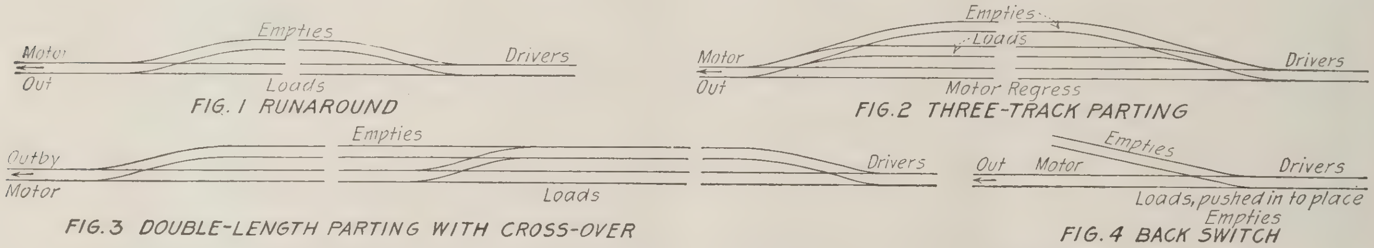

FIG. 1 RUNAROUND

FIG. 2 THREE-TRACK PARTING

FIG. 3 DOUBLE-LENGTH PARTING WITH CROSS-OVER

FIG. 4 BACK SWITCH

FIGS. 1 TO 4. FOUR FUNDAMENTAL SIDE-TRACK ARRANGEMENTS

Much has been published on the question of motor haulage—the track, trolley, hangers, speed, capacity and cost of operation; but the question of the practical design of the general system to conform with different mine workings and the nature and location of the passings and junctions has been scarcely touched.

This article is not a detailed account of motor construction, weights, effective grades, curve and switch limits, but rather a view of the question in its entirety—where the motor should go, the kinds and number of junctions and side tracks advisable and their location. It is a protest against the common method of installing motor haulage without initial consideration and only through necessity when the animal haul becomes prohibitive on account of the distance traversed. In such an instance the motor is installed with its single terminal at a convenient place outside of the first working heading, or if a few of the first headings are on the decline in production, they are abandoned and passed by the main motor haulage, to be exhausted only as the final working retreats toward the mine mouth. It is difficult to place a single terminal side track so that the driver's haul from it to the working faces will be economical throughout.

The major portion of transportation expense is not consumed by the main haulage motor, but rather by the gathering of the coal from the working face to the side track or tracks. Evidently then it is this gathering to which most attention should be given. The actual straight motor haulage must be secondary to the gathering proposition, and if convenient should accordingly be sacrificed to the more expensive operation so as to reduce the gathering expense. The primary object of the main motor haul is to render the gathering more economical. When it fails in this it has fallen short of its most important duty.

Like the system of ventilation, the system of haulage to be adopted strongly influences the planning of the mine workings and headings. In developing any mine of considerable tonnage, the method to be adopted in the motor-line extension should be kept well in mind when the workings are being laid out. The entire property must be considered in this connection. There is little excuse for not having the mine workings provide for the extension of the motor haul the same as they do for the ventilation, so that actual moving of the side tracks forward to keep pace with the advancing workings is not the momentous question which it usually is. The headings, cross-headings and cross-cuts should be laid out so as to conform with the side-track and haulage plan and should be kept clean where the parting tracks are needed.

When gathering is done by motor the necessity for keeping the side tracks advancing is not as important as where animals are used. The economy of gathering by motor is more evident as the distance from the working face to the straight-haul junction increases. Where the motor has the advantage over horses and mules is when it collects 15 or 20 loads and speeds off to the side track 2,000 or 3,000 ft. away. Correspondingly its inefficiency is manifest when it makes a long trip for one or two loads or where the main junction is so close that most of its time is spent in actual gathering to the room necks.

The point of principal importance in laying out motor side tracks is the junction with the horse or mule haulage, and a full understanding of this difficult part of the question requires little other information to adapt it to the junction of express and gathering motors. Most mines do their gathering with animals, while motor gathering is in the minority.

For convenience in description, it is assumed that the main heading is a face heading from which butt or room headings are broken every 300 or 400 ft. The arrangement of the side tracks at the junction points of these headings covers the question completely, as the conditions there existing are identical with the junction points of the main butt and face headings. The problem is accordingly confined to the face main and its butt or room headings.

---

*Flemington, W. Va.

Following the undisputed hypothesis that the motor road must be kept close up to the driver's haul in order to keep the cost of the latter down to its most economic point, the necessity of numerous side tracks is evident.

In some mines there may be certain deficiencies of equipment which prevent this. A single motor may not be able to work all the side tracks that are advisable or there may not be enough mine cars to feed the required number of partings; for the more terminals there are, the more mine cars are needed. These local conditions may prevent temporarily the adoption of the main motor haul which would give the most economical gathering, yet it does not alter the fact that there is a most economical way of handling the coal, and an examination of the cost will show that the additional equipment would be a paying investment.

If one main-haul motor will not feed all the partings that are advisable, there should be two, and if there are not enough mine cars there should be more. There are two ways of looking at every question—what is actually the best way and the cheapest way of moving the coal (this should receive much attention in a mine layout) and what is the best and cheapest way this can be done with the equipment on hand. If additional equipment is not obtainable, it is usually a question of arranging a straight haulage so that there is as little time lost as possible at the terminal, keeping the number of side tracks down with a view to getting them as close to as many workings as possible. This merely approaches the most economic condition and is the best that can be done under the circumstances. The most economic design is one that does not permit any driver to have a haul greater than may be operated efficiently or that allows any motor to take a long journey for less than a full trip. When this exists coal haulage is being done economically.

A mistake frequently made in examining mining costs is a failure to look at the question in proper integral parts. The main haulage is one distinct part and the gathering of the coal another. Each should be handled on the most economical system irrespective of the other. On a properly arranged main or express haulage there is little difference in the transportation cost for a thousand feet or for a mile. The latter haulage is equipped with heavy motors and good track and operates heavy trips. The former worries along with a light motor and usually poorly surfaced track.

There is, however, a vast difference in the economy of mule-gathering over short and long hauls. As the mine workings advance there are constantly changing conditions, and the corresponding readjustment of the haulage to the end that all the integral parts of the system may work at their most economic speed and so that the most frequent delays should affect the fewest possible men. It is no economy to have an hour's delay under the tipple stop the entire mine, motor and drivers for the same period. With properly arranged side tracks, a reasonable surplus of power and empty mine cars and track accommodations for them, there is no reason why the mine should not continue to operate for a reasonable time, holding the loads on the side tracks and tipple tracks until the dumping starts again. The tipple and main haulage should accordingly be sufficient to recover in a short time from the congestion caused by the delay. In other words, in order to keep the greater expense (the gatherers) working steadily, there must be some surplus capacity in the main haulage and tipple. This is an economic arrangement.

The ability of the mine management to meet all the requirements of a motor haul—or all that it is practical to meet—depends on a full and complete knowledge of all the kinks used in motor haulage and side tracks. With this in view I have collected illustrations of all the side tracks that I could in order to embody them for reference.

Figs. 1, 2, 3 and 4 give four fundamental side-track arrangements from which all side tracks or terminals may be constructed or evolved. One of the tracks may be in the main heading and another in a back heading, or part in the main and part in the cross-heading. There may be a combination of some of these forms used to make up the completed partings, but these four are the foundation of all side tracks.

With reference to their use, side tracks may be classed under three different heads with two subdivisions each. These are, 1, junctions of animals and motors—(a) terminal, (b) intra-terminal to feed a heading along a continuous motor road; 2, junction of main and gathering motors—(a) terminal, (b) intra-terminal; 3, for two or more main haulage motors—(a) passing, (b) meeting.

Figs. 5, 6 and 7 illustrate the changes necessary to adapt standard partings for intra-terminal work.

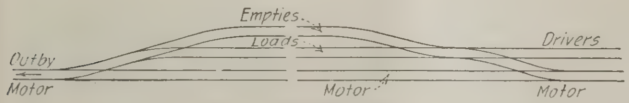

FIG. 5 RUNAROUND

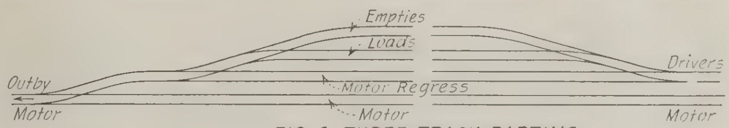

FIG. 6 THREE-TRACK PARTING

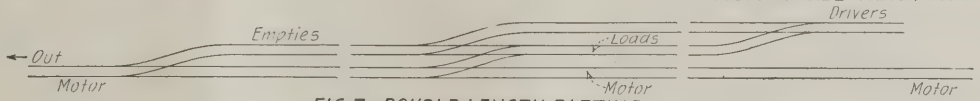

FIG. 7 DOUBLE-LENGTH PARTING

FIGS. 5 TO 7. ADAPTATIONS OF STANDARD PARTINGS TO INTRA-TERMINAL WORK

JUNCTION OF ANIMALS AND MOTORS

We may consider first the simplest form of motor haulage; namely, one motor, one straight track and one terminal side track inside the mine, beyond which lie all the producing sections. The difficulty in the permanent adoption and maintenance of this form is that the forward workings are calling for a closer side track before the complete exhaustion of the older sections will permit an advance. The result is that some workings are often abandoned before they are exhausted, in order to move the parting up to and get it closer to the advancing portion of the mine.

These older sections have passed the prime of their production and are expensive to operate, while the long animal haul from the more favorable section renders their operation expensive. This results in a high operating cost. Had this original terminal side track been first constructed with a view of extending the motor road to pass it as soon as necessary in such a form that it could have been left in position without interfering with the extension beyond, the rear section could have been completely exhausted without delaying the extension of the motor road until the forward driver's haul became extreme and the cost of gathering rose to a prohibitive point.

The main issue, which must not be obscured, is that the motor haul is the means by which the animal gathering may be done economically. The design of the haul should therefore be such that this is accomplished in its maximum. It should reach every section of the mine within a reasonable distance or driver's haul from the point of production. Although this may require additional motor power, it is nevertheless provident. It is not simply a single track with a single terminal placed at such a point as to "strike a happy medium" in accommodating all the workings. It is a series of branches with terminal and intra-terminal partings, each placed so as to give the greatest efficiency in the gathering of the coal from each and every heading or section of the mine until these sections are exhausted.

A side track that serves the purpose of a terminal for the motor haul and at the same time supplies that particular heading at its head when the motor haul is extended to feed the advancing workings without change or alteration is a practical impossibility. This change, however, from a terminal to an intra-terminal side track should be, for the sake of economy, as small as possible and made with the least possible expense. It is an important point in laying out the motor haulage and its side tracks to have in mind all the time the questions, Where will the next parting be? and, Have provisions been made to pass on beyond this in the most economical way?

⁂

Great Lignite Resources of North Dakota

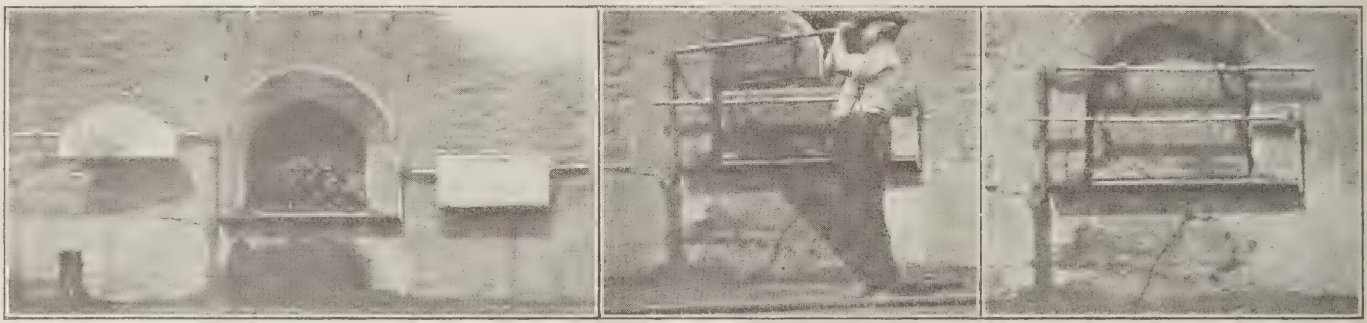
Lignite underlies almost all the western part of North Dakota. It is estimated by the United States Geological Survey that the state contains the enormous amount of 697,000,000,000 short tons of lignite in beds over 3 ft. thick and within 1,000 ft. of the surface, and it seems probable that there is workable lignite within this limit under every section of the land in the western part of the state. It is difficult to form an idea of a mass containing even 1,000,000 tons, and hence the figures given above are practically impossible of comprehension; but if the amount is put in the form of a cube, a better conception of its magnitude may be obtained. The lignite of the state, if formed into one mass in the compact form in which it lies in the ground, would make a cube 5 mi. long, 5 mi. broad and 5 mi. high. Such a cube would cover nearly a township of land and would be almost as high as the highest mountain on the globe.

Much of the lignite, although of poor quality and at present used only in a small way, constitutes a vast fuel resource which will in time become of great value, not only to the individual citizens of the state but to the corporations that are seeking power for use in manufacturing or in transportation.—*Northern Pacific Guidebook,* Geological Survey.

⁂

New Beehive Coke-Oven Door

The use of permanent doors for beehive coke ovens has recently made important advances, mainly because of the economies thereby effected. It is evident that there is a demand for this improvement or there would not be so many types on the market, nor would engineers and practical mining men show such activity in designing new doors. P. J. Tormay, who was for many years superintendent of the Trotter works of the H. C. Frick Coke Co., near Connellsville, Penn., and who is a well-known practical coal and coke expert, has devised and is patenting the door illustrated.



FIGS. 1 TO 3. TORMAY DOOR FOR BEEHIVE OVENS

In Fig. 1 on the left the door is shown open; the center, Fig. 2, shows the atendant closing the upper leaf, and the right illustration, Fig. 3, shows the door completely closed and ready for luting

The hinge part in some respects resembles that of the Lucia door manufactured by the Covington Machine Co. The lining and the methods of retaining it in place are somewhat similar to those of the Auld and McMurray types of doors. The door is fitted to take the plastic clay "daub" which is already well known in the beehive industry, being used by the Taylor Coal and Coke Co., at Searight shaft, Uniontown, Penn., and other concerns.

Door Is in Two Parts and Weighs 300 Lb.

The Tormay door is simple, easily operated and of low first cost. It can be installed for $10 complete, including the lining. No changes have to be made to the oven front such as are necessary with most permanent doors. All such changes add to the cost of installation. The low first cost of the new device should appeal to small operators, as such a door will pay for itself in less than six months from the savings effected in yield and materials.

As will be noted from the illustrations, the doors are in two sections, the lower half being swung to one side of the oven and the upper half to the opposite side, both sections resting on supports in the oven wall. However, both halves may be arranged without any difficulty to swing to the same side. The door has a back, made of ½-in. soft steel, and the daubing clay is retained on it by the extension of the metal from punch holes at regular intervals, which act as substitutes for the rivets, or fingers, in the Auld and McMurray types of door.

The lower half, with the "daub" on it, weighs approximately 160 lb., and the upper half, 140 lb., making a total weight of only 300 lb. for the entire door, including the daub, whereas other types of doors on the market weigh much more. The door has for all practical purposes a "solid back" and will not leak air and thus burn up coke.

DOOR IS INEXPENSIVE, BUT AIR-TIGHT

In Fig. 1 the door is shown open. The coke stands high in front, is well burned and shows no ashes or cutting out in front. The lining of the door faces outward, so that the coke boss can readily see whether it needs repair. In the illustration it is shown burned into a solid brick, with no shrinkage or fire cracks. Cracks that develop on the first firing are easily plastered shut. The door in question has been in service three months, with no repairs of any kind.

Fig. 2 shows the ease with which the door is opened and closed. One man can easily swing it around into place if the hinge is rigid. To take the strain off the hinge, it should be supported as much as possible by the operative in swinging it around.

Fig. 3 shows the door closed. It is luted along the sides with the ordinary loam mortar. Of course somewhat more luting will be required with a door of this type than with some of the others on the market, which are fitted with special iron frames. Especially is this true if the jambs are not kept in good repair. This trouble would not be experienced on plants operated by hand.
